

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

NEW AMERICAN CYCLOPÆDIA.

BROWNSON

BROWNSON, ORESTES AUGUSTUS, LL. D., an American author, born at Stockbridge, Vt., Sept. 16, 1808. His early life, passed chiefly with old people in a lonely locality, was without the sports and charms which usually belong to childhood. He was taught the assembly's catechism, the apostles' creed, and the Lord's prayer; and, with a fondness for reading, had for books almost nothing but the Scriptures and a few religious treatises. Hence his thoughts took a deeply religious turn; and at 9 years of age, having been permitted to witness a general military muster, and being asked what he had seen to interest him, his answer was, that he had seen two old men talking on religion. In fact, he had forgotten the soldiers to listen to a debate on election and free-will, in which he himself took part. One of his earliest aspirations was to become a clergyman. In his 19th year, he joined the Presbyterian church at Ballston, N. Y., where he was attending an academy, but soon meeting with men of various religious opinions, he changed his views after much argumentation and a period of perplexity, and became, in 1825, a Universalist minister. He preached in different villages of Vermont and New York, and wrote for and edited various religious periodicals, disseminating a confused medley of bold thoughts. His ecclesiastical position had grown into disfavor with him, when, making acquaintance with Robert Owen, he was fascinated by schemes of social reform; and in 1828 he was prominent in the formation of the working-men's party in New York, the design of which was to relieve the poorer and more numerous classes by political organization. Of the effectiveness of this movement he presently despaired, when the writings of Dr. Channing drew his attention to the Unitarians, and in 1832 he became pastor of a Unitarian congregation. He now enjoyed the acquaintance of many cultivated persons; was introduced to the French and German literatures; and began the methodical study of philosophy and theology. His chief advisers were the works of the French philosophers, and the most important result of his study was a conviction of the necessity of a new religious organization of mankind, which should render the religious senti-

ments efficient in society, and give to faith, love, and union the supremacy over disbelief, uncertainty, and individualism. In 1836 he organized, in Boston, the "society for Christian union and progress," of which he retained the pastorate till he ceased preaching, in 1843. Immediately after removing to Boston, he published his "New Views of Christianity, Society, and the Church," remarkable for its protest against Protestantism; and in which, by speculations akin to those of Benjamin Constant and the St. Simonians, he looked to the immediate future for a transformation of religious and social ideas and institutions. In 1838 he established the "Boston Quarterly Review," of which he was proprietor, and almost sole writer, during the 5 years of its separate existence, and to which he contributed largely during the first year after it was merged into the "Democratic Review," of New York. It was designed not to support any definite doctrine, but to awaken thought on great subjects, with reference to speedy and radical changes. To this end also he published, in 1840, "Charles Elwood, or the Infidel Converted," a philosophico-religious treatise, in the form of a novel. This book has passed through several editions in England, but as the author soon afterward changed his views on the subjects treated in it, he declined to have more than one edition issued in this country. In his sermons, essays, and books, he had pushed abstract principles to speculative results, and, as he afterward said, had accepted and vindicated nearly every error into which the human race has ever fallen. Having gone in one direction about as far as was possible, and meeting with little either of sympathy or success, he began to suspect that man was not made for a church-builder, but that God himself had founded a church centuries since, fully adapted to the nature and destiny of human beings. This reactionary tendency in his thoughts was encouraged by a course of reasoning; and the ultra iconoclast in institutions, and "chartered libertine" in doctrine, began to look to the Roman Catholic church as the organization which he had vainly endeavored to construct for the redemption of humanity. With his entrance into the Roman communion, in

1844, the romance of his intellectual career terminates, and he has since been laboring strenuously for the doctrines of that church. His course as a metaphysical thinker runs parallel with his ecclesiastical career. At one time a sensationalist, he passed to the sentimental or intuitionist philosophy, and was one of the earliest admirers of Cousin in this country. Two articles which he published on eclecticism in the "Christian Examiner," in 1837, were noticed and applauded by Cousin in the preface to the 8d edition of his *Fragments Philosophiques*. After devoting more attention to philosophy, he embraced rationalism. A later persuasion of the necessity of what may be called the traditional element, made him a Catholic in religion, and produced in his philosophy a union of the two systems of traditionalism and rationalism, which is substantially his present doctrine. The method which he adopts in his system is the distinction between intuition (direct perception) and reflection (indirect or reflex knowledge). The mind is unconsciously intuitive; it does not, in intuition, know that it has intuition of this or that truth, because as soon as it knows or is conscious of the intuition it has reflex knowledge. Reflection can contain nothing which is not first in intuition. In order to reflect on that which we know intuitively, we must have some sensible sign by which the mind may apprehend or take hold of it. Such a sign is language, both in the ordinary and figurative sense of the word, which thus holds in the metaphysics of Mr. Brownson a place corresponding to that which tradition holds in his religious system. The knowledge of God, he maintains, is intuitive. The ideal element of every intellectual act is God creating creatures, *ens creat existens*. The later publications of Mr. Brownson are the "Spirit Rapper," in 1854, and the "Convert, or Leaves from my Experience," in 1857. Since 1844 he has supported almost single-handed, in Boston and New York, "Brownson's Quarterly Review," devoted especially to the defence of Catholic doctrines, but also discussing the questions in politics and literature with which the public mind is occupied. An attempt was made by Dr. John H. Newman and others to persuade him to accept a chair in the new Irish university in Dublin, but he preferred to continue his labors in his native country. Translations of several of his works and essays have been published and favorably received in Europe, and his "Review" is regularly republished in London simultaneously with its appearance in this country.

BROWNSVILLE, a post borough of Fayette co., Penn. It is situated on the Monongahela river, where it is crossed by the national road. A bridge over the river has been erected here at a cost of \$50,000, and a 2d bridge, of cast-iron, over Dunlap's creek, connects Browns-ville with the neighboring borough of Bridgeport. In the vicinity are rich mines of bituminous coal. The Monongahela is navigable to this point for large steamboats. The borough

was incorporated in 1815, and contained in 1853 about 4,500 inhabitants, who are extensively engaged in various manufactures, and in steamboat building.

BROWNSVILLE, formerly Fort Brown, a post town, capital of Cameron co., Texas, on the left bank of the Rio Grande, opposite Matamoras, and about 40 miles from the gulf of Mexico. It is easily accessible by steamboats, and its advantageous situation and trade with Mexico have rendered it one of the most prosperous and populous towns of the state. The value of its imports in 1852 was estimated at \$5,000,000. It contains a custom-house, 2 newspaper offices, and 3 churches; pop. in 1854, about 5,000.—At the commencement of the war with Mexico, in 1846, the U. S. troops under Gen. Taylor occupied this place, threw up a strong work, and, leaving in it a small garrison, marched to the relief of Point Isabel, on the coast, where their supplies were threatened. In the mean time the Mexicans, under cover of the guns of Matamoras, erected batteries, and on May 4 commenced a bombardment of the fort, which lasted 160 hours. The Americans defended themselves with spirit and success, maintaining their position until the surrender of the city to Taylor, but losing their commander, Major Brown, who was killed by a shell on the 6th. It is in honor of this officer that the town was named. It has of late years been the starting point of several unsuccessful filibuster expeditions into the Mexican territory.

BROWNSVILLE, the capital of Haywood co., Tenn., is situated in the midst of a rich, level country, is surrounded by cotton and maize plantations, and is the centre of an active trade. It contains a female college under the direction of the Baptists. Pop. 1,000.

BRUAT, ARMAND JOSEPH, a French admiral, born at Colmar, 1796, died in 1855. In 1843 he was governor of the Marquesas islands. In 1848, after having, under the administration of Cavaignac, officiated for a short time as prefect of the port of Toulon, he was appointed governor of Martinique and commander of the naval depot in the Antilles, of which he became governor-general, March 12, 1849. In 1852 he became a member of the board of admiralty, and in the following year commander-in-chief of the ocean squadron. In 1854 he served in the fleet in the Black sea as vice-admiral, under Admiral Hamelin, and took an active part in the first bombardment of Sebastopol. On Dec. 8 he took the place of Hamelin, and was on the point of returning to France when, after leaving the port of Messina, he died of the cholera.

BRUCE, a noble family of Scotland, 2 members of which occupied the throne, after one had pretended to it in vain.—ROBERT, 7th lord of Annandale, was one of the 13 claimants of the crown in 1290, when, by the demise of Margaret, the "maiden of Norway," the posterity of the 8 last kings of Scotland had become extinct, and the succession reverted to the posterity of David, earl of Huntington, and younger

brother of King William, the Lion. The question of succession speedily resolved itself into a simple alternative between 2 competitors, John Balliol, the great-grandson of David by his eldest daughter, Margaret, and Robert Bruce, the grandson of David by his 2d daughter, Isabel. The contest was, by mutual consent, referred for decision to King Edward I. of England, who pronounced, in accordance with principles that would not now be disputed, that "in all indivisible heritages the more remote in degree of the 1st line of descent is preferable to the nearer in degree of the 2d," and thus gave the kingdom to Balliol, from whom he required homage and fealty. Bruce now retired to England, took service in the English army, and fought against Balliol in the war which resulted in the subjugation of Scotland to England. He returned by his English estates soon after the resignation of Balliol, passed the last years of his life in the deepest contempt among the more patriotic of his countrymen, and died about 1296. —ROBERT, son of the preceding, earl of Carrick and Annandale, constantly followed the fortunes of Edward, and fought bravely against Wallace and the patriot party of Scotland. After having assisted in defeating Wallace at Falkirk, he is said to have had an interview with him on the banks of the Carron, to have been affected to tears by his patriotism, devotion, and misfortune, and to have sworn to join the national standard. This scene is the subject of a poem by Mrs. Hemans. From this time he slackened his zeal for England, but did so little for the national cause that he was able to make his peace with Edward when, a little later, after the capitulation at Irvine, Wallace was driven with his adherents into the northern mountains.—ROBERT, son of the preceding, earl of Carrick, and afterward king of Scotland, born March 21, 1274, died July 9, 1329. He acted at first as Edward's hegemon, but vacillated between the 2 parties, taking no very active part in the struggle between Wallace and England, but inclining to the national cause when a gleam of success enlivened the hopes of the patriots; and, at the approach of Edward, making his peace with the conqueror. He was one of those consulted by the king in the settlement of Scotland as an English province, and was permitted to retain the extensive lands of his ancestors unalienated. It chanced in 1306 that Comyn, the son of Balliol's sister, a nobleman near to the crown, and already distinguished by his efforts to recover the independence of his country, arrived in Dumfries about the same time with Bruce. By appointment, he met Bruce alone in the church of the Minorites, who there stabbed him with his dagger; whether by premeditated treachery or in a sudden fit of passion cannot now be ascertained. Bruce hurried to the church door bloody and agitated, and to the inquiries of his attendants replied: "I think I have killed Comyn!" "You think!" exclaimed one of the number—"I make certain!" and rushing with the others

into the church, despatched the wounded nobleman. The Scotch historians have fabricated a tale to palliate an act which was in harmony with the turbulent spirit and bloody disposition of the age and country, and the motives of which, instead of feeling disgraced, prided themselves on the deed as an exploit, one of them assuming as his crest a bloody hand holding a dirk, with the legend for a motto, "I make certain." By the murder of Comyn, Bruce had staked his life, and could save it only by winning a sceptre. He assumed the title of king, summoned the Scots to his standard, and was crowned, without any opposition, at Scone. Edward immediately sent Aymer de Valence, earl of Pembroke, with a great army to chastise the rebels. The force of Bruce was almost immediately destroyed, 5 of his best knights made prisoners, and he himself, thrown from his horse, was rescued only by the devotion of Seaton. For 2 months, with his brothers and the ladies of his household, he wandered to and fro in the wilds of the Grampian hills, living as an outlaw on the deer of the hills and the salmon of the streams, till his party being discovered, defeated, and forced to separate, he buried himself for concealment in the lonely island of Rathlin, on the north of Ireland. His 2 brothers, wife, and sister, 3 ecclesiastics in full armor, and others, were captured; and the brothers were soon after hanged at Carlisle, and the prelates and ladies were imprisoned in various parts of England. In the spring of 1307 Bruce returned from his retreat, surprised his own castle of Carrick, defeated small parties of English in many skirmishes, and was enabled to maintain himself among the hills and forests, until Edward, indignant at the partial success of men whom he regarded as outcasts from chivalry and forsworn felons, called out the army of his realm and marched toward the lochs, but died on his way, leaving to his son a charge not to bury his bones till he had borne them in triumph from Berwick bounds to the utmost highlands. For 3 years Edward II. paid no attention to his father's advice or the Scotch war, but in the autumn of 1310 he marched into Scotland as far as the Forth without encountering an enemy, for Bruce wisely declined to give him battle. In the next year he sent his favorite Gaveston to renew the war, who penetrated beyond the Forth, but still gained no advantages, Bruce constantly retreating before him, keeping the hills where he could not be assailed, and harassing the English by constant petty skirmishes, in which he mostly worsted them. The following years were passed by Edward in ignoble contentions with his parliament, and by Bruce in gradually but surely recovering all that he had lost in Scotland, until, in 1314, the strong hill fortress of Stirling alone held out for the English, and even that the governor, Mowbray, had been forced to consent to surrender if it should not be relieved before the feast of St. John the Baptist. This at length aroused Edward, who, at

the head of a large army, encamped in the neighborhood of the beleaguered fortress, and was there met by Bruce at the head of 80,000 picked men, on the eve of the festival fixed for its surrender. The battle of Bannockburn, which succeeded, was the bloodiest defeat which the English ever suffered at the hands of their Scottish neighbors. It fixed the crown securely on the head of Bruce, and at once enabled him to exchange his prisoners, who were of the highest rank in England, against his wife, his sister, and his other relatives, who had languished so long in captivity. After this success the Scottish people assumed the offensive and invaded Ireland, where they at first gained considerable successes, and of which Edward Bruce was crowned king. While the dissensions lasted between Edward and his barons, Robert Bruce repeatedly devastated the borders and all the north of Yorkshire, even to the walls of York, into which he on one occasion chased Edward in disgrace, narrowly failing to make him prisoner. In 1323 this bloody war, which had raged, with few pauses, for 28 years, was brought to a close by a truce concluded between the 2 kingdoms for 13 years, to remain in force even in the event of the death of one or both of the contracting parties. Four years after this Edward II. was compelled to abdicate in favor of his son, Edward III., and Bruce, seeing his occasion in the distracted state of England, renewed the war, with the avowed intention of forcing Edward to renounce his claim of sovereignty over the crown of Scotland. In 1328 this renunciation was made; Scotland was declared sovereign and independent; Jane of England, the sister of Edward, was affianced to David, prince of Scotland; and Robert Bruce paid £20,000 sterling to defray the expenses of the war. He died the next year, having, after a life of incessant toil and warfare, secured the independence of his country and won the crown, which he left undisputed to his son.—**DAVID**, son of the preceding, king of Scotland, born about 1320, died in 1370. Shortly after his accession, at the age of 9 years, his kingdom was invaded, and his crown wrested from him, by Edward Baliol, son of that John Baliol whom Edward I. had compelled to resign the crown. In support of his claim Edward III. maintained a fierce strife on the borders, in active though undeclared hostilities to the Scots. David, with his young queen, Jane of England, escaped to France, where he resided till 1341, when, the nobles Murray, Douglas, and Stuart having expelled Baliol from the throne into the northern counties of England, he ventured to return. In 1346, while Edward III., with the flower of his army, was absent in France, David suddenly invaded England, at the head of 80,000 infantry, mounted for the march on galloways, and of 3,000 men-at-arms. But a small army of English had collected themselves secretly at Aukland park, in Durham, composed of 1,200 men-at-arms, 8,000 archers, and about 7,000 vassals

of the church, officered by clergymen and others, and animated by the presence and exhortations of Queen Philippa. The English fought desperately, though with no regular leader, and the Scottish troops were totally defeated, leaving 15,000 men dead on the field of battle and their king a prisoner. From this time until 1357 David was detained a prisoner in the tower of London, when he was liberated after the battle of Poitiers, on the agreement to pay 100,000 marks in 20 half-yearly instalments, a truce being sworn to and hostages interchanged between the 2 countries. This truce was afterward extended to 25 years further, under the name of the great truce, which, David Bruce dying shortly after its ratification, was faithfully observed by his successor, Robert, the first of the Stuart kings of Scotland.

BRUCE, EDWARD, Lord, a Scottish judge and politician, born in 1549, died Jan. 14, 1611. In 1594 he was sent to remonstrate with Queen Elizabeth on the countenance she gave to the earl of Bothwell, and though she would not deliver Bothwell up, she compelled him to leave her dominions. In 1598 he went a second time to England on an unsuccessful mission to induce Elizabeth to acknowledge James VI. as her successor. In 1601, having again gone to England with the earl of Mar, to intercede for the ill-fated earl of Essex, and arriving after his execution, they adroitly converted their mission of supplication into one congratulating Elizabeth on her escape from the conspiracy. Owing to the judicious conduct of Bruce, the undisputed accession of James on the death of Elizabeth took place. Bruce, knighted and created Baron Bruce of Kinloss, accompanied James to England in 1608, and was made privy councillor and master of the rolls.

BRUCE, JAMES, a Scotch traveller, born at Kinnaird, Dec. 14, 1780, died April 27, 1794. He was educated in London and in the university of Edinburgh, and abandoned the profession of advocate, to which he had been destined, for a mercantile life. His wife dying soon after his marriage, he sought diversion from his grief in travel, made the tour of the continent, and at Madrid studied the numerous Arabic MSS. in the Escorial, but was forbidden by the Spanish government to publish them. He returned to England, engaged in studying the oriental languages, particularly the Ethiopian, and renounced commerce in 1768 to accept the consulship at Algiers. He was soon after selected by Lord Halifax to undertake what had baffled curiosity and power since the age of Cambyzes, namely, the discovery of the source of the Nile. He left Algiers in 1765, visited rapidly Tunis, Tripoli, Rhodes, Cyprus, Syria and Egypt, and in Feb. 1770 reached the city of Gondar, where he began his explorations for the head of the Nile. After remaining 2 years in Abyssinia, and visiting the source of the Bahr-el Azrek, which he mistook for the true Nile, he returned through Nubia and Egypt, narrowly escaping the plots of the savages and

the whirlwinds of the desert, and arrived in Europe while the report of his death was current. The narrative of his voyages, published at Edinburgh in 1790, excited universal interest.

BRUCE, MERRIAM, a Scottish poet, born at Finneswood, in the county of Kinross, March 27, 1746, died there, July 6, 1797. His parents were poor, but he was educated to become a minister of the sect called Burghers, of which they were members. At Edinburgh, among others, he became intimate with Mr. John Logan (himself subsequently a poet), who eventually collected and edited his friend's poems. By the time that Bruce was 18 he was attacked with consumption, and his spirits became depressed by illness and poverty. To obtain subsistence he now taught school in a country village for some time. Shortly before his demise he wrote his "Elegy."

BRUCIA, a bitter alkaline body, associated with the similar bodies, strychnia and ignavia, in the milk vesicles and beans of St. Ignatius. It is crystallizable, soluble in hot and cold water and alcohol, and possesses similar medicinal properties to those of strychnia. As it has only about $\frac{1}{2}$ the strength of strychnia, this is used in preference. It was originally discovered by Pelletier and Caventou in the false Anagostura bark.

BRUCK, KARL LUDWIG, baron, Austrian minister of finance, born Oct. 12, 1798, at Elberfeld. In early life he was a merchant's clerk in Bonn. Afterward he took a part in the campaign of 1814-'15, and in 1821, after an unsuccessful effort to obtain employment from the East India company in London, he went to Trieste, on his way to Greece, where he intended to join the war of independence, but the merchants of Trieste induced him to resume commercial pursuits, and in 1823 he married the daughter of a merchant there, and made that city his home, acquiring wealth and influence by successful trade. It was owing to his exertions that the Trieste underwriters formed an association under the name of *Lloyd Austriaco*, of which he was director until 1848. His object was to simplify the extensive insurance business of Trieste, and at the same time to organize direct steamboat connection between Trieste and the Mediterranean and Levantine ports. This was so successful that the government conferred upon him the rank of baron, and subsequently appointed him its ambassador at the Frankfort parliament, in which the citizens of Trieste elected him as their representative. After the Viennese revolution of Oct. 1848, he was called upon to join the Schwarzenberg cabinet as minister of commerce and public works. He was active in the establishment of tribunals of commerce, in the reform of the post-office and the diplomatic service, in the organization of telegraphs and railways, and in the creation of an Austrian maritime and commercial code. The adoption of the constitution of March 4, 1849, was in a great measure due to his exertions; he negoti-

ated the treaty of peace with Sardinia; and his memorable project of a commercial union between Austria and the German states was submitted to the respective governments in 1843, and again in 1850. In May, 1851, he withdrew from the cabinet, as he protested against the extravagant measures of the finance minister. In Dec. 1852, he concluded a commercial treaty between Austria and the German customs union; in 1853 he received the appointment of intendant at Constantinople. He opposed the declaration of war by the sultan in 1855, and objected to the passage of the British fleet through the Dardanelles. He negotiated the convention of June, 1854, by which Austria gained a strong military position on the Danube so far as to the Pruth, without incurring any further obligation than that of defending the same. Since March 10, 1855, he has presided over the financial department in the Austrian government.

BRUCKENAU, a town of Bavaria, on the Sim. It contains a royal castle, and is situated in the midst of beech forests and beautiful mountain scenery. Near the town stands a Franciscan convent, and about 2 miles distant, in the valley of the Sim, are the chalybeate springs and baths of Bruckenan. A pomprium has been erected here by the present king, and in the summer season the place is frequented by the Bavarian court.

BRUCKER, JACOB, a German divine and historian of philosophy, born in Augsburg, Jan. 22, 1696, died Nov. 26, 1770. His great work is the *Historia critica Philosophiæ*, from the creation of the world to his own times, 5 vols. 4to, Leipzig, 1741. It went through 2 editions during the life of its author, and since his death has been repeatedly abridged, and freely used by historians of philosophy.

BRUEYS D'AIGALLIERS, FRANÇOIS PIERRE, count, a French admiral, born in 1703, killed at the battle of Aboukir, Aug. 24, 1798. He was the commander on that occasion, and while descending the quarter deck of his flag-ship was almost cut in two by a cannon ball. His officers attempted to carry him below, but he refused, exclaiming that "an admiral of France should die on his quarter-deck." Brueys had hardly expired when the magazine of his vessel took fire, and she was blown into ten thousand fragments.

BRUEYS, DAVID AUGUSTE DE, a French theologian and dramatist, born at Aix, 1640, died at Montpellier, Nov. 25, 1723. He first embraced the cause of Protestantism, and was subsequently by the influence of Bossuet converted to Catholicism, and henceforth wrote zealously in its defence.

BRUGES (Flemish, *Brugge*), a circle in the Belgian province of West Flanders, with a population of 122,500, and a capital of the same name, the population of which has diminished from 250,000 in former times to about 50,000, of whom not less than 15,000 are paupers. Bruges is connected with

the ocean by the canal of Ostend, and by numerous canals and railways with the other parts of Belgium. It possesses spacious docks and excellent quays, which admit about 100 vessels of 200 to 300 tons. The shipowners of Bruges are engaged principally in fishing and coasting. Lace is the most important branch of manufacture, and there are also manufactories of linen, cotton, and woollen goods, of soap, leather, tobacco, and porcelain. The fine quality of the water in the canals enhances the success of the dyeing establishments. The town presents a quaint and curious aspect, contains about 200 streets, 9 public squares, 54 bridges, and several beautiful fountains. The church of Notre Dame, with a sculptured virgin and child, supposed to be by Michel Angelo, the cathedral of St. Saviour, and the hospital of St. John, are remarkable for the treasures of art and monuments which they contain. The belfry tower in the great square is the finest structure of the kind in Europe, and its chimes, which are the most beautiful in Belgium, sound at every hour of the day and night. Bruges possesses a flourishing free academy of fine arts, a botanical garden, a library, a museum, a fine theatre, an agricultural society, an exchange, a commercial and other tribunals, a gymnasium, and a remarkably large number of charitable institutions. The corporation of weavers of Bruges was celebrated in the time of Charlemagne. From the 9th century till the middle of the 14th, the town was under the sway of the counts of Flanders, who contributed much to stimulate its prosperity, which reached the height of its splendor early in the 15th century, after having passed under the dominion of the dukes of Burgundy. Factories were established here by merchants from 17 states, 20 foreign ministers were accredited to its court. Philip the Good instituted the order of the golden fleece in honor of the remarkable prosperity of the woollen trade of the town. Bruges was then one of the great commercial emporiums of the world, one of the leading commanderies of the Hanseatic league, the centre of resort for English, Lombard, and Venetian merchants, the great mart to which Constantinople, Genoa, and Venice sent their precious argosies laden with eastern produce, Persia its silk, England its wool, and India its spices. The merchants of Bruges had a large share of the business of the globe, while their manufacturers, especially in tapestry, excelled all their contemporaries. A native of Bruges established the gobelins in France under Henry IV.; another, named Berkes, discovered the secret of polishing the diamond. Hans Hemling and the brothers Van Eyck, practised their art at Bruges, and the fine arts had a full share of the general flourishing condition of the town. This great prosperity, however, engendered extravagant habits in dress and social life to such an extent that Charles V. was obliged to pass stringent sumptuary laws. The dominion of the house of Hapsburg proved fatal to the

prosperity of the town. The citizens, who had always been noted for the jealous care with which they guarded their privileges, imprisoned the Austrian archduke Maximilian for violating them, and to punish the town the trade was transferred to Antwerp, and its ruin was finally consummated by the persecutions of the duke of Alva at the end of the 16th century, when many of the inhabitants fled to England, where they introduced some of their native arts and manufactures. The town was on 2 occasions the asylum of English kings: once when Edward IV. fled from England, and again during the exile of Charles II., the latter inhabiting a house which still stands on the south side of the great square, at the corner of the rue St. Amand, bearing the sign, *Au lion Belge*.

BRUGES, HENRI ALPHONSE, vicomte de, a field-marshal under Louis XVIII., born 1764, died Nov. 4, 1820, served in his youth in the English navy in the expedition against Toussaint-Louverture, devoted himself subsequently to the cause of the Bourbons, followed the duke of Angoulême to Spain, and after the battle of Waterloo negotiated with the allied powers on the subject of the prisoners of war.

BRUGES, ROEGE VAN, a Flemish painter and pupil of John van Eyck. He flourished in the middle of the 15th century, and was probably the same person as Magister Rogel, of Flanders, who painted in 1445 three pictures in one, which were presented by Don Juan II. to the Carthusian church at Miraflores. He was one of the few painters of his time who painted on canvas.

BRUGG, or BRUCK, a circle in the Swiss canton Aargau, on the Aar, with 12 parishes, fertile valleys, with manufactures of hosiery and straw goods, and other goods, and a population of 17,800.—The capital, of the same name, with a population of 1,150, is surrounded by walls, defended by conical towers, and is built on a portion of the site of the ancient Vindonissa, some remains of which are still to be seen. In the vicinity are the ruins of the ancient castle of the counts of Hapsburg. The ruined abbey of Königsfelden is in the same neighborhood. The town is the centre of an active transit trade. An old bridge across the Aar at this place is the origin of its name. During the reformation, Brugg was called the *Prophetenstädtchen*, or the little town of prophets, from the many theologians who were born here.

BRÜGGEMANN, KARL HEINRICH, a German journalist, born Aug. 29, 1810, was implicated in the movement of the Heidelberg students of 1830, and for some time detained in prison. Since 1845 he has been editor-in-chief of the *Kölnische Zeitung*, one of the most influential papers in Germany.

BRUGMANS, SEBALD JUSTINUS, a Dutch physician and naturalist, born at Franeker, March 24, 1763, died in Leyden, July 22, 1819. He was first appointed professor of botany and afterward of natural philosophy at Leyden. On the

death of Voltelin he was made professor of chemistry, and in 1795 he was called to assist in organizing the military-medical department of Holland. In 1805 he and some other eminent Dutch physicians published the *Pharmacopœia Batava*; subsequently he was appointed chief physician of King Louis Bonaparte and councillor of state, and on the annexation of Holland to France, Napoleon raised him to the rank of inspector-general of the sanitary department in the French army. About the same period he was also elevated to the rectorship of the university of Leyden. On the accession of the prince of Orange he was made president of the medical departments in the civil, military, and colonial services of the Netherlands. He now re-established at the Hague the central laboratory of chemistry and pharmacy, which he had founded in 1795, but which had ceased to exist. During the campaign of 1815 the humanity of Bruggmans was eminently conspicuous, and known as distinction between allies and enemies. He was appointed in 1815 to bring back from Paris the objects of natural history which had been appropriated by the French during their occupation of the Netherlands.

BRÜHL, I. HENNING, count, a German statesman, to whom Augustus III. of Saxony was chiefly indebted for the crown of Poland, born in 1700, died in Dresden, Oct. 28, 1763. His obscurity and fastery gave him through life complete dominion over the mind of his master. Augustus, on becoming king of Poland, had embraced Roman Catholicism, and Brühl, in order to ingratiate himself still more with his sovereign, presently did likewise. His extravagance exhausted the public revenue, and covered his government with disgrace. On the death of Augustus in 1763, he was dismissed from office, which had such an effect on him, that he died in a few days after. The celebrated palace of Brühl, in Dresden, was named after him. II. HANS MOURIZ, count, a nephew of the preceding, born at Wiedera, Saxony, Dec. 20, 1736, died in London, Jan. 23, 1808. He was educated at Leipzig; held a diplomatic position in 1755; was sent to Warsaw in 1759, and in 1764 was appointed ambassador in London. Here he married, and ever afterward made England his home, devoting many years of his life to the study of astronomy and kindred sciences. He built 2 observatories, one in London and the other at Harfield. Through life he was distinguished for great mechanical skill, displayed in the improvement of planes and chronometers, and in the construction of astronomical instruments. In the various contrivances for determining the longitude at sea he particularly interested himself. He corresponded diligently with all the leading astronomers of his day, such as Zuck, Fischer, Bode, Lalande, Piazzi, and the elder Herschel. The first named speaks of his patronage of learning and his scientific labors in terms of unbounded praise. In 1805, his infirmities induced him to abandon his astronomical ob-

servations and he presented his library and instruments to the Leipzig observatory. He was a celebrated chess player. III. KASPAR EMANUEL MOORE'S PAUL, born at Dierden, May 18, 1773, died in Berlin, Aug. 9, 1857. He acquired some celebrity as editor of a theatrical journal, and as a promoter of the drama by private theatricals at Wolmar. A performance of Thomas Moore's *Lalla Rookh* took place in the royal palace of Berlin in 1833 under his direction. In the latter part of his life he presided over the royal museum of art in Berlin.

BRUIN, JAN VAN, a Dutch philosopher and mathematician, born at Gorcum in 1620, died in Utrecht in 1675. He was a skilled dissector of animals, an able experimentalist, and an excellent astronomer. He was also a supporter of the Cartesian philosophy, and once engaged in a discussion with Vosius in defence of it.

BRUIN, EUGÈNE, a French admiral, born in St. Domingo in 1750, died in Paris in 1800. He was chosen by Napoleon to take command of the flotilla which was to convey across the channel the army destined to invade England.

BRULLOW, KAM PAVLOVICH, a Russian painter, born in St. Petersburg, 1799, died near Rome, June 23, 1858. He enjoyed a high reputation in his native country, and officiated for several years as professor of historical painting at the Russian academy of fine arts.

BRUMAIRE, THE ELEVENTH. In the new distribution of the almanac, which was attempted, among other more important changes, by the French revolutionists, the 9th of November came to be called the 15th Brumaire. It is famous in history as the day on which Napoleon began to put in execution his project for changing the republic—the fruit of all the agony and blood of the revolution—into a military monarchy. After his return from the East, and his triumphant progress from Fréjus to Paris, 1799, he was indicated no less by circumstances than by his own eminent ability, and his own wishes, as the nucleus of all the disaffected and ambitious elements which conspired for a change of government. France was then controlled by a directory of 5 members, a senate or council of the ancients, and a popular legislative branch, or the council of 500, organized according to the constitution of the year III. As a whole, it was an incapable and inefficient government, and in the general estimation greatly needed improvement. The republicans, with a majority of the council of 500, and Generals Bernadotte, Jourdan, and Angerau, wished to restrain the power of the directory, and discharge Barras, one of its members, but to uphold the constitution; Sieyès, one of the directory, with a majority of the ancients, desired some less democratic organization; Barras and the other directors wished to maintain their own power; while Bonaparte and his brothers, assisted by military officers and certain plotting civilians, were ready for any change, provided the effect of it would

be to throw the supreme power into their own hands. Accordingly the latter formed a conspiracy, with Sieyès and his friends, for the complete overthrow of the government; and to prepare the way for it, they invented reports of dangerous plots on the part of the Jacobins, which alarmed the timid and the friends of order generally. The day set apart for the execution of their scheme was the 18th Brumaire. Sieyès was given the council of ancients to manage; Napoleon undertook the military; and Lucien Bonaparte, who was president of the council of 500, that important body. As a last resort, however, as in all such cases, their reliance was upon the army, with which Bonaparte was an immense favorite. At 6 o'clock on the morning of the 18th, the ancients (with the exception of the republican members, who had not been notified) were assembled at the Tuileries. Sieyès aroused their fears by an animated address on the dangers of the republic, the plots of the Jacobins, and a meditated return of the reign of terror, and persuaded them to transfer the meeting of the legislative bodies to St. Cloud, on the pretence that they would there be out of danger. He also persuaded them to appoint Bonaparte commander-in-chief of the military division of Paris. The removal of the chambers they had a right to effect by the constitution; but this appointment they had no right to make, yet it was made. Bonaparte at once made his arrangements for the disposal of the troops. Sieyès and Ducos resigned as members of the directory; Barras, another member, corrupt and cowardly, made secret terms with Bonaparte and also resigned, whereby the other two members, Moulins and Gohier, were left in a minority. Thus there was in reality no executive government; and the council of 500, which met at 11 o'clock, found that their session had been adjourned to the next day at St. Cloud. On the 19th Brumaire (Nov. 10), the two councils met at St. Cloud. The republican minority of the ancients complained fiercely of the trick by which they had been left out of the proceedings of the previous day, when Napoleon appeared at the bar to justify the action. In the midst of considerable tumult, in which he spoke of volcanoes, conspiracies, traitors, &c., he lost his presence of mind, his language became confused and incoherent, and he did not recover himself till he caught a glimpse of the grenadiers outside, when he threatened the assembly with the army, if it dared to decide against him. In the council of 500 a more violent scene was enacted. Lucien Bonaparte read the resignation of the directors, the assembly shouting: "No Cromwell, no dictator, the constitution forever!" In the midst of the uproar Napoleon entered with four grenadiers. He attempted to address the assembly, which, furious at the outrage inflicted upon it by his presence, interrupted him with cries and clamors. "No soldiers in the sanctuary of the law!" they shouted, and crowded about

the general. He essayed to speak, but being more used to the command of an army than to that of a deliberative assembly, he stammered and hesitated, and could only get out a few broken sentences. At last, a voice from the military outside said, "Let us save our general," and a body of troops rushed in and tore Napoleon by main force from the crowd. No damage appears to have been done in this mêlée beyond tearing the coat of one of the grenadiers. A motion was then made to outlaw Bonaparte; Lucien refused to put it, and then left the chair. At that crisis a body of grenadiers, despatched by Napoleon, entered the hall and carried Lucien off. As soon as he reached the military outside, already somewhat exasperated by the treatment which Napoleon had received, he exclaimed that factious men, armed with daggers, and in the pay of England, had set the deliberations of the representatives of the people at defiance; and that he, as president of the assembly, requested the military to quell the disturbers. The army hesitated, when Lucien swore that he "would stab his own brother if ever he attempted anything against the liberty of the nation." Murat, at the head of a body of grenadiers, entered the hall and ordered the deputies to disperse. They replied with vociferations and curses, and shouts of "The republic forever!" The drums were then ordered to beat, the soldiers levelled their muskets, and the council escaped by the windows, as it could. Meantime Napoleon repaired to Paris, circulated reports of his having been attacked with daggers, procured a person named Thomé to assert that he had himself received the wounds intended for Napoleon, and in other ways won upon the feelings and affections of the troops. Sure of their support, he was already master of the situation. The council of 500 was dissolved by a vote of some 50 members, who also, in connection with the ancients, passed a decree making Sieyès, Napoleon, and Ducos provisional consuls, invested with supreme executive power. "Thus was consummated," says Mignet, "the final blow against liberty, and from that day brute force commenced its dominion." Others, however, look upon this *coup d'état* as a necessary termination to a reign of anarchy and confusion, although none seek to disguise the fact that it was an act of violence, in which the entire civil polity of a nation was subverted in order to make way for the supremacy of a single man.—(See Bourrienne, *Mémoires de Napoléon*; Thiers, *Histoire de la révolution Française*; Mignet, *Histoire de la révolution Française*; "Annual Register" for 1799; M. de Barante, *Histoire du directoire de la république Française*, 2 vols., Paris, 1855.)

BRUMATH, or BRUMPT, a French town, in the department of Bas-Rhin, on the river Zorn, within a short distance of Strasbourg, celebrated for a number of tumuli in which have been found pieces of wood, a hatchet, a knife, a ring, and some other objects, all of Cel-

the origin, supposed to be the remains of a Celtic cemetery. The society for the preservation of historical monuments of Alaska named one of the largest of the tundras to be explored in 1897.

BRUMMELL, GEORGE BRYAN, commonly called Beau Brummell, born in London, in June, 1778, died at Caen, in France, March 29, 1840. His grandfather, a confectioner in Bury street, St. James's, London, let lodgings and had his rooms occupied for some time by Mr. Jenkinson, afterward the earl of Liverpool, who first made use of his landlord's son as an amanuensis, and finally got him a clerkship in the treasury, which, with 2 other offices conferred on him soon after, gave him an income of £2,500 a year. Soon after the 2d William Pitt became prime minister, the 2d Brummell retired to the country on a competency, with the addition of a pension, and, at his death in 1794, left 2 sons and a daughter, with £60,000 among them. George, the 3d son, was educated at Eton, which he entered at the age of 12, and there acquired distinction, not by ability, scholarship, nor industry, but by peculiar taste in dress. Even then, a mere urchin, he acquired the sobriquet of "Beau Brummell," which was continued to him, not only at Oxford, where he went in 1792, but through his brilliant career in London and during his exile in France. From Eton, he brought the knack of writing Latin verses; contested the Nawardiana prize in the university, actually producing the 2d best poem; and was generally believed to be author of the cutting squibs and the practical jokes which were perpetrated in his time. Immediately after his father's death, and at the early age of 16, the prince of Wales, having met him accidentally, took a fancy to him, presented him with a cornetcy in his own regiment (the 10th Hussars), made him his constant companion, and introduced him into the most fashionable society in England. He was an indifferent officer, careless, inattentive, and did not always know his own troop. But, by the favor of the prince, his promotion was rapid. Two years after he entered the service, he was captain. The command of a troop seemed likely to impose trouble on this juvenile captain (scarcely out of his teens), and he threw up his commission, and sold out. Various reasons were assigned, but the probability is to be found in his love of idleness. The death of his father had given him over £30,000, which most men would have considered and employed as a competency. Not so Brummell. He set up a splendid bachelor's establishment in the West End, gave exquisite dinners, at which the prince and the prince's friends "assisted," and before he was of age was a recognized leader of *haut ton*. His chief expenditure was for his house and for dress. He kept only a pair of horses, economically relying on his companions to supply his wants in that respect. As his fortune, though large, was less than his wants, he had to improve it by play or marriage, and hid himself out for

the latter. His appearance was more than passable. His manners, though reserved and often impetuous, could be pleasing and graceful. He made tolerable verses, could draw caricatures, had some musical taste and skill, dressed admirably, and, above all, without stint at the credit of being a professed conversationalist, had a dexterity and readiness of language which, though neither wit nor humor, was accepted as something better than either. In his dress, the greatest study was used and he exaggerate, *Stylos munditie* might have been his motto. He employed the best tradesmen, and his patronage, for many years, gave them numerous customers. Brummell's supremacy was disputed for a time by the prince of Wales, on whose wardrobe over £100,000 was expended, until the increasing corpulence of the royal person rendered competition ludicrous. Less Brummell's reign lasted 21 years, from 1794 to 1815. During this time he associated on equal terms with the highest in the land, royalty included. He was *nonchalant* as well as insolent, assuming a dictatorship to which the noblest and the richest, no matter what the age or sex, appeared happy to submit. A man without education, talent, manners, and money, could not have done this. The three first he undoubtedly possessed, and he had the reputation of still possessing the last, long after the reality had vanished. A man who seriously thought that £200 per annum was not too much for his tailor's bill, and who had no income, would soon see the last of his capital. The wonder is how long Brummell made his last. In dress his taste was excellent, and he deserves credit for being the first to substitute the delicate muslin neckcloth, its too flexible nature softened by a slight starching, for the thick, padded roll which, before his innovation, was invariably swathed around the neck, as a cravat. At last the intimacy with the prince of Wales ceased. Various accounts are given of this rupture. The most popular, but always strongly denied by Brummell, represented him as having familiarly called out in the drawing-room at Carlton house, "Wales! ring the bell," a requisition complied with by the prince, who, when the footman appeared, said, "Call Mr. Brummell's carriage," and so bowed out his quondam friend. Another attributed it to some remark on Mrs. Fitzherbert. The more probable reason may be found in the prince's instability of character. When he was tired of any one, he would cut the acquaintance at once. Beside, as the coolness took place about the time he was made regent, he may have desired to make his circle of associates more select than it had been, when he was simply a man of pleasure. Brummell, however, though his intimacy at Carlton house ceased, still continued the *arbiter elegantiarum* in London. In July, 1813, he was one of 4 who gave a memorable *dîner*. The prince regent, who had intimated his desire to be present, was received by the fashionable *quartette*, and, while he bowed to 3 of the hosts, pass-

ed the 4th by as a total stranger. Brummell, who knew his horror of having his corpulency alluded to, asked, in a most distinct tone, just as the prince passed him, "Alvanley, pray who is your fat friend?" This insolence was dexterous, for it hit the prince on the very spot where he was notoriously thin-skinned. After this, when Brummell's funds began to run low, he became a gambler. Play ran high at the clubs. One night, in 1814, Brummell lost every shilling he had in hand. He raised money at usurious interest, appeared at the opera as usual, and then, entering a friend's carriage, posted off to Dover, and was safe in Calais the next day. His capital was reduced to 25,000 francs, on which, with occasional remittances from his brother in England, he contrived to live for some years. He took his reverses calmly, remarking, in reply to some regrets about his exile at such a place as Calais, "May not a gentleman manage to spend his time pleasantly enough *between London and Paris?*" In 1821, when George IV. passed through Calais, *en route* to Hanover, Brummell made some timid advances, which the king contemptuously disregarded. At last, to place him above actual want, Brummell was appointed English consul at Caen, where he continued for several years, until the office was abolished as unnecessary. Occasional remittances from his family and a few surviving friends in England were seized, to pay a few debts which he had contracted, and at last, reduced to absolute penury, the former associate of royalty and leader of fashion died in a hospital for lunatic mendicants at Caen, at the age of 62. He had spent a quarter of a century in exile, and was only 37 when his reign in London came to a sudden close. Brummell found it very difficult to master the French language, and Byron remarked on the subject that "like Napoleon's progress in Russia, Brummell's progress in French was stopped by the elements." An amusing life of Brummell, by Capt. Jesse, was published in 1844, which gives a graphic account of his whole career, and a fair estimate of his character.

BRUN, FRIEDERIKE SOPHIE CHRISTIANE, a German authoress, born near Gotha, June 8, 1765, died in Copenhagen, March 25, 1835. She was a daughter of Balthasar Mønter, a preacher and lyrical poet, and in her 18th year was married to Konstantin Brun, a wealthy Danish functionary. She accompanied her husband first to St. Petersburg, then to Hamburg, where for several months she enjoyed an intimate acquaintance with Klopstock, and then to Copenhagen. In the winter of 1788, in an excessively cold night, she suddenly lost her hearing, and from that time devoted herself, for many years, to travelling and to literary composition. She became acquainted with many of the most eminent literary persons of her day; passed the winter of 1801 at Coppet, with Madame de Staël, after which she again resided for several years in Italy. She finally returned to Copenhagen in 1810, where

her house was a favorite resort for the literary notabilities of that capital. Most of her works are written in German, comprising poems, travels, and essays on art.

BRUNAI, a Malay state of Borneo, extending from the mouth of Batang-Lupar river in long. 108° 38' E. along the N. W. coast to the bay of Sandakan, adjoining the territories of the sultan of Sooloo. Its inland boundary is a mountain range, at an average distance of 90 miles from the coast, called the Madei and Anga-Anga range, forming an unbroken chain from the head waters of Batang-Lupar to Lake Kuni-Balu, which is in the same latitude with the bay of Sandakan. The coast line is about 900 miles; area, 28,000 sq. m. The state comprises also several extensive islands, Banguay, Balabac, Malawali, Mantanani, Mangkalaan, and numerous islets, with about $\frac{1}{3}$ of the large island of Palawan. Probable pop. of the Bornean portion, 300,000; of the islands, 40,000. The territory of Brunai is mostly covered with a dense tropical forest, accessible only to the Dyaks and orang-outangs; and there has been no communication with the interior, by Europeans or civilized Asiatics, except along its water courses. These are numerous; the mouths of not less than 21 can be counted, which disembogue into the China sea, between Cape Sampanmanjo and Cape Datoo, all of which are navigable far inland for vessels of light draught of water, and 2, the Rajang and Brunai, for vessels of the largest class. Extensive fields of valuable fossil coal have been discovered on many of these streams, and European companies have commenced their development. The chief exports of native production are pepper, ratans, sago, camphor, birds' nests, bezoar stones, vegetable tallow, ebony, pearl shells, and tortoise shell. Europeans are engaged in the mining and export of coal and antimony, the latter being found in this territory more abundantly than in any other part of the world. The principal imports are European and Bugis manufactured cloths, either plain blue or small checks, brass wire, fire-arms, coarse crockery, unwrought iron in small bars, Chinese urns, iron caldrons, and tobacco. Salt is an important item of import, as on account of the low, alluvial character of the whole coast of Borneo, none is manufactured in the island. The sale of it in this territory is a monopoly of the Malay sultan, as it is of the Dutch government wherever established. There is no money in use, either among Malays or Dyaks; even in the shape of coin it has not yet been employed. The chief standards of value, in the intercourse between the Malays of the coast and the rude Dyaks of the interior, are small bundles of iron rod, of the weight of a Chinese cattie, or $1\frac{1}{4}$ lb., and pieces of Bugis manufactured checks. Among the Dyaks themselves, smoked human heads constitute the principal medium of exchange. Of the population of this territory, not more than $\frac{1}{4}$ are Malays, the ruling race. The most of them claim to be descendants of

conquerors, or emigrants from Menangkabou in Sumatra; while a portion are colonists of piratical Lanoes from Mindanao and the Sooloo Islands, and some Hajang, or Malay sea gypsies. The government is an absolute despotism; and the present sultan, Omer Saïfuddin, is claimed to be the 60th in direct line from the first Sumatran conqueror. The aborigines are the Dyaks, the same race found throughout Borneo; and of these there are 60 different tribes in this territory, each one of which speaks a language unintelligible to the others. The Kayans, a tribe of Dyaks found between the Itajang and Baram rivers, cultivate corn and cotton, and employ the buffalo in their agriculture; and Kayan artisans fabricate the best sword and kresse blades in the archipelago. Their mandoes and other cutting weapons are famous throughout the East, and are known in Europe. The Serubas, Sakarran, and Kanowit tribes, who inhabit the territory adjacent to rivers of the same name, are noted for their piratical and head-hunting propensities, and figure prominently in the history of Raleigh Brooke, who on one occasion, with the aid of British ships-of-war, slaughtered about 2,000 of these tribes. The coal of Labuan and of the mainland of Brunai is of excellent quality for steamship uses, being considered equal to the best Wigan or cannel coal. It is mined at a cost of 5s. sterling, or about \$1 2s. per ton; and delivered to the government at the pit's mouth for 11s. or \$2 5s. per ton. A royalty of 2s. 6d. per ton is paid by the mining contractors.—The sultan of Brunai made a treaty with the United States in 1839, through our consul at Singapore, Mr. Balesier, which secures to Americans an unrestricted residence, and permission to acquire and hold property in Brunai territory; and provides that, except a charge of \$1 per registered ton on American vessels, no other impost shall be levied on their trade; that there shall be no export duties; and that American citizens committing offences, shall be under the jurisdiction of the American consul. Congress has established a consulate at the port of Brunai; but the office has not yet been filled, as no salary was attached to it.—The town of Brunai, and capital of the territory, is situated on the river of the same name, about 14 miles from its mouth, in lat. 4° 55' N., long. 114° 55' E. It is an equal city, like Palembang and Acheen in Sumatra; the most of its bamboo houses being aloft, and moored to the banks of the river, or of the canals communicating with it, by strong cables of oak, and gangways of split bamboos. All communication between different parts of the town is by boat. The state processions are in ornamented prahus or barges; the amusements are on the water; infants swim in it before they can walk; the marketing is transacted in fleets of sampans or small boats, that move from one canal to another. Pigafetta gives an interesting account of his visit to Brunai in 1521, and of the reception by the sultan of the Spanish officers of Magellan's expedition. This state

was evidently of much greater consequence at that period than now. He says that the town contained 20,000 houses. Its present population is only about 15,000.

BRUNCK, HENRICH FRANTZ PHILIPP, a German philologist and critic, born at Strassburg, Dec. 30, 1729, died June 12, 1808. He was educated in the colleges of the Jesuits at Paris, served in Hanover as commissary of war, became acquainted at Göttingen with a learned professor, who inspired him with an admiration of the Greek literature; returned at the age of 90 years to Strassburg, where he studied in the university till he had mastered the Greek language. As an editor he made no commentaries, but occupied himself only with the text. Permeated that all faults in the language of the Greek poets came from the carelessness of copyists, he corrected the texts with the utmost fearlessness, changing, omitting, interpolating, and transposing with an audacity often happy in respect of taste and sentiment, but censurable in point of criticism. Yet he rendered great service to Greek learning from his accomplished scholarship, and from the circumstance that he held a lucrative official position which enabled him to issue his editions without depending on a publisher. He edited the Greek anthology, all of the tragedies of Sophocles, and several of those of Æschylus and Euripides, the Greek gnomic poets, and the works of Anacrusis, Aristophanes, and Apollonius of Rhodes. His labors were interrupted by the French revolution, whose principles he embraced with ardor. He was imprisoned during the reign of terror, was twice ruined in property, and obliged with tearful eyes to part with his books. From this time Greek letters became odious to him; he transferred his love to Latin authors, and edited Virgil, Plautus, and Terence.

BRUNDUSIUM. See BRINDISI.

BRUNE, GUILLAUME MARIE ANNE, a marshal of the French empire, born at Brives-la-Gaillarde, March 13, 1763, died in Avignon, Aug. 2, 1815. His father sent him to Paris to study the law, but on leaving the university, financial difficulties caused him to become a printer. In the beginning of the revolution, together with Gauthier and Jourgniac de St. Méral, he published the *Journal général de la cour et de la ville*. He soon embraced the party of the revolution, enlisted in the national guard, and became an ardent member of the club of the *cordeliers*. His grand figure, martial air, and boisterous patriotism, rendered him one of the military leaders of the people in the demonstration of 1791 in the Champ de Mars, which was crushed by Lafayette's national guards. Thrown into prison, and the rumor spreading that the partisans of the court had attempted to get rid of him by various means, Danton was instrumental in procuring his release. To the protection of the latter, among whose partisans he became prominent, he owed a military appointment during the famous

days of Sept. 1792, and his sudden promotion, in Oct. 12, 1792, to the rank of colonel and adjutant-major. He served under Dumouriez in Belgium; was sent against the federalists of Calvados, advancing under Gen. Puisaye upon Paris, whom he easily defeated. He was next made a general of brigade, and participated in the battle of Hondschoote. The committee of public safety intrusted him with the mission of putting down the insurrectionary movements in the Gironde, which he did with the utmost rigor. After Danton's imprisonment, he was expected to rush to the rescue of his friend and protector, but keeping prudently aloof during the first moments of danger, he contrived to shift through the reign of terror. After the 9th Thermidor he again joined the now victorious Dantonists, and followed Fréron to Marseilles and Avignon. On the 18th Vendémiaire (Oct. 5, 1795) he acted as one of Bonaparte's under-generals against the revolted sections of Paris. After having assisted the directory in putting down the conspiracy of the camp at Grenoble (Sept. 9, 1796), he entered the Italian army in the division of Massena, and distinguished himself during the whole campaign by great intrepidity. Wishing to propitiate the chiefs of the *cordeliers*, Bonaparte attributed part of his success at Rivoli to the exertions of Brune, appointed him general of division on the battlefield, and induced the directory to instal him as commander of the second division of the Italian army, made vacant by Angereau's departure for Paris. After the peace of Campo Formio he was employed by the directory on the mission of first lulling the Swiss into security, then dividing their councils, and finally, when an army had been concentrated for that purpose, falling upon the canton of Bern, and seizing its public treasury; on which occasion Brune forgot to draw up an inventory of the plunder. Again, by dint of manœuvres, bearing a diplomatic rather than a military character, he forced Charles Emmanuel, the king of Sardinia, and the apparent ally of France, to deliver into his hands the citadel of Turin (July 3, 1798). The Batavian campaign, which lasted about 2 months, forms the great event of Brune's military life. In this campaign he defeated the combined English and Russian forces, under the command of the duke of York, who capitulated to him, promising to restore all the French prisoners taken by the English from the commencement of the anti-Jacobinic war. After the *coup d'état* of the 18th Brumaire, Bonaparte appointed Brune a member of the newly created council of state, and then despatched him against the royalists of Brittany. Sent in 1800 to the army of Italy, Brune occupied 3 hostile camps, intrenched on the Volta, drove the enemy beyond this river, and took measures for crossing it instantly. According to his orders, the army was to effect its passage at 2 points, the right wing under Gen. Dupont between a mill situated on the Volta and the village of Pozzolo, the left wing under Brune himself at

Monbazon. The second part of the operations meeting with difficulties, Brune gave orders to delay its execution for 24 hours, although the right wing, which had commenced crossing on the other point, was already engaged with far superior Austrian forces. It was only due to Gen. Dupont's exertions that the right wing was not destroyed or captured, and thus the success of the whole campaign imperilled. This blunder led to his recall to Paris. From 1802 to 1804 he cut a sorry figure as ambassador at Constantinople, where his diplomatic talents were not, as in Switzerland and Piedmont, backed by bayonets. On his return to Paris, in Dec. 1804, Napoleon created him marshal in preference to generals like Lecourbe. Having for a while commanded the camp at Boulogne, he was, in 1807, sent to Hamburg as governor of the Hanseatic towns, and as commander of the reserve of the grand army. In this quality he vigorously seconded Bourrienne in his speculations. In order to settle some contested points of a truce concluded with Sweden at Schlachtow, he had a long personal interview with King Gustavus, who, in fact, proposed to him to betray his master. The manner in which he declined this offer raised the suspicions of Napoleon, who became highly incensed when Brune, drawing up a convention relating to the surrender of the island of Rügen to the French, mentioned simply the French and the Swedish armies as parties to the agreement, without any allusion to his "imperial and royal majesty." Brune was instantly recalled by a letter of Berthier, in which the latter, on the express order of Napoleon, stated "that such a scandal had never occurred since the days of Pharamond." On his return to France, he retired into private life. In 1814 he gave his adhesion to the acts of the senate, and received the cross of St. Louis from Louis XVIII. During the Hundred Days he became again a Bonapartist, and received the command of a corps of observation on the Var, where he displayed against the royalists the brutal vigor of his Jacobin epoch. After the battle of Waterloo he proclaimed the king. Starting from Toulon for Paris, he arrived at Avignon, on Aug. 2, at a moment when that town had for 15 days been doomed to carnage and incendiary fires by the royalist mob. Being recognized by them, he was shot, the mob seizing his corpse, dragging it through the streets, and throwing it into the Rhone. "Brune, Massena, Angereau, and many others," said Napoleon at St. Helena, "were intrepid depredators." In regard to his military talents he remarks: "Brune was not without a certain merit, but, on the whole, he was a *général de tribuns* rather than a terrible warrior." A monument was erected to him in his native town in 1841.

BRUNEHAUT, or BRUNEHILDE, a famous queen of Austrasia, the eastern kingdom of the Franks, born in 584, killed in 614. The daughter of Athanagild, the Visigoth king of Spain, she married in 563 Siegbert, king of

Anstrasia, and signed Arrianism. This marriage was celebrated by Fortunatus, bishop of Poitiers, in a poem still extant. Chilperic, king of Neustria, and brother of Sigbert, also allied himself with the most powerful family in Spain by marrying Galsuinda, the youngest of the daughters of Athanagild. Instigated, however, by his mistress, Fredegonda, whom he afterward made his queen, he soon abandoned and murdered Galsuinda. Brunehaut, eager to avenge her sister, impelled her husband to attack the kingdom of Chilperic, who was obliged to retreat for safety into Tournay. She was expecting to wreak a fearful vengeance upon Chilperic and Fredegonda, when Sigbert was slain in the camp by assassins sent by the queen of Neustria. The Austrasian army was immediately dispersed, and Brunehaut fell into the power of Chilperic, and was conveyed a prisoner to Rouen. There she induced Meroveus, one of the sons of the Neustrian king, to marry her, and favored by Proterstas, the bishop of Rouen, effected, after a time, her escape to Anstrasia, then governed by her son Childobert. At first repelled by the Austrasian nobles, who in the vicinity of the German forests had preserved their rude and independent habits, she yet succeeded in recovering her authority, and obtained ascendancy over the young king. She was, however, obliged to guard against the snares of Fredegonda, who had already slain Proterstas and Meroveus. In 587 she concluded with Gontran the treaty of Andelot, which fixed the limits between Anstrasia and Burgundy. After the death of Childobert in 595, the nobles prevented her from ruling in the name of her grandson, Theodebert II.; but another of her grandsons, Thierry II., received her in Burgundy, and made her mistress of his affairs. She quickly kindled a war between the 2 brothers. Theodebert, vanquished at Tol and at Talbise, was slain with his family in 612. Thierry was poisoned mysteriously soon after, and Brunehaut in her old age seemed about to ascend the throne again, when she was opposed by Clothaire II., son of Fredegonda, at the head of an army of Burgundians and Austrasians. She encountered the enemy on the banks of the Aisne, but her troops, secretly betrayed before the battle, refused to fight, and Brunehaut fell into the hands of the son of Fredegonda. The latter reproached her with having caused the death of 10 kings, or sons of kings, exposed her for 8 days to torture and to the insults of the soldiers, and then bound her by a foot and an arm to the tail of a wild horse. Her limbs were collected and buried, and the ashes scattered to the winds. "Thus perished," says Hemond, "one of the most powerful queens who has ever maintained a dominion on the earth; who, though often experiencing adverse fortune, always rose above it by her firm character, indomitable courage, rare talents, and unsurpassed skill in governing men." She has been most diversely judged by historians,

being charged by some with monstrous crimes, and lauded by others with romantic virtues. Her contemporaries usually speak of her with favor. Fortunatus praises her grace and beauty; Gregory of Tours mentions her as a model of virtue, wisdom, and gentleness; and Pope Gregory the Great styles her a pious queen and a Christian mother. She was fond of architecture, and lavished immense treasures upon structures of imposing grandeur. The history of the rivalries of Brunehild and Crimihild, in the Scandinavian mythology, and in the chronicles of the Nibelungen, has been thought to redouble the long quarrel between the queens of Anstrasia and Neustria. A tragedy under the title and on the subject of Brunehild was published by Emanuel Geibel, in 1850.

BRUNEL, SIR MARK ISAMBARD, a renowned civil engineer, born at Haqueville, near Rouen, April, 25, 1769, died Dec. 12, 1849. He was the son of a farmer, was educated at Rouen, studied drawing and hydrography, and in 1786 entered the merchant service, and made several voyages to the West Indies. On board ship he constructed nautical instruments, and it is said, a planisphere. In 1788, for political reasons, he fled from France to New York, where he undertook the exploration and survey of some lands for a French land company, and in 1794 commenced the survey of the Champlain canal. He sent in a design for the house of congress, and was much employed as an engineer and architect in New York, both by the state and by private individuals. After a stay of a few years in America, he returned to Europe, and visited England. His maritime pursuits gave a direction to his engineering genius, and he invented machinery for cutting the blocks used in the rigging of ships, which effected a vast saving both of time and money. The value of this was appreciated by government, and its use for the royal dockyards was secured by a large premium to the inventor. He produced numerous other admirable machines, among others a toy for shuffling and packing cards, as a professional compliment to Countess Spencer. His great work was the Thames tunnel, about 2 miles below London bridge. The difficulties were immense. The stratum between the bed of the river and the London blue clay suitable for engineering operations was so narrow, that in some places only 6 feet was left between the river and the crown of the arch. Consequently, the river broke in frequently and deluged the works. The tunnel was opened in 1843, and must be regarded as an engineering triumph, although as a commercial speculation it is a failure. In his profession he was distinguished by untiring perseverance and inexhaustible fertility of invention. In private life he was universally respected.—ISAMBARD KNOX, son of the preceding, born 1806, at Portsmouth. He was educated at the college of Henry IV. at Caen in Normandy, and was resident engineer of the Thames tunnel under his father. Here he had several narrow escapes

of his life from the breaking in of the water. He was long occupied on an engine driven by carbonic acid gas, designed by his father, the use of which as a motive power was abandoned from economical motives, although the machinery was brought to high perfection. At the commencement of the railway system of England, Mr. Brunel threw himself with ardor into the movement. He planned the Great Western, the noblest and most massively constructed line in the world. He designed the broad gauge, on which the highest locomotive speed hitherto known is attainable, which cannot, however, be said to answer in an economical point of view. We believe that he is the inventor of the skew bridge, by which the inconvenience in railway engineering of constructing bridges at right angles with a water or roadway is avoided. Beside being engineer-in-chief to the Great Western railway, and its numerous connecting lines, he was the constructor of the Great Western steamship, the first which regularly traversed the Atlantic, and which traded for many years between Bristol and New York, afterward of the Great Britain screw steamship, and lately of that prodigious result of skill and ingenuity, the Leviathan. Mr. Brunel took part in the floating and raising of the Conway and Britannia tubular bridges, constructed some of the most important docks on the English coast, conducted the works of the Tuscan portion of the Sardinian railway, and of other foreign railways, and during the war with Russia he had the entire charge of establishing and organizing the Renkioi hospitals on the Dardanelles. The Box tunnel on the Great Western railway, near Bath, is a fit pendant to his father's Thames tunnel. The Hungerford suspension bridge on the Thames, at London, the largest span in England, is a model of lightness and elegance. As may be inferred from his professional achievements, his activity and industry are absolutely indefatigable, while his enthusiasm and self-confidence are unbounded. On the latter point it is related that when the controversy between engineers on the respective merits of the broad and narrow gauges was at its height, Mr. Brunel offered to drive one of his own ordinary broad gauge locomotives, with a common load, at 100 miles an hour, if any narrow gauge engineer would accept the challenge. None was found daring enough to take it up. The history of this gauge controversy is fully detailed in Mr. Smiles's "Life of George Stephenson." Mr. Brunel is vice-president of the institution of civil engineers and of the society of art, fellow and member of the council of the royal society, and member of many other learned societies.

BRUNELLESCHI, FILIPPO DI SER LAPPI, an Italian architect, born in Florence in 1377, died there in 1444. He first studied painting and sculpture, and brought the art of perspective to perfection; but as an architect he gained most distinction, having, according to his countrymen, revived the Doric, Ionic, and Corinthian

orders. His great works are the cupola of the church of Santa Maria del Fiore at Florence, the celebrated Pitti Palace at Florence, and the abbey at Fiesole.

BRUNET, JACQUES CHARLES, a French bibliographer, born in Paris, Nov. 2, 1780. The son of a bookseller, he early acquainted himself with rare editions and copies of books, and made several catalogues of old libraries. His most important work is a *Manuel du Libraire et de l'amateur de livres*, which appeared in 1810, and to which a supplement of new bibliographical researches was added in 1834. A 4th edition in 5 vols. appeared in 1842-'44, and a 5th edition has been announced for 1858. The completeness of this work makes it of value to the bibliographers of all countries. In 1852 he published researches upon the original editions of Rabelais.

BRUNETTI, ANGELO, a leader of the Roman democracy in 1848 and 1849, more generally known in Rome under the name of Ciceruacchio. A carman by trade, he obtained much influence over the Roman populace, which during the time of the reformatory aspirations of Pius IX. he exerted in the pope's favor, but subsequently in favor of Mazzini, whose cause was to a great extent indebted to Brunetti for its success. After the occupation of Rome by the French, Brunetti removed to Genoa, and subsequently to France. His execution, by Austrian soldiers, was reported in 1856. According to another report he has been seen at a later period, at Kertch, in the Crimea, carrying on a successful trade as a sutler.

BRÜNN (Slavic, *Brno*, a ford), a circle in Moravia; pop. 869,300. The capital, of the same name, pop. 45,000, is situated on a declivity at the confluence of the Schwarza and the Zwittawa, and is connected by railway with Vienna and Prague. The streets are generally narrow and crooked, but are well paved and lighted, and relieved by large open squares, in several of which are fountains. Fortifications separate the city from a number of suburbs. It was formerly defended by the castle of Spielberg, which stands on a high hill just back of the town. This castle was converted into a state prison, and was the place of confinement of Silvio Pellico, and of other political offenders. The last remnants of its fortifications were destroyed by the French in 1809. The city contains many fine buildings, some of the most notable of which are the cathedral, the church of St. James, built between 1814 and 1480, the *Landhaus*, formerly a rich Augustinian convent, the barracks, once a Jesuit college, the city hall, and the palaces of Prince Dietrichstein and Prince Kaunitz. A public park, the Augarten, was opened by Joseph II., and in the public gardens of the Franzenburg quarter is a monument to the emperor Francis I. The Zderad monument—one of the most ancient of Moravia—stands outside of the town. Brünn is a bishop's see, and the seat of the principal law and military courts for

Moravia and Austrian Silesia. A Protestant Sunday school is also held here. It has a great number of educational, historical, charitable, and scientific institutions, a valuable museum, botanical garden, public library, and provincial bank. It is an ancient place, full of historical associations. The citadel was blockaded by the Hungarians in 1847; the town itself was besieged by the Swedes in 1645, and by the Prussians in 1742. It has repeatedly been destroyed by fire, and in 1556 the plague carried off 4,000 of the inhabitants, to whose memory a column has been raised in the great square. Napoleon had his headquarters here before the battle of Austerlitz, Dec. 1805. A monument in commemoration of the battle of Leipzig has been erected on a neighboring hill called the Franzensberg. Bruhn owes its prosperity chiefly to its manufactures and to its facilities for trade, by means of railway communication with Vienna, Prague, Breslau, and Posen. Its woollen manufactures are the most extensive in the Austrian dominions. Leather, cotton goods, silk, glass, soap, machinery, &c., are also produced in great quantities.

BRUNNEN, a village of the Swiss canton Schwytz, near the mouth of the Mucitta, on the lake of Lucerne. It is memorable as the spot where the deputies of the cantons of Schwytz, Uri, and Unterwalden laid the basis of the Helvetic republic, Dec. 8, 1315.

BRUNNOW, Enzar Geena vox, a German novelist and champion of homoeopathy, born in Dresden, April 6, 1796, died there, May 4, 1845. In 1818, while at the university of Leipzig, he suffered from a disease of the eyes, which was cured by Helmsmann's homoeopathic treatment, and henceforth devoted himself to the dissemination of the principles of homoeopathy. He took a prominent part in the foundation of a homoeopathic association in Germany, and translated Hahnemann's *Orygama der Heilkunde* into French, and, in conjunction with Stapf and Gross, his *Reine Arzneimittellehre* into Latin. In 1844, he wrote a book called "A Glance at Hahnemann and at Homoeopathy," and he is also the author of some lyrical poems and novels, of which his *Ulrich von Hutten* and his *Troubadour* derive some importance from their historical character. — PRITZKE, baron, a Russian diplomatist, brother of the preceding, born in Dresden, Aug. 31, 1797, studied at the university of Leipzig. He entered the Russian service in 1815, and was employed for some time in the office of the governor-general of Bessarabia. Subsequently Count Orloff availed himself of his services in drawing up the treaty of Adrianople, and in other negotiations. He was afterward nominated imperial councillor, attached to the office of Count Nesselrode, and appointed ambassador at Stuttgart and Darmstadt in 1832. In the course of the same year, he was sent on a special mission to London, and, after a brief visit to Germany, accredited there as ambassador in July, 1840, taking part during the following 15 years in many important negotiations.

Leaving England Feb. 8, 1854, on occasion of the outbreak of the war with Russia, he was appointed ambassador at the Congress diet in Oct. 1855, attended in the following year the peace conference of Paris, as 3d representative of Russia, and was nominated ambassador at Berlin, Feb. 10, 1857, where he remained until the beginning of 1858, when he was again selected as ambassador in London.

BRUNO THE GREAT, archbishop of Cologne and duke of Lotharing, son of Henry I, emperor of Germany, born in 925, died at Helms, Oct. 11, 905. He was distinguished for learning and charity. There are attributed to him commentaries on the Gospels and the Pentateuch, and several lives of saints.

BRUNO, SARDY. I. The apostle to the Prussians, born of a noble Saxon family at Querfurt in 970, succeeded St. Adalbert in his missionary labors, converted the emperor Henry II, and became his chaplain, and was assassinated in 1008 by the pagans of Lithuania. II. The founder of the order of Carthusians, born about 1030 of a noble family at Cologne, died in 1101. Refusing the metropolitan see of Liege, he frequented the world for the practice of asceticism in the mountain wilds between France and Italy. The order which he founded derives its name from his abode near Grenoble, where he established the rules of a severe monastery. He was invited to Rome in 1089 by Pope Urban II, who had formerly been his disciple, refused the ecclesiastical dignities which were offered him, died in a monastery which he had founded in Calabria, and was canonized in 1514.

BRUNO, GIOVANNI, an Italian pantheistical philosopher, born about the middle of the 16th century, at Nola, near Naples, burnt at the stake in Rome, Feb. 17, 1600. Of the earlier events of his life scarcely any thing is known, except that he was a zealous student of Greek and Roman literature, of philosophy, mathematics, and astronomy. He was one of the first to embrace the astronomical theories of Copernicus, which had been spread before the world in 1543. Having entered the order of the Dominicans, his liberal opinions on religious subjects, and his bold attacks on monastic institutions, made him an object of hatred and denunciation. He fled from Italy to Geneva in 1580, but the hostility of the Calvinists there was such that he found himself in a worse condition than before, and once more became a wanderer. After a short stay at Lyons and Toulouse, he went to Paris, where he obtained a certain celebrity by writing a comedy entitled *Il cardinale*, and also by several treatises on the *Arta Magna* of Raymond Lully. In 1585 he went to London, where he gained the friendship of Sir Philip Sidney, and other eminent persons, with whom he had frequent meetings, to which only congenial spirits were admitted. After a residence there of 2 years, he returned to Paris, and in public lectures violently attacked the philosophy of Aristotle, showing an independence of thought

which alone would have made him a heretic; for in those times Aristotle's philosophy had almost the sanctity of religion, notwithstanding the courageous attempts of the spirited Peter Ramus to overturn it. Bruno defended his opinions in public discussions with Hennequin and others, but at last, when he had set up a complete pantheistical system in his writings, Paris became a dangerous place for him, and in 1586 he went to Germany. After a brief stay at Marburg, he settled at the university of Wittenberg as a lecturer on philosophy and mathematics. But his restlessness did not allow him to remain there more than 2 years. In his valedictory address he paid the highest tribute to the genius of Luther, but he declined the pressing invitations which he received to join the Lutheran church as persistently as he had those of the Calvinists at Geneva. For 4 years he went from one German university to another, lecturing now at Prague, then at Helmstädt, then again at Frankfurt, until, in 1592, contrary to the urgent advice of his friends and well-wishers, he ventured to return to Italy. There he remained for 6 years, living in Padua, unmolested by the ecclesiastical authorities, and devoting his time to philosophical researches and literary pursuits. At last, in 1598, when on a visit to Venice, he was arrested by the inquisition, sent to Rome, and kept in a dungeon for 2 years, in the hope that his physical sufferings would make him recant his doctrines. But in this his opponents were mistaken. He would not falsify his opinions even to save his life. Accordingly, he was publicly burned at the stake as a heretic, an infidel, and a breaker of his vows. He died as he had lived. Even when the flames had enveloped him, and life had become almost extinct, he turned his face away in disgust from a zealous monk who held out to him a crucifix.—Bruno was a man of great mental activity, facility and breadth of perception, boldness of thought, and of a vivid imagination, aided by extraordinary power and brilliancy of expression, both in speaking and writing. As a philosopher, his place is upon the dividing line between those devotees of scholasticism and classicism—who, during the first half of the 16th century, cultivated a kind of philosophical speculation, which bore the same relation to true philosophy that alchemy sustains to chemistry,—and the really original thinkers and creators of modern philosophy who appeared in the course of the 17th century. Guided in his earliest reasonings by the Eleatic philosophers, he drew from them his first crude conceptions of the identity of God and the universe. But these ideas were strangely and fancifully blended not only with the mental ecstasies of the Christian mystics, but also with the first vague and imperfect revelations of modern astronomy, with some coarse fragments of astrology, and even with some of the abstruse cabalistic and metaphysical ciphering of Raymond Lully. Thus his philosophy appears as a remarkable compound of strange ingredients,

held together more by the force of intuition than by argument or logic. Still, such as it is, it has proved very captivating, and not without influence on the development of modern thought. Montaigne excepted, there is no philosopher of the 16th century who has been so frequently a subject of research and comment by modern scholars as Giordano Bruno. Descartes has borrowed largely from him, and Spinoza's system would appear almost like Bruno's, refined in the logical crucible of Descartes. Nay, even with some philosophers of the 19th century Bruno has been a favorite. One of the profoundest works of Schelling bears the name of Bruno on its title ("Bruno, or the Divine and the Natural Principle of Things"), and this once more directed the general attention of scholars to Bruno's works, which had become extremely rare. They have been republished since then, those written in Italian by Wagner (*Opere di Giordano Bruno*, 2 vols., Leipzig, 1880), those written in Latin (*Jordani Bruni Nolani scripta qua latina rededit omnia*), by Gfrörer, in his *Corpus Philosophorum* (Stuttgart, 1884). The works of Bruno are numerous and of the most varied character. It has been stated already that he was the author of a comedy which, by the way, was at a much later period considered good enough to be adapted to the French stage. His flashing wit, at least what in those times was honored with that name, and his keen perception of the ridiculous, prompted him to write satires which even now, when the interest in their subjects has entirely passed away, are agreeable reading. Of these, the *Spaccio della Bestia trionfante* ("Expulsion of the Triumphant Beast"), a satire on the immorality of the times, and the *Cabala del cavallo Pegaseo coll'aggiunta del asino Cilenico*, a satirical eulogy on ignorance, were the best. The *Cena delle Ceneri* ("Table-talk on Ash Wednesday") is a spirited dialogue in defence of the Copernican theory. But those of his works in which he has developed his philosophical views in the clearest and most concise form, are the essays, *Della causa, principio, ed uno, Dell' infinito universo, e mondi*, and *De monade, numero, et figura*. In his system there is but one fundamental principle, one substance, whose existence is real and original. This eternal and infinite being produces by contraction or expansion innumerable apparitions whose existence is but secondary, merely a shadow of that of the original being. God and the universe are identical; the universe is infinite. Every being or thing (*ens*) has, beside the innermost principle of its existence, a cause of existence. While the former is the immanent condition, the latter is the immediate source of existence. The original cause is the universal intellect which shapes and moulds matter into individual forms. In the harmonious perfection of the universe, all possible forms would obtain real existence in all portions of matter. Every form being the result of an intellectual action, and matter being conceiv-

sible only under some form or other, it follows that everything is living or has its soul, which is its form. The substance of all existing beings is one and the same. It is only the forms brought forth by the intellectual activity of the original substance which show differences of appearance. The universe, considered as a whole, is a unit, infinite, immovable, the absolute identity of possibility, reality, and action. This grand unit of all substance, of which all beings and things are only secondary manifestations, is God; God is the monad of the monads. Man, as an intermediate being between time and eternity, belongs to both spheres at the same time, the spiritual and the sensual; but his principal aim is the mind and intellect. The human mind is an integral portion of the divine substance; the perception of the supreme truth, the volition of the supreme good, are its goal. Never the narrow sphere of common life, man ought to rise to a higher conception of his relation to the universe, and of the affinity of his spiritual being to the universal intellect. Such is briefly the substance of Bruno's metaphysics and ethics. Beside these, a cosmology forms part of his system. Here his brilliant imagination has been brought largely into use. Some of the strangest theories of old are curiously dovetailed with the modern astronomical systems, the whole embellished with the liveliest colors of poetry. With a vastness of vision not equalled even in the apocryphal *Somnium Scipionis*, he views the whole universe as one immense living being, the different celestial bodies as members driven upon their orbital course by their immanent souls. He also assumes that these bodies consist of the same elements as the earth, and that they are the residences of redeemed souls, while the infinite ether, in which the stars move, is the substratum of the divine substance. Bearing up higher and higher in visions like these, Bruno at last leads upon the common ground of mystics, pantheists, materialists, and the modern speculative philosophers, namely, that all is necessarily just what it is, nor could be any possibility be otherwise; that therefore all that is, is good, and to a good purpose, because emanating from the eternal good.

BRUNSWICK, I. A southern county of Virginia, bordering on North Carolina, watered by the Nottoway, the Roanoke, and the Meherrin rivers, contains an area of 800 sq. m. Its great product is tobacco. It also raises a good deal of Indian corn, some wheat, oats, and sweet potatoes, and 100 or 200 bales of cotton. A large portion of its land is exhausted by the tobacco culture, but has recently been improved by the use of guano. It was organized in 1720. Capital, Lawrenceville. The area was reduced by the erection of Appomattox co. in 1845. Its real estate was assessed in 1850 at \$1,102,640; in 1857, at \$1,553,141, showing an increase of 37 per cent. Pop. in 1850, 18,594, of whom 8,456 were slaves, and 658 free colored. The productions

were 78,267 bushels of wheat, 394,500 of Indian corn, 44,062 of potatoes, 1,166,017 lbs. of tobacco, 20,089 of butter, and 2,282 tons of hay. There were 33 corn and flour mills, 2 saw mills, 5 tanneries, 24 churches, and 126 pupils attending public schools. II. A south-eastern co. of North Carolina, bordering on South Carolina, washed by the Atlantic, drained by Cape Fear and Waccamaw rivers, and comprising an area of about 960 sq. m. The surface is level, and much of it swampy. The soil is poor and sandy, but capable of producing rice and cotton to some extent. The productions in 1850 were 63,223 bushels of corn, 101,017 of sweet potatoes, and 2,667,415 lbs. of rice. Pine timber, tar, and resin are exported in considerable quantities, and the cypress and juniper grow in the swamps. Capital, Smithville; pop. in 1850, 7,272, of whom 2,302 were slaves.

BRUNSWICK, I. A. A flourishing village in Cumberland co., Me., on the right bank of the Androscoggin river, at the head of tidewater; pop. in 1854, about 4,500. Extensive falls furnish abundant water power; there are many saw mills, a flour mill, cotton factory, machine shop, &c. A wooden truss bridge crossing directly over the falls unites it with Topsham, and a larger bridge of similar construction is used by the Kennebec and Portland railroad, which connects Brunswick with Portland, 27 miles distant; with Augusta, 80 miles; and with Bath, 9 miles. Brunswick, under its Indian name, Pejepscott, was granted to its first proprietors in 1684, but had only very few English inhabitants, who lived by salmon fishing at the falls and kindred pursuits, until nearly a century later, when its immense hydraulic power and the abundance of pine timber in the vicinity attracted numerous speculators to settle there. The manufacture of lumber has since then been their chief pursuit, until, of late years, the scarcity of lumber has induced them to turn their attention to shipbuilding. As Brunswick belongs to the Bath collection district, the ships built there are not registered separately. A large amount of the wealth of the place is invested in ships. There are 5 churches, 2 banks, and an excellent school system. The schools are graded, and attended by all the children of the place. It is the seat of Bowdoin college. (See *Bowdoin College*.) II. A port of entry and capital of Glynn co., Ga., pleasantly situated on a bluff of no great height, on Turtle river, 80 miles S. S. W. of Savannah. It has a spacious and secure harbor, with 12 feet of water over the bar at low tide, and a lighthouse on St. Simon's island, 4 miles below. The entrance to St. Simon's sound, through which the Turtle river enters the Atlantic, is about 10 miles W. of the town. The tonnage of the district in 1855 amounted to 1,060. The Brunswick and Florida railroad, not yet finished, has its eastern terminus here.

BRUNSWICK (Ger. *Braunschweig*), a duchy in the N. W. of Germany. Its area and pop. (1857) are as follows:

	Area, sq. m.	Pop.
1. Brunswick.....	294	66,614
2. Wolfenbüttel.....	230	53,486
3. Helmstädt.....	805	44,687
4. Gandersheim.....	816	42,101
5. Holzminden.....	276	28,586
6. Blankenburg.....	178	22,479
	1,524	269,213

About 240,000 of the inhabitants are Protestants. The general character of the surface is hilly, and in the mountainous districts the climate is severe and the harvests late. About $\frac{1}{3}$ of the land is arable, $\frac{1}{3}$ thickly wooded, and much of the rest moorland. The largest rivers are the Ocker, Leine, and Weser, the last of which drains the greater part of the duchy and has many affluents. Brunswick may be divided into the mining districts, which lie chiefly among the Hartz mountains, and the agricultural regions, which comprise nearly all the rest of the country. Grain, fruit, tobacco, flax, cattle, and horses are raised in the latter, while the former are rich in gold, silver, copper, lead, iron, sulphur, and coal. The mines, in some of which Hanover has a joint interest, are not now so productive as in former times, but are still of high value. Other minerals, such as marble, alabaster, limestone, gypsum, potters' clay, asbestos, asphaltum, jasper, and agate, are found in various localities. Salt is obtained in abundance. The manufactures are inconsiderable. The making of linen once employed a number of hands, but is now declining. Spinning is a favorite occupation throughout the duchy, and there are several camlet manufactories, dye-houses, paper, oil, and saw mills, breweries, iron works, and manufactories of lacquered wares and porcelain. The advantages of railway communication with Hanover, Magdeburg, and Neustadt, have given to trade a magnitude scarcely to be expected from the geographical position of the country. The university of Helmstädt was suppressed in 1809, but there are 2 seminaries, 5 gymnasia, 2 normal, 21 Latin, and 869 common schools, and a library at Wolfenbüttel, of considerable repute.—The form of government is a limited hereditary monarchy, the supreme power being vested in the duke and a legislative body of 1 chamber, consisting of 48 members, of whom 10 are chosen from the nobility, 12 from the towns, 10 from the rural districts, and 16 from the people at large. They are elected for 6 years, $\frac{1}{3}$ going out of office every 2 years. They assemble triennially on convocation by the duke, but in certain cases may meet without his authority. The duchy holds the 13th place in the German confederation, has 2 votes in the plenum assembly, 1 vote with Hanover in the diet of the German states, and contributes 2,096 men to the federal army. Its own force in time of war is 4,857 men. The public debt in 1855 was 7,168,524 thalers, including 4,078,000 thalers for railways, and the budget for the 3 years 1855-'6-'7 presented an aggregate revenue of 4,219,000 thalers, and the same aggregate amount of expenditure.—The capital of the

above-described duchy, of the same name, is situated on the Ocker, and connected by railways with the other cities of Germany. It is said to have been founded in the 9th century, by Bruno, was enlarged by Henry the Lion, ranked in the 13th century among the first cities of the Hanseatic league, and, although much less important than in former times, it continues to be one of the most active cities of N. W. Germany. The annual fairs held here are, after those of Leipsic and the 2 Frankforts, the most animated in Germany. The pork sausages of Brunswick (*Braunschweiger Wurst*), and its beer, have acquired great celebrity; the latter is known under the name *Braunschweiger Mumme*, after Christian Mumme, who was the first to prepare it, in 1492. The trade in this beer extended in former years to East India. The book trade is of great importance. The principal publishing house is that of Vieweg. Brunswick is the seat of a bank and of several banking establishments. The appearance of the town is antiquated, but there are several handsome streets and promenades. The new ducal palace is a magnificent building, with beautiful pleasure grounds. The most interesting monuments of the ancient cathedral of St. Blaize are the tombs of the ducal family, comprising that of Caroline of Brunswick, queen of George IV. There are 10 churches and a synagogue. The museum in the arsenal contains a gallery of valuable paintings. There are also many private galleries. The most prominent of the institutions of learning is the *Collegium Carolinum*, which was founded in 1745. Monuments have been erected to the 2 dukes of Brunswick who fell at Jena and at Quatre Bras; to the memory of Schill and his companions, 14 of whom were shot here; and to Lessing, who died here. Rietschel's statue in honor of Lessing was erected in 1853. The most extensive of the many charitable and sanitary institutions is a great asylum which accommodates 250 orphans. The town supports a good theatre and several journals, of which the *Deutsche Reichszeitung* is the best. Pop. about 38,000.

BRUNSWICK, HOUSE OF, one of the oldest families in Germany, a branch of which occupies the throne of Great Britain. The territory which now forms the duchy of Brunswick formerly belonged to the part of Saxony which Charlemagne united to his empire. With the other Saxon provinces it was governed successively by the princes of the houses of Saxe, Billung, Supplinburg, and Guelph. The Guelph house, of Italian origin, obtained, in the person of Otho the Young, in 1235, the city of Brunswick, as a fief of the empire, which, with its dependencies, was then first erected into a duchy. The 2 sons of Otho, Albert and John, reigned in common from 1252 to 1267, and then divided the paternal inheritance. John received the city of Hanover and the duchy of Lüneburg; Albert, the duchy of Brunswick, the Hartz, and the district of the Weser; the city

of Brunswick remained common property. John and Albert then founded the elder branches of Lüneburg and Wolfenbüttel. The first of these became extinct in 1269, and its possessions returned to the line of Wolfenbüttel. Albert left 3 sons, Henry, Albert the Great, and William, who divided the inheritance, and founded the 3 lines of Grubenhagen, Göttingen, and Wolfenbüttel. The first of these divided into 2 branches in 1361, both of which became extinct in 1606, and their possessions returned to the line of Wolfenbüttel. The Göttingen branch became extinct in 1458, and its possessions were transferred to the duke of Calenberg. From the Wolfenbüttel branch sprang in 1400 the 2 new branches of Lüneburg and Wolfenbüttel-Calenberg, the latter of which in 1634 transferred its possessions to the duke of Brunswick-Lüneburg-Dannenberg, a descendant of the Lüneburg branch. The Lüneburg branch had divided in 1569, and had another offshoot in the family of Brunswick-Lüneburg, which has furnished the electoral and royal dynasty of Lüneburg-Hanover. Henry, duke of Brunswick-Lüneburg-Dannenberg, who died in 1588, was the founder of the present dynasty of Brunswick. His line was divided in 1656 into the branches of Brunswick-Wolfenbüttel and Brunswick-Bevern, the former of which became extinct in 1735, the possessions passing to the latter, which has retained them undivided from that time to the present. Among the queens belonging to this family have been Sophia Dorothea, wife of George I, king of England; Amalia Elizabeth Caroline, the wife of George IV.; and Sophia Charlotte and Sophia Dorothea, queens of Prussia, the latter the mother of Frederic the Great. The first wife of Leopold, the present king of the Belgians, was Charlotte Augusta, daughter of Queen Caroline of England.—BRUNSWICK-LEONHARD, ERNST, duke, born in 1497, died in 1546, embraced the doctrines of Luther, signed the confession of Augsburg, adhered to the Smalkaldian league, and had his eulogy pronounced by Melancthon.—BRUNSWICK-LEONHARD, CHRISTIAN, duke, born in 1599, died in 1629, was attached during the 30 years' war to the elector palatine, Frederic V., who became king of Bohemia. After the flight of that prince he ravaged Hesse and the electorate of Mentz, was defeated by the imperialists on the Main, entered the service of the Dutch in 1622, forced the Spaniards to raise the siege of Berg-op-Zoom, but was afterward again defeated by Tilly. His motto was, "Friend of God, enemy of priests."—BRUNSWICK-LEONHARD, ERNST ANTOIN, duke, elector of Hanover, born in 1629, died in 1698, served the emperor Leopold I. in his war against France, for which he was rewarded with the electoral dignity in 1692. By his marriage with Sophia, daughter of the palatine Frederic V., and granddaughter of James I., king of England, his house obtained a right to the throne of England. His son, George Louis, subsequently became king of

England, with the title of George I.—BRUNSWICK-FRANCOIS, duke, a celebrated general in the 7 years' war, born at Brunswick, Jan. 13, 1721, died July 9, 1792, entered the Prussian army in 1739, assisted at the capture of Prague, obtained in 1767 the command of the Anglo-Hanoverian army, defeated the French and Hessians at Minden and at Crevelt, and in 1768, by reason of a disagreement with the king, retired to his castle at Vaeftelde, where he occupied himself with freemasonry, and became grand-master of nearly all the lodges in Germany.—BRUNSWICK, KARL WILHELM ERNST, duke, a Prussian general, born at Wolfenbüttel, Oct. 9, 1725, died near Altona, Nov. 10, 1806. His services during the 7 years' war were celebrated by Frederic the Great in a poem. He participated in the battle of Crevelt in 1758, and in 1797 marched into Holland to restore the hereditary stadtholder. After the treaty of Pilnitz he was intrusted with the command of the allied armies against France. He published at Coblenz in 1792 his famous manifesto, intending to march directly upon Paris, cut off supplies, and reduce that city by famine. He penetrated into Champagne, but was obliged, after the engagement at Valmy, to conclude an armistice with Dumouriez. In 1793 he commanded the army of the Rhine, reappeared in 1800, after an interval of retirement, at the head of the Prussian army, commanded at Jena, and was mortally wounded at the battle of Auerstadt. He was thought to have aspired to the crown of France after the fall of Louis XVI.—BRUNSWICK, FRANZ JOHANN WILHELM, 4th son of the preceding, a Prussian general in the Napoleonic wars, born Oct. 9, 1771, perished in the battle of Quatre-Bras, June 16, 1815. At the head of a body of hussars, which he raised in Bohemia, he entered upon the campaign of 1809, was obliged by Reubel to retreat, and to take refuge with his army in England, where he was received with distinction, returned to his country in 1813, and took part in the battles of Ligny and Quatre-Bras.—BRUNSWICK, FRIEDRICH ANTOIN WILHELM KARL, the eldest of the 2 surviving members of the oldest line of the Guelphs, son of the preceding, born at Brunswick, Oct. 30, 1804, succeeded his father, under tutelage, in 1815, took the government into his own hands, Oct. 30, 1823, was obliged by an insurrection, Sept. 1830, to seek safety in flight, was declared incapable of governing, and from that time has lived alternately in Paris and London.—BRUNSWICK, AUGUST LEOPOLD WILHELM MAXIMILIAN FRIEDRICH, younger brother of the preceding, the reigning duke, born April 25, 1806, succeeded to the duchy after the expulsion of his brother in 1830, rebuilt, in 1833, the castle of Brunswick, which had recently been burned, and founded in 1834 the order of Henry the Lion. As this prince is unmarried, the duchy of Brunswick, at his death, will be reunited to Hanover.

BRUNSWICK GREEN, a compound of chloride and oxide of copper and water, pre-

pared by oxidizing metallic copper in the air, by sprinkling it with a mixture of sulphate of copper, common salt, and water. It is also generated by the corrosion of copper in seawater. Its composition, as given by Berzelius, is 1 equivalent of the chloride and 3 equivalents of the oxide of copper. An artificial bicarbonate of copper, or mountain green, is also sometimes called Brunswick green. They are both used as pigments.

BRUNTON, MARY BALFOUR, an English novelist, born in the island of Barra, Nov. 1, 1778, died in Edinburgh, Dec. 19, 1818. At the age of 20, she married the Rev. Alexander Brunton, a minister of the Scottish church, and subsequently professor of oriental languages in the university of Edinburgh. She published a novel, "Self-Control," in 1801, which obtained immediate popularity from its moral tone, as well as its literary merits. This was followed by "Discipline," in which the same moral purpose is kept in view. Some months after her death, her husband published a volume of her "Remains," containing "Emmelina," a fragment in 100 pages, with a few shorter sketches, prefaced by a memoir of her life, with extracts from her correspondence. This fragment is written with great power, but so revolting is the subject, and so painful would have been the task of completing the story, that many critics have doubted whether she could have carried it to the close.

BRUSASOROI (DOMENICO RICCIO), a Venetian painter, born at Verona in 1494, died in 1567. He painted principally in fresco, and chose mythological subjects. At Verona he painted his celebrated "Coronation of Charles V." and the "Procession," in which appear the portraits of the emperor, Pope Clement VII., and other distinguished personages of the time. He also painted "Phaëton," in the ducal palace at Verona, and the "Martyrdom of St. Barbara."

BRUSH, a common name for a variety of implements, employed, some for removing dirt, some for smoothing and polishing surfaces of objects by rubbing, and some for laying on colors. They are usually made by inserting the bristles or hairs of animals in a firm support, which holds them in their proper arrangement, and at the same time serves as a handle. The great proportion of brushes, as nearly all the various kinds used for house purposes, including house painters' and whitewashers' brushes, and those employed about the person and clothing, as hair, tooth, clothes, shoe-brushes, &c., are manufactured of the bristles of the hog. They cause so large a demand, that bristles have become an important article of commerce. The great hog markets of the western states furnish the brush manufacturers of this country. England is supplied from Russia, the bristles from the Ukraine being preferred as superior to others. They are also imported from France, Germany, and Prussia. Previous to March, 1845, when the duty was repealed, the annual importations amounted to about

1,800,000 lbs., of which all but about 800,000 lbs. were from Russia. After this time they immediately exceeded 2,400,000 lbs.—The first process of the brush manufacturer is to sort the bristles according to their colors, unless he obtains them thus assorted. The divisions are into black, gray, yellow, white, and lilies. The last are the purest white, and are preferred for tooth and shaving brushes. Each kind is then assorted according to size, which is done by passing a bunch of them, held in the hand, between a row of steel points, like the teeth of a comb, which catch the coarser bristles. By using a succession of these combs of increasing fineness, the bristles are separated into as many heaps as desirable. Care is taken to keep them always arranged uniformly, the large or small ends of all pointing the same way. The cylindrical brush used by house painters is made by taking a bundle of bristles, and tying them firmly around their root ends. This bundle is then strongly bound between 2 prongs of a forked stick, and covered with a coating of glue and red lead. Another and more common method is to arrange the bristles around the small end of a conical stick, the small ends of the bristles pointing to the larger end of the stick. These being well secured by twine wrapping, and placed in a cup or socket with a hole in the bottom to let the handle pass through, this is driven home till the large end is buried in the centre of the bundle, tightening the fastenings and thoroughly securing the bristles.—The delicate brushes, called also hair pencils, used for water-colors, are made of the hair of the camel, goat, badger, sable, squirrel, &c., by binding a bundle of them together after being carefully arranged, and their points temporarily protected, and sliding this through the larger end of a quill, till the points project sufficiently far through the smaller end. The tube, having been previously softened by water, contracts as it dries, and holds the bundle of hairs fast. The best brushes of this kind are made of the hair taken from the tail of the kolinkski, a Russian sable.—Brushes, except those used for painting, are made for the most part by inserting little tufts of bristles into holes bored in rows into a stock of wood, bone, or ivory. The bristles are in some kinds secured by dipping their root ends into hot pitch, winding a piece of string round these ends, then dipping them again, and quickly introducing them with a twisting motion into the holes, where the pitch soon sets and holds them. The small ends of the bristles may be trimmed, and the stiffness be thus somewhat increased; but all such brushes are much softer and more flexible than those made by taking that portion of the bristle near the root end, and doubling it, so that it presents at one end a loop for securing it, and at the other 2 stiff points. For these the stock or board is sometimes prepared by boring the holes not quite through of the full size, but finishing them with a small bit. Each hole is correctly made in its proper place by a scale or pattern board,

of which great numbers are kept strictly perforated on hand, and one of which is clamped upon the face of the stock to be drilled. Each hole in the pattern is a mark for introducing the drill. Fastening the bristles is called drawing, and is commonly performed by women. They sit around a table, each with a clamp attached to its edge for holding the stock-board, and each supplied with a fine flexible brass wire which is held in the right hand, and an apron full of bristles. A loop of the wire is passed through a hole in the stock, and a number of bristles being laid in it, the wire is pulled tight, causing the bristles to double and be drawn into the hole. The same process is repeated with the next hole, and so on, until all are filled with bristles, which are held tightly in their places by the wire. They are then clipped by a pair of shears gauged to cut the length of bristles required. If the bristles are very long, the clipping is done as each row of holes is drawn. Persons skilled in this process have drawn as many as 500 tufts in an hour; but 100 an hour is a more common rate. In brushes that are to be exposed to acid liquors, that would corrode brass wire, as the stopping brush used by hatmakers, a cord is substituted. The brush is finished by gluing a thin veneer upon the back of the stock, which covers over and protects the wire. This, however, is still liable to corrode, if the brush is kept wet; but even if it rusts off, the tufts remain in their places, unless the wood gets very dry and shrinks, when they fall out. Other methods of drawing are employed in making the fine tooth and nail brushes. One is to score the fine silver wire (which is used instead of brass) in grooves upon the back of the stock, and fill these with a hard cement. A still neater mode is that called trepanning. The holes for the tufts are not drilled quite through the stock, but terminate in other longitudinal or transverse channels, which are perforated either edgewise or lengthwise close to the surface of the back of the stock. Of these channels there are as many as there are rows of tufts. Strong thread or silk supplies the place of wire, being introduced through the long channels to the holes, and then drawn. The mouths of the channels are finally closed with little plugs of bone or ivory, so neatly that they are rarely observed, and the work is then as durable and cleanly as if it were all one piece. There is a kind of brush used for cleaning bottles and some other purposes, made by introducing bristles between 2 or more parallel wires and twisting these together, which causes the bristles to radiate from the wires and form a brush of cylindrical shape.—Other materials used for brushes are horse-hair and goats' hair for some soft brushes, as hat brushes; the hair of the badger for shaving brushes; and for very hard brushes, fibres of whalebone and even wire. The whalebone is first softened by steeping it in water, and is then shaved into thin slices, which are split into fibres. These are cut into proper lengths, and

when dried are used like bristles. Wire brushes are employed for scrubbing the surfaces of metals preparatory to their receiving any coating, as silver, copper, or brass, for gilding, or gun barrels in the process of boring, &c. &c.

BRUSH TURKEY, a local name given by the colonists of Australia to a family of birds, the peculiar habits of which are, in many respects, among the most remarkable facts known in the history of the animal kingdom. In scientific nomenclature the several varieties of this group are now assigned to the family of *megapodidae*. There are but about 12 species in all known to belong to this family. All of these are restricted in their range to the eastern archipelagoes of Asia, and to Australia, especially to the latter. The *megapodidae* are now by general assent assigned to the order of *gallinae* of the class *aves*—*aves* of some authors. They are again subdivided into the sub-families of *talapodinae* and *megapodinae*. They are also known, both locally and in the works of authors, as New Holland vultures, native pheasants, and jungle fowl. To the most noticeable of this group, *talapodinae Lathamii*, the name of brush turkey is chiefly applied—a name derived from the facility with which it eludes pursuit by running through tangled brushwood. Some disagreement has existed among systematists whether it should be classed among the true vultures, or among gallinaceous birds. Since Swainson, however, who persisted in classing it among the *vulturinae*, no one has hesitated to place it among the *gallinae*, where its gregarious habits, and close connection with other genera whose place is indisputable, combine to fix it beyond all reasonable dispute. The most remarkable circumstance in the economy of this family is the manner in which the hatching of their eggs is effected. In some respects this is not unlike that of the ostrich, but is upon an entirely different principle. The brush turkey, when about to deposit her eggs, collects an almost incredible heap of decaying vegetable matter as their depository, and trusts entirely to the heat engendered by the process of decomposition for the development of her offspring. The heap is collected for this purpose, not by single pairs, but by the joint labors of several, and usually at an interval of several days previous to laying. These heaps are frequently so large as to contain 4 cart loads of materials thus collected, and are constructed in a perfectly pyramidal form. If undisturbed, the same site is resorted to year after year, the birds adding each season a fresh supply just before the period of laying. After the heap has thus been accumulated, and a sufficient time has intervened for the generation of the required heat, the eggs are deposited, some 12 inches apart, and all buried in the depth of 2 or more feet. They are uniformly placed with the larger end up, and in this position, carefully covered, are suffered to remain until they hatch. The chick, when produced, is fully feathered, and able to provide for its own wants from the shell. The

number of eggs deposited in a single heap is often very great. As many as a bushel are frequently taken from one of these collections, at a single time. From experiments that have been made in heaps collected by birds partially domesticated, the heat of their centre has been ascertained to range as high as 95° F. The *leipes ocellata*, another of this interesting group, deposits her eggs in mounds of sand alternating with layers of dried leaves and grasses. The eggs, as they are laid, are carefully covered up, but the parent birds never sit upon them. The rays of the sun, adding to the heat engendered by vegetable decomposition, supply the requisite means. According to Gray, this species deposit about 12 eggs each. These are separated by vegetable matter or by earth, and the whole, soon after they are laid, are covered up by a large heap of sand, scratched up by the pair and forming a mound 9 feet in diameter and 3 in height. The *megapodius tumulus* employs yet another, though analogous manner of hatching her eggs. This species construct large mounds of earth for the development of their ova. Well-authenticated accounts describe these mounds as often of an immense size, varying from those of 20 feet in circumference and 5 in height, to those of a diameter of 20 feet and a height of 15. In these the eggs are carefully covered up by the parent birds, and buried often to the depth of 6 feet. Other species of this family are found in nearly all the islands of the eastern archipelagos of Asia. Some of these merely deposit their eggs, in large numbers, in holes excavated on the sea-shore, to the depth of 2 or 3 feet. Nearly all the family, however, are more unequivocally mound-builders.

BRUSSELS, (Flemish *Brussel*, Fr. *Bruxelles*), the capital of Belgium, situated on the little river Senne. Lat. 50° 51' N., long. 4° 22' E. Pop. in 1857, including the suburbs, 166,801, showing an increase of about 16,000 over the preceding year, owing to the annexation of the fashionable and stately *quartier Léopold*. In the new town there are the royal palaces and the mansions of the nobility, the park, public promenades (the *Allée verte* being the most popular), the chambers of the legislative bodies, and the libraries and museums occupying the former residence of the Austrian viceroys; while in the old town there are the churches of the 14th and 15th centuries, with their superb oak carvings, stained glass windows and statues, the *hôtel de ville*, and the mansions of the former nobles and burghers of Brabant. The principal church is that of St. Gudule, an immense and ancient building in Gothic style, with 2 very lofty towers. The choir and transepts, as at present existing, were finished in 1273, the nave in the 14th century, and the towers in 1518. Its windows are filled with the richest stained glass in the Netherlands, and it contains a number of costly monuments of the dukes of Brabant. The high altar in this church is so arranged that by some ingenious machinery within, the sacred wafer descends apparently of itself, at

the moment when the priest is about to elevate the host. The pulpit is one of those wonderful specimens of Flemish oak carving. Another most interesting monument of the middle ages is the *hôtel de ville* in the *grande place*, a vast structure commenced in 1401. Its tower, of Gothic open work, rises to the height of 364 feet, and is crowned by a vane representing the figure of St. Michael, in gilded copper, 17 feet high. It is frequently stated, but erroneously, that the abdication of Charles V. took place in this edifice. The real scene of that strange pageant was the old ducal palace, burnt down in 1733, and which stood on the site of the *place royale* in another part of Brussels. The appearance of the ancient square, on one side of which is the *hôtel de ville*, and the others surrounded with the old Spanish buildings and the *Broekhuis* or *maison du roi*, is much the same as in the days of the duke of Alva. In this *Broekhuis*, Counts Egmont and Horn passed the last night prior to their execution, and from a window of the same building Alva looked upon the bloody spectacle. The square of the *hôtel de ville* has been the scene of nearly every popular commotion that has agitated Brabant. Within the present century it has swarmed with soldiers; as in 1815, when Wellington marched from Brussels to Waterloo, and 15 years later, during the revolution which resulted in the independence of Belgium. In the *place du petit saïlon* the Protestant confederates assembled to draw up their remonstrance to Margaret of Parma, regent of the Netherlands, and half sister to Philip II. The *palais des beaux arts*, formerly the regal residence of the Austrian governors, contains a very large collection of paintings, few of which, however, are remarkable; a *palais d'industrie*, or museum of models of machinery and inventions in the mechanic arts; and a noble library founded by the dukes of Burgundy in the 14th century, and enriched by successive sovereigns, which now contains 200,000 printed volumes, and 18,000 MSS., many of the latter superbly illuminated. A museum of antiquities attached to the building contains numerous curiosities. The private palace of the duke d'Arenberg is widely known for its exquisite pictures, library, objects of *vertu*, and a head supposed on the best authority to be the original of that of the central figure in the group of the Laocoön. The head in the Vatican, at one time in Paris, is a restoration, and for the one in possession of the duke d'Arenberg Napoleon offered weight for weight, gold for marble. The palace of the prince of Orange, formerly considered the richest residence in Europe, has of late years been dismantled, and its contents removed to the Hague. The picture gallery of the prince de Ligne abounds with remarkable pictures. The *galerie St. Hubert*, a splendid bazaar, extending from the *marché aux herbes* to the *rue de l'évêque*, was completed in 1847. An observatory was built in 1828. The academy of science and the *conservatoire de musique*, and other institutions of learning and art, are in a flourishing condition. There is a cor-

des artistes et littéraires, where lectures are delivered during the winter season; a *grand harmonie*, a *philharmonie*, and a *concert noble*. There are 4 public schools, 6 schools for poor children, and an equal number of institutions of learning supported by private means and by religious associations. The most extensive of the many charitable institutions is the *hôpital St. Jille*, with 600 beds. Brussels is the seat of the *société générale*, a bank which had charge of the public finance until May 5, 1850, when the *banque nationale* was founded. There are several other important banking establishments. In the stock exchange of Brussels a large amount of speculative business in foreign and national stocks, and railway and industrial shares, is carried on. Until 1864, when the reprinting of French works was stopped by law, Brussels derived considerable importance from this branch of the book trade. The book trade of Brussels, however, is still one of the most flourishing branches of activity of the town, Belgium contending to be the largest importer of French books. A complete system of railroads connects Brussels with all parts of the kingdom. Manufactures of a great number of commodities are carried on here. Brussels has been still celebrated, although this branch of industry has declined considerably. It excels most in the manufacture of looking-glasses and other objects made of glass and crystal, in the fabrication of carpets, and, above all, in that of carriages. The breweries of Brussels are noted for their successful imitation of Bavarian, English, and Scotch beer, and for a sort of beer called *fare*, and another sort of white beer called *bière de Louvain*. The theatre on the *place de la monnaie* was destroyed by fire Jan. 21, 1855, and rebuilt in 1856. There is a *théâtre des nouveautés* on the *boulevard de Louvain*, and a *théâtre de vanseille, rue de Nèlyus*, chiefly for Flemish plays. There are also a Vauxhall, a beautiful botanical garden, a smaller theatre in the park, a circus, and a large number of splendid coffee-houses. English church services is performed in 2 chapels, and the bookseller Mognardt, in the *place royale*, has a reading room for English and foreign newspapers, and an English circulating library. The concourse of strangers and residents of all nations is daily increasing, and contributes not a little to the prosperity of the Belgian capital. French is the conventional language of polite society in Brussels; but the masses of the people, and even many educated persons, retain the use of the Flemish and Walloon languages. The principal Belgian journals are issued at Brussels, the *Independence Belge* being the best known abroad. A journal in the Russian interest, *Le Nord*, is also published here. The *place des martyrs* contains a monument erected on the grave of about 200 victims of the revolution of 1830. Margaret of Austria was born in Brussels, as was Vesalius, the anatomist, to whom a statue has been erected in the *place des Martyrs*.

BRUTUS, DROMIUS JUNCTA, a Roman soldier,

executed 42 B. C. He served under Cæsar in the Gallic war, and in the civil war he commanded the fleet destined to besiege Massilia. Cæsar afterward appointed him to the government of further Gaul. Nevertheless he joined the conspiracy against Cæsar, and volunteered on the memorable day of March to conduct his friend and benefactor to the place of slaughter. When the tragedy was consummated, Decimus Brutus retired to Cisalpine Gaul, and there maintained himself for some time, but was ultimately deserted by his troops, betrayed to Antony, and put to death by order of that general.

BRUTUS, LUCIUS JUNCTA, sometimes called the Elder, to distinguish him from Marcus Junius, the slayer of Cæsar, lived about 200 B. C. According to the legend, he was the son of Marcus Junius and the elder daughter of Tarquin the Proud, the last king of Rome, and is represented as having saved his life from the cruelty of that prince by feigning idleness, whence he received the surname of Brutus. Yet we find him not only described as not persecuted, but trusted and favored by the king, who associated him with his own sons, Aruns and Titus, in a mission which he sent to Delphi to inquire into the meaning of a portent, which had caused much alarm at Rome. After receiving the reply to the question they were charged to propound, the young men thought it prudent to do a little vaticination on their own account, and inquired of the oracle which of the 3 should be king in Rome, no one of them being, it is observable, heir to that dignity. To this the voice replied, from the sanctuary: "Whichever shall first kiss his mother." So, on their return to Italy, Titus and Aruns ran unawares to the palace, seeking who first should embrace the queen mother; but Lucius Junius, as he landed from the galley, affected to stumble from the gang-plank, and falling prostrate, kissed the soil of Rome, and arose up satisfied that he had penetrated the meaning of the oracle, and had secured to himself the accession to the throne. Shortly afterward followed the rape of Lucretia, the wife of his cousin Tarquinus Collatinus, by Sextus, and the self-immolation of the injured lady, in the presence of her father, who brought with him Publius Valerius, and of her husband, with whom came Lucius Junius. All swore to avenge her wrongs, but Brutus drew the reeking weapon from the wound, and holding it on high, vowed to visit the deed upon King Tarquinus, and upon all his race, and to take rule that no man hereafter should be king in Rome. First the people of Collatia, whose the deed was done, and then, when they heard of it, those of Rome in their *curias*, and lastly the army, which lay before Ardea, rallied the deed; and the Tarquins, being expelled by universal consent, fled to Gabii and Capæ. The people met in their centuries, to elect 2 men who should govern the city in lieu of kings, whose tenure of office should be annual, and whom they called consuls; and they chose

Lucius Junius and Lucius Tarquinius of Collatia, thence called Collatinus, to be the consuls of the first year. But, shortly afterward, on reflecting that the second magistrate was still a Tarquin, the people took alarm, and requested him to abdicate his office, and withdraw from their city in all honor, that they might be liberated from their apprehensions, and no longer have a Tarquin ruling over them. He did so, and they elected Publius Valerius to be consul in his room, who received the name of Poplicola, from his popularity. But, after all seemed settled, some of the young men of Rome, of noble birth, regretting their ancient government, and averse to the republican simplicity which had supplanted the royal usages, conspired to bring back the Tarquins, and to reestablish royalty in Rome; and the sons of Lucius Junius, Titus, and Tiberius, were among the conspirators. The plot was discovered by a slave, and Lucius Junius sat in judgment on his own sons, and did not hesitate to do justice on them, but caused them to be scourged with rods, in accordance with the law, and then beheaded by his lictors, in the forum; and he neither turned aside his eyes, nor shed any tear over them; for they had been false to their country, and offended against the law; and "a man," he said, "may have many more children, but never can have but one country, even that which gave him birth." When the conspiracy was discovered, and so proved of no avail, for bringing back the Tarquins, that proud and daring family determined to return by force; and, with the favor of Porsena, king of the Etruscans, and Mamilius, prince of the Latins, and the vassals of their own family from Cære, and Agylla, and Tarquinii, they raised a great army, and invaded the Roman territories. It so chanced that Aruns, son of Tarquin, and Lucius Junius, the consul, encountered in advance of the main bodies of the army, at the head of detachments of horse, and riding at each other with levelled lances, transfixed each other, and both fell down dead. Then the cavalry met, and fought fiercely; but it was a drawn battle, and neither party had clearly prevailed in the fight, and both encamped on the ground face to face. During the night there came a great voice, greater than human, out of a wood hard by, making proclamation that "one man more had fallen on the part of the Etruscans than on that of the Romans, and that, therefore, the latter would come off victorious in the war." When the Etruscans heard the voice, they were afraid, and struck their tents, and marched home, leaving the Romans to enjoy the independence they had won, and to bury their dead consul with great honor. This is the legend of Lucius Junius, whom the Romans called Brutus, and whose posterity bore the name, given in the first place as a term of obloquy, esteeming it thenceforth as an ornament and a grace.—There has been much doubt and dispute as to the reality of the events related in the above legend. It may, however, be taken

as certain that "Brutus and Poplicola," to borrow the words of Dr. Arnold, "were, no doubt, real characters, yet fiction has been so busy with their actions, that history cannot venture to admit them within her proper domain." It is shown distinctly by Niebuhr, from the translation found in Polybius, made by himself from the brazen tables in the capitol, preserved in the archives of the ediles, of a treaty with Carthage of commerce and navigation, ratified in the first year of the commonwealth in the consulship of Brutus and Collatinus, that their names were recorded in that treaty, and that when it was made Rome was in possession of all the Latin country, and all the coast from Ostia beyond Terracina, probably along the whole shore-line of Campania to the confines of Italia, and also that she traded largely with Sicily, Sardinia, and the Libyan coast, to the westward of the Beautiful cape or Hermoan promontory, now Cape Bon; the treaty being entered into with a view to the preservation of the rights and privileges of 2 already great maritime nations. Notwithstanding Tuscan conquest, Gallic invasion, and consequent destruction of monuments, registers, and archives, the preservation of this one treaty indisputably fixes the fact of the abolition of a monarchical, and the establishment of a consular, form of government in Rome at this date; fixes the identity and authenticity of Brutus and Collatinus; sets aside, as worthless, the stories of Rome being merely a small, rude town, occupied by agriculturists and half-brigand soldiers, and proves her to have been already a large, wealthy, flourishing community, with regular navigation, regular commerce, and a government at once sufficiently well established and foresighted to frame regulations of trade with foreign powers for the increase of commercial facilities, and sufficiently powerful and well known abroad to treat on equal terms with great powers beyond the sea.

BRUTUS, MARCUS JUNIUS, the tyrannicide, the son of that Marcus Junius Brutus whom Pompey caused to be murdered, and of Servilia, the half sister of Cato, was born in the autumn of 85 B. C., died 42 B. C. He lost his father when he was only 8 years old, but his mother and uncles conducted his education with the utmost care. On the outbreak of the civil war, he followed the example of Cato, and joined the Pompeians, notwithstanding his aversion to their leader. In the engagement near Dyrrhachium, he very much distinguished himself, but after the defeat of his party at Pharsalia, he made his peace with Cæsar, and returned to Rome. On the termination of the Alexandrine war, Cæsar appointed him to the government of Cisalpine Gaul. In 44 B. C., he caused him to be made *prætor urbanus*, and promised him the consulship, and the province of Macedonia. But all the offices and honors, all the marks of friendship and esteem, which the dictator had, or might have, bestowed on him, could not hold Brutus to his al-

legiance. Even while recognizing the government of Caesar, by acting under it, he was induced by Cassius to join a conspiracy which had for its object the assassination of his patron. After the perpetration of this deed, and some ineffectual efforts to bring the Roman people to approve it, he retired into Macedonia, whence he subsequently went into Asia, where himself and Cassius raised a mighty force, with which they marched to encounter the triumvirs. The rival armies met near Philipp. In the first engagement Brutus was victorious, but being defeated in the second, he cast himself upon his sword, and put an end to his life.

BROUYERE, JEAN DE LA. See LA BROYERE.

BRUYS, COMTE DE. a Dutch traveller and painter, born at the Hague in 1653, died at an advanced age at Utrecht. He visited Rome in 1674, and for several years devoted himself to painting in different cities of Italy. After travelling through Asia Minor, Egypt, and the Egyptian lakes, he again resumed the practice of his art at Venice, and in 1698, in Holland, published an account of his adventures. From 1701 to 1709, he was travelling in Russia, Persia, India, and the islands of the Indian ocean, and on his return published a narrative, which was chiefly esteemed for the beauty of the accompanying plates.

BRYAN, an eastern county of Georgia, named in honor of Jonathan Bryan, bordering on the Atlantic; area, 472 sq. m. The Ogeechee river touches its N. E. boundary, and the Canoochee flows through it from W. to E. The soil is sandy. The surface, on the banks of the river, is undulating, and in other parts generally level. Much of the land is covered by pine forests. The productions in 1850, were 54,927 bushels of Indian corn, 38,117 of sweet potatoes, 536 bales of cotton, and 2,409,597 pounds of rice. There were 11 churches and 100 pupils attending public schools. The county is traversed by the projected route of the Savannah and Gulf railroad. Pop. in 1855, 3,354, of whom 2,050 were slaves. Value of land in 1856, \$514,745. Capital, Eden.

BRYAN, or BRYANT, SIR FRANCIS, an English soldier and poet of the 16th century, died in 1650. In 1629 he was ambassador in France; and in 1630 in Rome, to settle the matter of the divorce of Henry VIII. Under Edward VI. he marched against the Scots, and in the battle of Musselburgh commanded the light-horse. In 1549 he was appointed governor of Ireland, where he married the countess of Ormond. Some of his songs and sonnets were printed with those of Surrey and Wyatt.

BRYAN, GROOM, a native of Dublin, born in 1781, died in Jan. 1791, came to this country young, and settled in Philadelphia. After devoting several years to commercial pursuits, he became a politician, and was a member of the congress of 1763, which met to remonstrate with Great Britain. After the declaration of independence he became vice-president, and in

1778 president, of the supreme executive council of Pennsylvania. In 1770, in the legislature, he projected and carried through an act for the gradual abolition of slavery in the state. In 1780 he was appointed a judge of the supreme court of Pennsylvania, and in 1794, a member of the council of censors, both of which offices he filled till his death. He strenuously opposed the adoption of the federal constitution.

BRYAN, MICHAEL, an English author, born at Newcastle in 1707, died in London, March 21, 1821, wrote the "Biographical and Critical Dictionary of Painters and Engravers," of which an enlarged edition, by Mr. Stedley, was published in London in 1840.

BRYANT, JACOB, an English writer, born at Plymouth, 1715, died at Cyprienham, near Windsor, Nov. 14, 1804. He was graduated at Cambridge in 1740, and was tutor to the sons of Blandford, subsequently duke of Marlborough. In 1758 he became the duke's secretary, and accompanied him during his command in Germany, as master of the ordinance. After his return he received a lucrative appointment in the ordinance, and refused the mastership of the Charterhouse. He published, in 1767, "Observations and Inquiries relating to various parts of Ancient History," wherein he discusses the most abstruse and curious of questions. In 1774 appeared the first 2 volumes, followed in 1775 by a 3d, of his most noteworthy and elaborate work, "A New System or Analysis of Ancient Mythology, wherein an attempt is made to divest Tradition of Fable and to restore Truth to its Original Purity." This production is devoted to the history of the Cassanites, Palaagi, Scythia, Indoscythia, Celages, Edomites, and other nations. In order to "divest tradition of fable," he called to his aid etymological deductions, endeavoring to glean historical facts from the affinities of language. In 1775 he published "A Vindication of the Apamean Medals." In 1780 appeared his *Phœnicæ Flavione*, vindicating the testimony of Josephus concerning Christ. Priestley and he engaged the same year in a discussion on philosophical necessity. Bryant believed in the authenticity of the poems of Thomas Rowley (the Chatterton forgeries), and in 1781 published 3 volumes to prove the point. In the 7th volume of the "Archæologia," he furnished a paper on the Zingara or gypsy language. In 1790, in "A Dissertation concerning the War of Troy," &c., Bryant contended that no such city ever existed in Phrygia, and that no such war ever took place. His last literary labor consisted in preparing for the press a volume of "Dissertations on Various Subjects in the Old Testament," written more than 30 years before. This book is principally occupied with discussions of points in the Scriptural biographies of Balaam, Samson, Jonah, and Joshua.

BRYANT, SICOVOS, an Indian preacher, born about 1695, died May 8, 1775, was settled at Marshpee, Mass., in 1742, where he preached to the Indians in their own language during about

18 years, when he was dismissed, not being sufficiently economical in the management of the church accounts; he was also careless with regard to those whom he admitted to the church.

BRYANT, WILLIAM CULLEN, an American poet, born Nov. 3, 1794, at Cummington, Hampshire co., Mass. His father, Peter Bryant, was a distinguished local physician, who had also travelled considerably, and devoted much time to the culture of his mind. He took unusual interest in the intellectual and moral development of his children, and was rewarded in the case of all of them, and particularly in that of William, with early evidence of their proficiency. The poet, in his beautiful hymn to death, alludes feelingly to this parent in the lines beginning:

For he is in his grave, who taught my youth
The art of verse, and in the bud of life
Offered me to the muses;

which was no poetic exaggeration, but a literal truth. There are few instances of precocity more remarkable than that of Bryant. He communicated lines to the county gazette before he was 10 years of age, and in his 14th year his friends caused to be printed 2 considerable poems, the "Embargo," a political satire, and the "Spanish Revolution." These passed to a 2d edition the next year (1809), and such were their merits that, in the preface to that edition, it was found necessary to certify the production of them by a person so young, in order to remove the scepticism of the public. In his 19th year he wrote *Thanatopsis*, which still holds its place, in general estimation, as one of the most impressive poems in the language. He had in 1810 entered Williams college, where he was soon distinguished for his attainments in language and in polite literature. At the end of 2 years he took an honorable dismission, and engaged in the study of the law, at first with Judge Howe, in Worthington, Mass., and afterward with William Baylies, in Bridgewater. Admitted to the bar in 1815, he commenced practice in Plainfield, and afterward removed to Great Barrington. He speedily rose to a high rank in the local and state courts; but his tastes inclined him rather to letters than to law. In 1816 his poem "*Thanatopsis*" was published in the "North American Review," and introduced him to the acquaintance of Mr. Richard H. Dana, who was one of the club which then conducted the "Review." He contributed also several prose articles to that periodical. In 1821 he delivered before the Phi Beta Kappa society, at Harvard college, a didactic poem on the "Ages," and in that year several of his poems were collected in a volume at Cambridge, and obtained for him immediate recognition as a writer of the highest merit. He removed to the city of New York in 1825, and was engaged as an editor of the "New York Review," soon after merged into the "United States Review," to which he contributed several criticisms and poems, which increased his reputation. For these periodicals he received many

articles from his friends Dana and Halleck. In 1826 he connected himself with the "Evening Post" newspaper, under the editorial control of William Coleman. At that time it was inclined to what was termed federalism, and Mr. Bryant, whose tendencies were toward republicanism, sought to give it more and more a republican character. When he acquired an exclusive control of its columns, a few years later, he rendered it decidedly "democratic," taking ground openly in favor of freedom of trade, and against all partial or class legislation. From 1827 to 1830, Mr. Bryant was associated with Robert Sands and Gulian C. Verplanck in the editorship of the "Talisman," a highly successful annual; and he contributed about the same time the tales of "Medfield" and the "Skeleton's Cave" to a book entitled "Tales of the Glauber Spa." In 1832 a complete edition of his poems was published in New York, and a copy of it reaching Washington Irving, then in England, he caused an edition to be printed there, with a laudatory preface. It was most generously reviewed by John Wilson, in "Blackwood's Magazine," and from that time Mr. Bryant's reputation in England, and on the continent of Europe, has stood as high as it does in his own country. Having associated William Leggett with himself, in the management of the "Evening Post," he sailed with his family to Europe in the spring of 1834. He travelled extensively through France, Italy, and Germany, residing for months together at the principal capitals, and enlarging his knowledge of the languages and literatures of the leading nations. His poems bear witness to his familiarity with the Spanish, Italian, German, and French languages, which he has continued to cultivate. After returning to his native country, and resuming his professional labors for some years, Mr. Bryant went again to Europe in the year 1845. In 1849 he made a third visit, and extended his voyage into Egypt and Syria. The desultory letters written to his journal during these wanderings were published in a book called "Letters of a Traveller," soon after his last return. But in the intervals of these foreign journeys he had by no means neglected his own country, and the same volume contains evidences of his sojourn in nearly all parts of the United States, from Maine to Florida, and of a trip also to the island of Cuba. Mr. Bryant's love of nature is so pervading, and his habits so active, that he has scarcely allowed a year to pass without accomplishing a visit to some locality remarkable for its natural beauty or grandeur. An inveterate pedestrian, also, he is always delighted when he is able to make these visits on foot, and under circumstances in which he can control his movements, without regard to the exigencies of steamboats and railroads. About the year 1845 Mr. Bryant purchased "an old-time mansion," embowered in vines and flowers, near the beautiful village of Roslyn, on Long island, where he has since resided, earnest-

ly employing his leisure hours in the garden and the field. His love of art, at the same time, has been cherished by an intimate association with the more eminent artists of the country. In 1848 Mr. Bryant was called upon to deliver a funeral oration on Thomas Cole, his personal friend, and among the foremost of American landscape painters. Again, in 1853, on the occasion of the commemoration held in honor of the genius and worth of the late James Fenimore Cooper, and in view to the erection of a monument to that celebrated novelist in the city of New York, he was appointed to pronounce a discourse on his life and writings. Of his various writings in prose, it has been said that they contain "no superfluous word, no empty or showy phrase," but are marked throughout by "pure, manly, straightforward, and vigorous English." His poems are characterized by extreme purity and elegance in the choice of words, a compact and vigorous yet graceful diction, great delicacy of fancy, great dignity and elevation of thought, and a special yet profoundly solemn and religious philosophy. As a minute and sympathetic observer of nature, he is almost without a rival.—In person, Mr. Bryant is slender but symmetrical, with a large and well-formed head, and a peculiarly firm and erect carriage. His manners are reserved and simple, even to shyness; yet he does not avoid, while he does not court society; and to a rare amability he adds a thorough integrity of character. Mr. Bryant made another journey to Europe in 1867 and 1868, and has given graphic descriptions of the countries through which he passed, in a series of letters addressed to the "Evening Post." He was received with great distinction in the literary circles of Madrid, and an interesting account of his visit there was published in the Spanish newspapers.

BRYANIS, an Athenian statuary, who flourished in the 4th century B. C. He cast a statue in bronze of Seleucus, king of Syria, and assisted in adorning the mausoleum with bas-reliefs. He also executed 5 gigantic statues at Rhodes, a statue of Paeiphane, and other works. According to Clemens Alexandrinus, 3 of his statues were attributed by some to the celebrated Phidias.

BRYDGES, SIR SAMUEL EGERTON, an English author, born at Wootton Court, in Kent, 1702, died at Geneva, Sept. 8, 1837. He was educated at Cambridge. In 1790, after the death of the last duke of Chandos, he induced his elder brother, the Rev. E. T. Brydges, to prefer a claim to the ancient barony of Chandos, as a descendant from Anthony Brydges, 3d son of the 1st Lord Chandos. This claim was for many years before the house of lords, who finally decided against its validity in 1803. The claimant died in 1807, and Mr. Egerton Brydges, who succeeded him, insisted, with great pertinacity, that, though defeated in parliament, he could, when he pleased, assert his rights by common law. Consequently, he usually added to his signature the words, "Per

legem terræ, Chandos of Tudley." He now possessed considerable landed property in Kent, and made several unsuccessful attempts to obtain a seat in parliament, and was eventually elected for the borough of Maidstone, for which he sat from 1812 to 1815. He rarely spoke, and generally voted with the Tories. He specially directed his efforts to effect those changes in the poor laws and copyright act, which were made many years later. In 1813 he was created a baronet. On losing his seat in parliament, he visited many parts of the continent, returning to England in 1826, and remaining for 3 years; but his affairs becoming intricately embarrassed, he removed to Geneva, and remained in great seclusion until his death. The failure of his attempt to obtain a seat in the house of lords threw a gloom over his life, and from the querulous tone of his writings Prof. Wilson pronounced him to be the head of the mooping school of modern authors. His literary labors were varied and immense, including romances, poetry, criticism, politics, biography, genealogical antiquities, topography, and classical literature. The novel, "Mary de Clifford," is the best of his fictions. His "Recollections of Foreign Travel, on Life, Literature, and Self-Knowledge," is full of information, and there is much of value in his "Autobiography," containing anecdotes of his times, and the literary and political personages with whom he was long associated. Another curious work is his "Imaginary Biography." He also produced "Letters on the Character and Poetical Genius of Lord Byron." Shortly before his death, he stated, in "Fraser's Magazine," that he had written over 14,000 sonnets. He edited Milton's poetical works, appending an excellent memoir. His abilities as a genealogist, topographer, and bibliographer, are attested by his *Geneva Literaria* (10 vols.), *Koninkste* (4 vols.), *Theatrum Pastorum, Sive, mæta Illustrata, Les Terræ*, and "British Bibliographer." He also edited a "British Poetæ," crowded with various information, heraldic, genealogical, and personal.

BRYDONE, PATRICK, a Scottish traveller, born in 1741, died June 19, 1815. He commenced his travels for the purpose of making "discoveries as to the precise state and temperature of the air on the summits of the highest mountains in Europe." He passed through France, to the Alps and Apennines, made a tour through Sicily and Malta (1768), and after visiting the principal islands in the Mediterranean, returned to England in 1771, where he published an "Account of Travels," among the most striking passages of which are his account of the bursting of a thunder-storm under his feet on the Alps, and some curious remarks on the state of the atmosphere on the summit of Mount Etna. He considered electricity to influence many of the phenomena of nature, and to be "a 5th element, distinct from, and superior to, the other four."

BRYENNIUS, MARVEL, a Greek writer on

music, who flourished between A. D. 1282 and 1328. Dr. Wallis translated his works in 1680.

BRYNHILDA, a mystic personage, in the Scandinavian legends, variously represented as connected with Attila, Sigurd, and Gurnar, or Gunther, and playing the principal part in the series of extraordinary adventures attributed to those persons.

BRYONIA, or **BRYONIK**, a poisonous extract of bitter taste, prepared from the root of the *bryonia alba* and *dioica*, by the process for bitter extracts. It is of a yellowish brown color, soluble in water and alcohol, but not in ether. The plant *bryonia* (Gr. *βρυον*, to grow rapidly) is a wild creeper, with twisting tendrils and scarlet berries of a disagreeable odor. It is met with in different parts of Europe, where it is employed as a purgative medicine, and its berries in dyeing. Its root, when bruised and applied to the skin, is so highly irritant as to produce blisters. Over-doses of the extract have proved fatal by its poisonous qualities.

BRZESO LITEWSKI, or **BREST LITOWSKI**, a fortified town in the western part of Russia, government of Grodno, on the right bank of the river Bug, about 110 miles south of Grodno. It was formerly the capital of a Lithuanian palatinate, and contains an old castle, a high school, 3 churches, and a synagogue, and has a considerable transit trade. In 1794 Suwaroff gained here a victory over the Poles. Pop. 18,100; pop. of the district, 100,450.

BUA, a small island in the Adriatic, belonging to the Dalmatian district of Spalatro, is connected with the town of Trau by a bridge; pop. about 4,000. During the latter period of the Roman empire many political offenders and heretics were confined here. It contains 6 villages, of which Santa Croce, or Bua, is the principal; pop. about 1,400. The productions of the island comprise dates, wine, olives, and particularly asphaltum, of which there is a remarkable well.

BUACHE, PHILIPPE, a French geographer, born in Paris, Feb. 7, 1700, died Jan. 24, 1773. He spent 7 years in arranging a new repository of maps and charts. In 1729 he became chief geographer to the king, and in the following year a member of the academy of sciences, in which he had been the means of instituting a professorship of geography. His notions of geography were in some respects peculiar. He asserted that there was a vast continent about the south pole, traversed by lofty mountains and gigantic rivers. The suggestion, that at Behring's straits a connection between Asia and America might be traced, came from him.

BUACHE DE LA NEUVILLE, JEAN NICOLAS, a nephew of the preceding, and also a geographer, born Feb. 15, 1741, died Nov. 21, 1825. He instructed the royal princes, afterward Louis XVI. and XVIII., and Charles X., in geography. After the death of D'Anville, he became first geographer to the king, and keeper of the marine charts and log-books, in which capacity he prepared the charts and plans with

which La Pérouse was provided for his voyage of discovery. During the reign of terror he was deprived of his office, but was reinstated after the fall of Robespierre.

BUBASTIS, or **BUBASTUS**, a city of ancient Egypt, now in ruins; mentioned in the Old Testament as Phi-Beseth, now known by the name Tel-Bustak; situated in the delta of the Nile, S. W. of Tanis; was built in honor of the goddess Pasht, called by the Greeks Bubastis. This goddess was represented by the figure of a cat, and many mummied cats have been found in the tombs of Bubastis. On the N. side of the city commenced the canal between the Nile and the Red sea, constructed by Pharaoh Neco. Bubastis was taken by the Persians 852 B. C., and its walls dismantled. Among the ruins of this city have been found remains of costly and magnificent temples. Here were celebrated solemn feasts to the goddess Pasht, attended by people from all parts of Egypt, even to the number of 700,000 at one time, as is stated by Herodotus.

BUBBLE, a film of liquid substance blown into a globular form, by the gas or air with which it is filled. Bubbles rise naturally and burst upon the surface of waters, by the escape of carburetted hydrogen or other gases from the mud at the bottom. When blown in a mixture of soap and water, the film has sufficient adherence to rise in the air, and thus the bubbles form small balloons, particularly if filled with hydrogen gas. Filled with a mixture of hydrogen and oxygen, they may be exploded on the approach of a candle with a report like that of a pistol.

BUBNA UND LITTIZ, FERDINAND, count, an Austrian general, born at Zamerak, Bohemia, Nov. 26, 1768, died in Milan, June 6, 1825. His poverty forced him to join the infantry at the age of 16 as a volunteer. After the siege of Belgrade he was made standard-bearer, from which position he rose to the dignity of field-marshal. He was also charged with some important diplomatic negotiations. In 1821 he put down an insurrection in the north of Italy.

BUBONA, in Roman mythology, the goddess who presided over cows and oxen. Small statues of this goddess were placed in the niches of stables, and her likeness was often painted over the manger.

BUBULCUS, CAIUS JUNIUS, a Roman consul, lived about 800 B. C. He received the consulship thrice; was appointed dictator 802 B. C.; and waged successfully the war against the Æquians.

BUCC, SIR GEORGE, an English antiquary and historian, born in Lincolnshire in the 16th century, died in 1623. He wrote the "Third Universitie of England," and the "Art of Revels;" and is spoken of by Camden as "a person of excellent learning." His history of Richard III., in which he maintains that that monarch was deformed neither in body nor mind, constitutes his principal claim to distinction.

BUCCANEERS (Fr. *boucanier*, one who cures the flesh of wild animals), a name applied to

bands of French and English marine freebooters, who in the 17th century committed extensive depredations on commerce, and even extended their ravages to the mainland among the Spanish settlements of North America. The original buccanners were these settlers, chiefly French, who attempted to introduce themselves into the Antilles not long after their first conquest by the Spaniards. The Spaniards, however, wished to monopolize their possession, and when these settlers had been driven out of St. Christopher they took refuge in Hispaniola, a large part of which swarmed with droves of wild cattle. These they hunted, selling the hides to the Dutch trading at the sea-shores, in exchange for commodities of which they were destitute. Meanwhile the Spaniards looked with jealous eyes upon these new settlements, and lost no opportunity of harassing and destroying them; shooting down the buccanners, whether found singly or in numbers; hunting them through every part of the island, and frequently surprising parties when asleep and worn out with the fatigues of the chase, and cutting their throats without mercy. At length they bared the buccanners for self-preservation to adopt other pursuits than hunting; some accordingly became planters, but for the greater part, organizing in bands of rovers, began to return with compound interest the injuries they had sustained. They were bound by oath to render all assistance to each other, and to wreak the utmost vengeance on their foes, especially the Spaniards. If one of their number was killed by the enemy, he was to be signally avenged; those of them who were maimed in battle were compensated for their wounds according to their severity, while those rendered helpless for life were provided for by the whole body. Plunder from the enemy was shared, but thieving from a fellow buccancer was summarily punished. The stronghold of the buccanners had been formed in 1630, at the little island of Tortuga, where they had driven out the Spaniards, and erected fortifications. They went forth in bands of 50 to 100, at first only in open row-boats, attacking and boarding vessels with desperate ferocity. These boats, frequently so small that the crews had no room to lie down, were directed how to an enemy, while their marloemen would take aim at the ports of a vessel and pick off the gunners; as soon as they came near enough they threw out grappling irons, and closing with the foe poured upon her decks. They lay in wait for vessels passing from America to Europe; those which sailed the contrary way they seldom molested, knowing them to be laden only with cargoes which they could not readily sell, but on the return voyages they were sure to find valuable freights of gold and jewels. The Spanish galleons to particular attracted their attention, as sometimes the booty seized in them was enormous. Though the richly laden vessels usually sailed in fleets for protection, the buccanners followed them as they emerged from the gulf of Bahama, and if one by accident became separated from

the others, her doom was sealed. If her stores were such as to satisfy the rapacity of the pirates, she was permitted to proceed after being plundered; otherwise she was scuttled and her crew thrown overboard. Presently the French buccanners established themselves in St. Domingo, and the English in Jamaica, and the booty acquired in their marauding expeditions was spent in the most extravagant way. Indulging in the wildest licentiousness, immense sums were squandered in gaming and on their women in drunken revels and every imaginable kind of debauchery, until they had beggared themselves and were forced to embark in another expedition. At length to such a pitch did the depredations of these ruffians proceed, that Spanish commerce visibly declined, and Spanish ships scarce dared to venture to America. Alarmed for their own gains, the buccanners changed their tactics, and from pillaging vessels attacked fortified towns.—Many desperate characters made themselves conspicuous in these enterprises. One of them was a Frenchman, named Montbar, who had contracted a deadly hate of the Spaniards, by reading an account of their American conquests. He determined to join the buccanners for the purpose of executing his schemes of vengeance. On his passage to the West Indies he fell in with a Spanish ship, which, as usual, was at once boarded and the crew put to the sword. On arriving at the coast of St. Domingo he offered his services to the buccanners, not as commander, but as one who would be foremost in the fight. His offer was accepted, and on the same day, falling in with a vessel, he attacked her with fury, and scarcely left a Spaniard alive. He displayed the same spirit afterward on every occasion, and earned the title of the exterminator. The Spaniards now took the alarm and resolved to confine themselves within their settlements. This determination only stimulated the buccanners to greater efforts, in which they were much aided by one of their leaders, François L'Olonais, a man of the lowest origin, who had raised himself to be master of 3 boats and 22 men, with which he took a Spanish frigate on the coast of Cuba, and afterward at Port-au-Prince 4 more vessels despatched to seize him. He then sailed for Tortuga, and there meeting with Michel de Vasco, who had signalized himself by taking a Spanish galleon loaded with treasure under the very guns of Portobello, the 2 combined with 400 men, sailed (1666) to the bay of Venezuela, took a fort at its entrance, spiked the guns, and murdered the garrison, 250 in number. They then proceeded to Maracaibo, on the lake, and compelled it to capitulate. Disappointed in not finding treasure at Gibraltar, another town on the same shore, they fired it. An immense ransom was paid for Maracaibo, and the buccanners carried off beside the church bells, crosses, and pictures, intending to build a chapel at Tortuga, by way of thanks to Heaven for their success. But the most noted of all these freebooters, and the one whose name is now most readily re-

membered, was Henry Morgan, a Welshman. While L'Olonnais and De Basco were wasting in debauchery their ill-gotten gains from Venezuela, he sailed from Jamaica in Dec. 1670, surprised and took Portobello, and then directed his operations against Panama. He at first went to the island of St. Catharine to procure some guides if possible, and here the governor of a strong fortress, who might have beaten him off, no sooner found out who he was than he concerted with him to surrender on easy terms, and after keeping up for some time the farce of a cannonade, the buccaneers entered the place, demolished the fortifications, and carried off an immense quantity of ammunition. They then steered toward the Chagres river and took a fort at its entrance, after a gallant resistance from its commander, who was killed. Then leaving some of his vessels, Morgan sailed with sloop up the river 88 miles, to Cruces, and thence proceeded by land to Panama. He defeated some troops sent out to meet him, and then entered the city, where he found a prodigious booty, with which the buccaneers departed, after firing the place and carrying off a large number of prisoners.—In 1688 an expedition was planned by Van Horn, a native of Ostend, who had served among the French for the greater part of his lifetime; he owned a frigate, and joining a number of other ruffians as desperate as himself, with 6 vessels and 1,200 men, he sailed for Vera Cruz, and under cover of darkness landed, surprised the fort and barracks, and surrounded the churches whither the citizens had fled in terror for safety. The pirates then pillaged the city, and after they had secured every thing of value they proposed to the citizens to ransom their lives for about \$2,000,000. This proposal was at once accepted, and half of the money paid down forthwith, when the buccaneers became alarmed at the approach of troops as well as a fleet of 17 Spanish vessels, and made off, carrying with them 1,500 slaves, and sailing through the enemy's line unmolested. About a year later all the buccaneers were seized with a sudden passion for plundering Peru. Upward of 4,000 men joined in this movement, some sailing by way of the straits of Magellan, and others crossing the isthmus. Many cities along the coast were pillaged, and the inhabitants massacred; silver was so common that the buccaneers would not receive it in ransom, and would accept nothing but gold, pearls, or jewels.—While these events took place in the southern seas, an adventurer of the name of Grammont, a gentleman of good birth and education, and distinguished as a military man, but obliged to join the outlaws from his excesses with wine, women, and play, made a demonstration in 1685 against Campeachy. He landed with his party without opposition, but meeting 800 Spaniards outside of the town he defeated them, and the combatants all entered the place together. The buccaneers then turned the guns of the city against the citadel, but as these did little harm, they were preparing some plan to

surprise it when news was brought that it had been abandoned. Only one man remained faithful to his duty, refusing to quit his post, and Grammont was so pleased with his fidelity that he secured to him all his effects, beside rewarding him handsomely. After this the marauders spent upward of 2 months at Campeachy, and rifled the country of every thing valuable for 15 leagues around; proposing when their treasures were embarked that the governor, who was still in the field with 900 men, should ransom the city. On his refusing to do so, they burnt it to the ground, and then retired to St. Domingo.—In 1697 a squadron of 7 ships, under the command of a buccaneer named Pointis, with 1,200 men, sailed from Europe to attack Carthage. This was the greatest enterprise that the buccaneers ever attempted, but they were perfectly successful; the city was taken, and the booty seized amounted to nearly \$8,000,000. The rapacious commander managed to secure for himself nearly all of this immense sum, and the buccaneers exasperated with this treatment returned to Carthage, and there again secured enough to repay them for their losses; but on sailing for Europe they were attacked by a fleet of Dutch and English ships, in alliance with Spain, and most of their vessels captured or sunk. This was the last considerable exploit of the buccaneers; as the most remarkable of their leaders dropped off one by one, none were found to supply their places, so that by degrees the organizations fell to pieces; and moreover, many of them were induced to accept civil and military appointments to draw them from the piracy which governments had been unable to suppress.

BUCCARI, a free royal Austrian seaport town in the circle of Fiume in Croatia; pop. 7,800. It is on an arm of the gulf of Quarnero, and has a good harbor. It formerly belonged to the Zriny family, and upon the conspiracy of the latter in 1671 it was seized by Austria.

BUCCINUM (Lat. *buccina*, a trumpet), a genus of shells, the shape of many species of which is like that of a trumpet, while the sound of a trumpet may be produced by blowing into them. Their characteristics are a smooth, non-plicated columella of thick gibbous or flattened form, and a short canal at the base of the shell, abruptly curved away from the outer lip. Some species of this shell are often very large and handsome, so that they are used as parlor ornaments. Those commonly called harps are the most beautiful shells of this family.

BUCCLEUGH, or **BUCCLEUCH**, an ancient parish of Scotland, but now comprehended in the parish of Ettrick, Selkirkshire. It gives the title of duke to the head of the ancient and illustrious family of Scott. Buccleugh is also the name of a suburban parish of Edinburgh.

BUCELLAS, a village of Portugal, in Estremadura, surrounded by an excellent grape-growing district. It gives its name to a species of white wine produced in its vicinity.

BUCENTAUR, the gilded galley in which

The Venetian dogs used to sail over a portion of the Adriatic on every Ascension-day, accompanied by the ambassadors and senators, and assume that sea in the name of the republic by dropping a ring into it.

BUCEPHALUS, the charger which carried Alexander the Great through all his campaigns. His color was white, and he was called "Bucephalus" because he had a black mark resembling an ox's head on his forehead. The story is, that a certain Thessalian offered the horse for sale to Philip, but as none of his attendants or courtiers could manage him, the king ordered his owner to take him away; whereas Alexander, who was present, openly expressed his regret at losing so fine an animal. Philip immediately replied that he would buy the horse if his son could ride him. Alexander accepted the offer, and succeeded in the attempt. The horse would never suffer any person to mount him but Alexander.

BUCER, MAURITZ, a German reformer, born at Schlutstadt, in Alsace, in 1431, died Feb. 27, 1531. His real name was Kuhnorn (Cow-horn), which, according to the fashion among the learned of the time, he changed to a Greek analogue (*bucra*, ox, and *epos*, horn). Sent at the age of 7 years to a Dominican convent, he became the object of dislike and hostility by the independence of his sentiments, and was obliged to seek an asylum in the house of a friend. Afterward removed to Strasbourg, he became acquainted with the writings of Melancthon and Luther. After conferences with the latter he espoused the principles of the reformation. He was, however, inclined to favor the sentiments of Zwingli rather than those of Luther, though he was always a pacificator between them. This was a marked feature of his character. To the conference of Smalkald Hucer had brought a confession known in history as the confession of the 4 cities, from Constance, Memmingen, Strasbourg, and Lindau, which did not very well agree with the language of the memorable 15th article of the Augsburg confession. Bucer, ever ready with expedients, introduced into the confession an acknowledgment of a "presence of Christ for the hand and mouth," and so the 4 cities were saved to the league of Smalkald. In 1548 he was summoned to Augsburg to sign the *Interim*, an act by which Charles V. sought to make a temporary peace between the Catholics and Protestants until he should call a general council. Bucer, with all his peace-loving propensities, refused to sign this document, and rendered himself obnoxious to Charles. In this juncture he accepted the proposals of Cranmer to remove to England, and accordingly departed for that kingdom in 1549, where he was immediately appointed professor of theology at Oxenbridge. He lived, however, only 2 years after his removal. After he had been dead 6 years his body was dug up, in the reign of Mary, and chained upright to a stake, in company with that of Regius (who had left Germany at the

same time and for the same reasons), and burned, and his tomb demolished. Under Elizabeth the tombs of Bucer and Regius were rebuilt. Bucer's writings were both in Latin and German. A commentary on the Psalms deserves mention for its excellence, and for being published at first under an assumed name.

BUCH, LEOPOLD VON, a German geologist, was born at Stolpe, in the Prussian province of Brandenburg, April 23, 1774, died in Berlin, March 4, 1853. At 16 he was placed under the care of Werner at the mining academy of Freiberg, where Alexander von Humboldt was among his fellow-students. Von Buch made rapid progress, and manifested a peculiar aptitude for geological studies, as well as mineralogy. In 1797 he published his "Outlines of a Mineralogical Description of Lusatia," and his "Outlines of a Geognostic Description of Silesia." In these works he gives the results of his mineralogical and geological investigations of the mountains of Silesia, which had never previously been systematically explored. Werner, the director of the academy, had propounded the Neptunian theory of geological formation, and Von Buch, a young man, warmly espoused his master's theory. In his first investigations he classed basalt, granite, and mica-schist among the aqueous formations. In 1797 Von Buch met again with his old fellow-student at Salzburg, and while he was exploring Styria and the Alps in that neighborhood, Humboldt was engaged in some very important meteorological and astronomical researches in the same regions. In the spring of 1799 Von Buch pursued his geological excursions into Italy, and his investigations there unsettled his convictions of the truth of Werner's Neptunian theory; he inclined to the belief that the leucitic and pyroxenic varieties of basaltic rocks must be of igneous formation. In 1799 he went to Naples, and saw for the first time Mount Vesuvius, which he revisited on Aug. 12, 1805, in company with Humboldt and Gay-Lussac, the French savant, at the time of an eruption of the great volcano. In 1802 he visited the south of France and explored the regions of extinct volcanoes in Auvergne. The general aspect of the Pay-de-Dôme, with its cone of trachyte rock and its beds of basaltic lava, convinced him of the natural facts of igneous formations, and induced him to abandon Werner's exclusive doctrines of aqueous formation. The results of these geological researches were published in his *Geognostische Beobachtungen auf Reisen durch Deutschland und Italien* (2 vols. 8vo. Berlin, 1802-1809). From the south of Europe Von Buch turned to the north, and from July, 1805, to October, 1806, he explored the Scandinavian islands, carrying his investigations as far as the North cape, and establishing his headquarters in the desert island of Mageröe. The results of these researches were some very important discoveries with regard to the geological formation of the crust of the earth, the climatology of different regions, and the geographic

ical distribution of plants. Von Buch was the first to suggest the idea of the slow and gradual elevation of the land of Sweden above the level of the sea, from the region of Frederickshall as far as Abo. The results of these explorations were published in his "Travels in Norway and in Lapland," 2 vols. 8vo. Berlin, 1810. His explorations of the Alps, in Switzerland, and of the mountains in Germany, induced Von Buch to put forth the opinion that the highest chains of mountains have never been covered by the sea, but are the result of successive upheavings through fissures of the earth's crust, the parallel direction of which is indicated by the principal chains of mountains in the Alps. This suggestion had already been made by Avicenna, or Ibn-Sina, a celebrated Arabian physician of the 11th century, and it has since been developed into a general theory by Elie de Beaumont. About this time, also, Von Buch published his views, which have since been confirmed by the labors of Nöggerath, with regard to the formation of amygdaloid agates, or almond stones, in the porosities of melaphyre. In 1815 Von Buch went to the Canary islands, accompanied by Christian Smith, the Norwegian botanist, who perished in the unfortunate expedition of Capt. Tuckey at the mouth of the river Congo. The volcanic islands, with their gigantic peak of Teneriffe, became the basis of an elaborate series of investigations on the nature of volcanic activity, and the results produced by fire, which he published in his *Physikalische Beschreibung der Canarischen Inseln* (Berlin, 1825). He next visited the basaltic group of the Hebrides and the coasts of Ireland and Scotland. He continued his geological excursions and investigations, in fact, almost incessantly until the last day of his life. Eight months before he died he made another visit to the extinct volcanic regions of Auvergne in the south of France. His life was one continued round of observation, travel, and investigation. Being a bachelor, the ties of home did not obstruct his taste for travelling to any region of the globe where scientific curiosity attracted him. His journeys and his explorations were made mostly on foot; with a change of linen in his ample pockets and a geological hammer, he was equipped for any journey, and his own busy mind was all the company he needed in his travels. Such was the mode of life and the career of the man whom Alexander von Humboldt deems "the greatest geologist of the age."

BUCHAN, DAVID, a British voyager and explorer, born in 1780. He obtained a lieutenant's commission in the navy in 1806, and in 1810 commanded in that capacity the schooner *Adonis* on the Newfoundland station. His admiral, Sir John Duckworth, despatched him to the river Exploits, for the purpose of exploring the interior and opening a communication with the natives. He reached the mouth of the river in January, 1811, and with 84 men and 8 guides penetrated through the greatest difficulties 180 miles into the country. Finding

at length a village of wigwams, he took its inhabitants, 75 in number, captive, and treated them so well as to induce 4 to accompany him to a place where he had deposited presents for them. But so great was the hatred inspired by the cruelty of earlier travellers that Buchan on his return found the wigwams deserted and 2 of his sailors, whom he had left as hostages, beheaded and horribly mutilated. In 1816, Buchan was promoted to the rank of commander, and in 1818 was appointed to the command of an arctic expedition. The Greenland whalers having reported the sea to be remarkably clear of ice, the admiralty fitted out 2 expeditions that year—one to discover the north-west passage, the other to reach the north pole. The first was intrusted to Captain (soon Sir John) Ross and Lieutenant (soon Sir Edward) Parry, with the *Isabella* and *Alexander*. It proved unsuccessful, and much dissatisfaction was felt with its conduct. The *Dorothea* and *Trent* were the vessels selected for the other expedition, under Captain Buchan and Lieutenant (afterward Sir John) Franklin. Among the officers were several who have since greatly distinguished themselves in these voyages. The 2 vessels, admirably provided with all the scientific equipments of an arctic voyage, sailed in April and reached the place of rendezvous, Magdalena bay, Spitzbergen, about June 1. There they found walruses in abundance, and immense glaciers from the sides of which avalanches would fall every now and then with the crack of a thunder-clap. Before them rose that gigantic barrier of ice which has hitherto frustrated every effort to reach the north pole. Twice they attempted to penetrate it in vain. On June 7, they put to sea, and after several efforts to force a passage, were shut up for 18 days in a floe of ice within 8 miles of land, and with the water so shoal that they could see the bottom. At length the floe separated and bore to the south at the rate of 3 miles an hour. They reached the open sea and took shelter in Fair Haven. On July 6, finding that the ice was again driving northward, they emerged from their harbor and sailed northward until the barrier of ice closed upon them, reaching the latitude 80° 34' N., which was the most northerly point gained. They attempted in vain to drag the vessels on by ropes and ice-anchors, for the current carried them 3 miles an hour to the southward. The only result of the effort was the loss of several lives. Captain Buchan then stood over toward the coast of Greenland, but both vessels encountered a heavy gale of wind, which, with the constant shock from floating ice, so disabled the *Dorothea* that she was in a foundering condition. Lieutenant Franklin wished to try again with the *Trent*, which was much less damaged, but it was thought best that both vessels should go home together, which they accordingly did, after making such repairs as they could at Fair Haven. On

Aug. 30 they put to sea, and on Oct. 23 arrived at Deptford. In 1823, Buchan was promoted to the rank of captain, and commanded for some time on board the *Grasshopper* the Newburgh station. Two years afterward, he became high sheriff of that shire, which post he held for several years. He then went on a new expedition into the northern seas, from which he never returned. His ship is supposed to have been burned at sea, but nothing is known with certainty of the fact. In 1839, the admiralty struck his name from the list of living captains. The bad success of his arctic expeditions has deprived Buchan of the glory which his ability, perseverance, and courage deserve. He wrote no account of his voyage, but Captain Beechey, who served on board the *Trent*, has supplied the omission. Science is indebted to him for important observations upon marine under-currents, the variations of the magnetic needle, the temperature of the deep sea as compared with that of the surface, and the compression of the globe at the poles.

BUCHAN, ELIZABETH (SIMPSON), the founder of a Scotch sect, now extinct, born near Banff, in 1708, died in 1791. She was educated in the Scottish Episcopal church, but on her marriage to Robert Buchan, in Glasgow, became, like him, a burgher seceder. In 1773, or thereabout, she broached dogmas of her own, soon deserted her husband and moved to Irvine, where she made a number of converts, among them Mr. Hugh Whyte, a relief clergyman. In 1784, the people assailed Mr. Whyte's house, which the Buchanites had made their tabernacle. They then, 46 persons in all, set up a sort of community at a farm-house 13 miles from Dumfries, waiting for the millennium or the day of judgment, fasting for weeks in the expectation that they would be fed like the young ravens that cry, and abjuring all fleshly vanities. A few left, accusing Mrs. Buchan of tyranny and dishonesty, but the majority of her votaries were faithful to her to the last. She called her disciples around her death-bed and communicated to them, as a secret, that she was the virgin Mary, who had been wandering through the world since the Saviour's death, and that she was only going to sleep now, and would soon conduct them to the new Jerusalem. Her disciples, in the expectation of her re-appearance, refused to bury her until ordered by a justice of the peace.

BUCHAN, PETER, a Scotch antiquary, author of 2 volumes of "Ballads of the North of Scotland," and of kindred works, and celebrated for his enthusiasm for the legendary lore of his country, born in 1774, died in London, Sept. 25, 1854. He travelled over Scotland, collecting songs never before published, and thus brought a great number of Scotch ballads for the first time before the public.

BUCHAN, WILLIAM, physician, born at Ancrum, in Scotland, 1729, died in London, Feb. 25, 1806. After practising for a short

time in the north of England, where he distinguished himself by his successful treatment of the diseases of children, he removed to Edinburgh, where he graduated as M. D. Theses, in 1770, he published his "Domestic Medicines," of which, during his lifetime, 10 editions, each of 5,000, were published. It was translated into all the modern languages, has been constantly and largely reprinted in the United States, and obtained for the author, on its first success, a complimentary letter and gold medal from the empress of Russia.

BUCHAN, BENJAMIN, or, in Aberdeenshire, Scotland, near the town of Peterhead, and Slains Castle, the seat of the earls of Erroll, are described by Sir Walter Scott (who visited it in July, 1814) as "a huge rocky caldron, into which the sea rushes through a natural arch of rock." He walked round the top, and adds: "In one place the path is only about 2 feet wide, and a monstrous precipice on either side. We then roved into the caldron or hollow from beneath, and saw nothing around us but a regular wall of black rock, and nothing above but the blue sky. In the side of the caldron opens a deep black cavern." This place was visited by Dr. Johnson and James Boswell in August, 1773. In describing it, Boswell says that the furies of the tempest must have driven the sea through the rock. He adds: "We walked around this monstrous caldron. In some places the rock is very narrow, and on each side is a sea deep enough for a man-of-war to ride in, so that it is somewhat herrid to move along." The caves below were formerly used by smugglers. In a high gale, the sea rushes in with great force. An old fisherman told Scott that he had seen it flying over the natural wall of the hollow, which cannot be less than 200 feet high.

BUCHANAN, I. A north-western county of Missouri; area about 416 sq. m. The Missouri river separates it from the Indian territory; it is intersected by the Little Platte river, and drained by Castle and Livingston creeks. The soil is fertile, and the productions in 1850 amounted to 121,692 bushels of wheat, 1,055,718 of Indian corn, 65,540 of oats, and 30,078 pounds of wool. There were 3 grist mills, 9 saw mills, 2 newspaper offices, 6 churches, and 625 pupils attending public schools. Capital, St. Joseph. Pop. in 1853, 15,810, of whom 1,738 were slaves. **II.** A north-eastern county of Iowa; area, 576 sq. m. It is intersected by Wapsipicon river and Buffalo creek, and is well supplied with timber and water. The productions in 1856 were 2,055 tons of hay, 45,121 bushels of wheat, 41,762 of oats, 194,029 of Indian corn, 27,049 of potatoes, and 55,193 lbs. of butter. Capital, Independence. Pop. in 1856, 5,125.

BUCHANAN, CLAUDIUS, D. D., chaplain of the East India company, born near Glasgow in 1766, died in Roxborough, Eng., Feb. 9, 1815. In 1796 he was appointed chaplain of the East India company, and when the marquis Wellesley

founded a college at Fort William, he was nominated vice-provost and classical professor. He was the author of "Christian Researches," and other works, which had a great influence both in England and America in directing the attention of the religious public to the promotion of Christianity in India. He was employed in superintending an edition of the Syriac Testament at the time of his death.

BUCHANAN, Gzozax, a Scottish author of the 16th century, born in the beginning of Feb. 1506, died Sept. 28, 1582. He was sent to Paris about 1520 for his education, returned in about 2 years to Scotland, and in 1523 was engaged in a border foray and the storming of a castle in England. Two years later he took a degree at St. Andrew's, and in 1527 went again to Paris, where he remained connected with the university about 10 years. In 1537 he was again in Scotland, as tutor to one of the sons of King James, when he wrote some satirical poems directed against the monks and friars. The animosity of the church party, and especially of Cardinal Beaton, obliged him to flee, and he repaired successively to London, to Paris, to Bordeaux, and to Portugal. His occupation was probably that of teaching the rudiments of Latin in the universities, but he published 4 tragedies upon the classical model, and various odes and poems, by which his name became widely known. He returned to France in 1553, and in 1562 was at court in Scotland, and classical tutor to Queen Mary. As such he lived upon terms of apparent intimacy with her, and was made principal of St. Leonard's college, in 1566. He now openly declared himself a Protestant, and took the side of that party both in church and state, was a member and moderator of the assemblies of the church, and held some important secular offices. His *Frater Fraterrimi*, another satire upon the friars, was published in 1564. In 1566, and again in 1567, he collected and published an edition of his poems. He was the author of the "Detection of Queen Mary's Actions," before the tribunal appointed to examine her at York, in 1568, which was extensively circulated in England, and used to blacken her fame. On this account he has been subjected by her friends to accusations of the darkest treachery. In 1570 he was intrusted with the education of James VI., then 4 years old. The year 1579 was marked by the publication of his *De Jure Regni apud Scotos*, a treatise, under the form of a dialogue, concerning the institutions of Scotland, upon the principles of government and society. For nearly 2 centuries this book, which inculcates the doctrine that governments exist for the sake of the governed, was held up as containing the sum of all heresy and rebellion. It has had the honor of many courtly refutations, and of being burnt, together with the works of Milton, in 1683, at Oxford, and again, in 1684, received a formal condemnation and burning from the Scotch parliament. His last production, the *Rerum Scoticarum His-*

toria, in 20 books, was published in 1582, the year of his death, but he is now remembered chiefly for his translation of the psalms into Latin verse. His mother tongue was probably the Gaelic, but the celebrity of his writings has been to some extent due to the elegance of their latinity.

BUCHANAN, JAMES, 15th president of the United States, was born at a place called Stony Batter, in Franklin co., Penn., April 23, 1791. His father, James Buchanan, emigrated to the United States from the county of Donegal, Ireland, in the year 1788; his mother was Elizabeth Spear, daughter of a respectable farmer of Adams co., Penn. The father commenced life as a hardy pioneer, but, by successful industry, soon acquired that competency which enabled him to give his son a classical education. Mr. Buchanan graduated at Dickinson college, Carlisle, in 1809, with high honor. In Dec. of that year he commenced the study of the law in the office of James Hopkins, of Lancaster, and was admitted to the bar Nov. 17, 1812, being then little more than 21 years old. A lawyer of not more than 4 years' standing, and not over 25 years of age, he successfully defended, unaided by senior counsel, in the session of 1816-'17 of the Pennsylvania senate, a distinguished judge, who was tried upon articles of impeachment. His practice increased with his reputation, his professional business accumulated, and his name occurs oftener in the "Reports" of the state than that of any other lawyer of his time; thus he found himself, at the age of 40, enabled to retire from the profession. Once only after his retirement could he be prevailed upon to reappear at the bar, and that was in an action of ejectment, which involved the only little property of a widow. The case was surrounded by great technical difficulties, but Mr. Buchanan succeeded in establishing the widow's title. At the age of 28 Mr. Buchanan became a member of the Pennsylvania legislature. In the progress of the war of 1812 between the United States and England, the British had taken and destroyed the public buildings at Washington. This act caused a feeling of general indignation throughout the country. At a public meeting in Lancaster, Mr. Buchanan, though a federalist, made an appeal in favor of a vigorous prosecution of the war, while he himself headed a list of volunteers to march to the defence of Baltimore. The company was commanded by Judge Henry Shippen, Mr. Buchanan willingly taking the position of private soldier. They marched to Baltimore under the command of Major Charles Sterret Ridgely, but their services not being required, they were there honorably discharged. In the legislature, to which he was elected in Oct. 1814, he supported every measure of national defence. When Philadelphia was threatened, and the state of Pennsylvania was obliged to depend on her own resources for the means of repelling the British forces, Mr. Buchanan made the most urgent appeals to

the patriotism of the legislature to adopt efficient measures of relief. Being reelected to the legislature in 1813, he gave his ardent support to a bill, which was passed, appropriating the sum of \$400,000 as a loan to the United States, to pay the militia and volunteers of the state in the U. S. service. In 1820 Mr. Buchanan entered congress, and his first elaborate speech, delivered Jan. 11, 1822, on a deficiency in the military appropriation, was in support of federal authority, and in defence of Mr. Crawford, then secretary of the treasury. His speech on the bankrupt law, delivered March 12, took high constitutional ground. The law, as originally proposed, embraced only the mercantile classes, but an amendment was proposed, which extended it to all citizens of the Union. Against this Mr. Buchanan entered his protest. "We are now called upon," said he, "to decide the fate of a measure of awful importance. The most dreadful responsibility rests upon us. We are not now to determine merely whether a bankrupt law shall be extended to the trading classes of the community, but whether it shall embrace every citizen of the Union, and spread its demoralizing influence over the whole surface of society." Immediately after this speech the question was taken on the bill, and it was defeated by a vote of 99 yeas to 72 nays, a majority of the southern members voting against the bill. On the tariff question, which was subsequently discussed, Mr. Buchanan expressed the views which he has ever since maintained, to wit: that duties ought to be raised merely for revenue, though in the indirect operation of a tariff of duties, certain necessary domestic manufactures may be more benefited than others. "I confess," he said, when the debate had taken a sectional turn, "I never did expect to hear inflammatory speeches of this kind within these walls, which ought to be heard by union. I never did expect to hear the East counselling the South to resistance, that we might thus be detoured from prosecuting a measure of policy urged upon us by the necessities of the country. If I know myself, I am a politician neither of the East nor of the West, of the North nor of the South. I therefore shall forever avoid any expressions, the direct tendency of which must be to create sectional jealousies, sectional divisions, and, at length, disunion, that worst and last of all political calamities." At the next session of congress the tariff question came up as the "American system," a title bestowed on it by Mr. Clay; but Mr. Buchanan voted for it simply as a revenue measure, imperiously demanded by the exhausted state of the treasury. During the election of president by the house of representatives in 1825, Mr. Buchanan insisted on its taking place in presence of the people, with the galleries of the house open to the public, and not in secret conclave, as was suggested by some of the members and senators. He was opposed to the mission to Panama, projected and advocated with all the ardor and persuasive eloquence of Mr. Clay. Mr. Buchanan, as early

as 1824, had his misgivings as to the ultimate fate of Mexico and the South American republics, and he cautioned congress and the people of the United States against entangling alliances with them. The United States had strongly protested against the island of Cuba falling into the hands of any European power but Spain, and Mr. Buchanan was equally opposed to its being seized either by Mexico or Colombia. If either of them attempted to revolutionize Cuba, the emancipation of the slaves and a servile war would be the consequence. He held that Cuba is of immense commercial importance to the United States, but that in a practical and strategical point of view, it is of still greater consequence. It commands, from its geographical position, the entrance to the gulf of Mexico, so that any power in possession of it may, with a small naval force, blockade the mouth of the Mississippi, and thus effectually tie up one of the great arteries of our foreign commerce. The example of insurrection there might prove pernicious to the tranquillity and peace of the southern states, and spread desolation and ruin over our own country.—He took an active part in the presidential election of 1828, and the majority of 50,900, which Pennsylvania gave for Gen. Jackson, furnishes proof of the efficiency of his support. He himself was at the same time reelected to congress, and during the following session placed at the head of the judiciary committee, which position had previously been occupied by Daniel Webster. It was during this session that articles of impeachment were passed against a judicial officer, James H. Peck, judge of the district court of the U. S. for Missouri, upon which he was subsequently tried before the senate. The case was brief; in Dec. 1825, Judge Peck decided against the claims of the widow and children of one Antoine Boulard to certain lands in the state of Missouri and the then territory of Arkansas. Luke E. Lawless, of St. Louis, had been one of the counsel for prosecuting the claim, and when the decision of the judge in regard to the matter was published, Mr. Lawless wrote an article for a newspaper in which he, in respectful language, enumerated the errors into which the judge had fallen. Upon this, Judge Peck had him summoned, and not only deprived him of the right to act in his profession, but actually committed him to prison. Mr. Lawless made complaint to the house of representatives, where his memorial was referred to the committee on the judiciary. The committee unanimously reported articles of impeachment against the judge, which were adopted by the house and presented to the senate, and upon which the latter body resolved itself into a court of impeachment for his trial. Five managers were chosen by ballot on the part of the house to conduct the prosecution, viz.: James Buchanan of Penn., Henry R. Storrs of N. Y., George McDuffie of S. C., Andrew Spencer of N. Y., and Charles Wickliffe of Ky.

William Wirt and Jonathan Meredith were the counsel of Judge Peck. The trial was conducted with great ability on both sides, and became celebrated in the annals of American jurisprudence. Mr. Buchanan closed the case, confining himself solely to the legal and constitutional questions involved, and to pointing out the difference between the principles which govern English courts and those which under the constitution must govern those of the United States. Though the senate, by a vote of 23 to 21, refused to punish Judge Peck, it shortly afterward unanimously passed an act obviating whatever technical objections then stood in the way of his conviction, and so framed the law that no judge has since ventured to commit a similar offence. In 1831, at the close of his 5th term, Mr. Buchanan voluntarily withdrew from congress, but was soon afterward selected by Gen. Jackson as envoy extraordinary and minister plenipotentiary at St. Petersburg. In this capacity, he concluded the first commercial treaty between the United States and Russia, which secured to our merchants and navigators important privileges in the Baltic and Black seas. In 1833, on his return from St. Petersburg, Mr. Buchanan was elected to the U. S. senate. A great revulsion in politics had taken place during his absence from the country. A rupture had occurred between Gen. Jackson and Mr. Calhoun, which eventually led to the dissolution of Gen. Jackson's first cabinet; a new tariff had been enacted after an impassioned struggle, and the battle against the renewal of the charter of the U. S. bank had begun and been led to a final issue. The first symptoms of that sectional animosity which has since been gradually on the increase, were already observable in and out of congress. It was, indeed, impossible that such important measures as the removal of the deposits from the U. S. bank, the abrogation of its charter, the tariff and the force bill, should follow each other in quick succession and affect such a variety of interests, without exciting those who felt themselves aggrieved to the most determined resistance. That resistance extended even to the government officials, and with a man of Gen. Jackson's unbending character, naturally led to a pretty general removal from office. The cry of "proscription" was raised in consequence, and an attempt was made by Mr. Clay and his followers to deprive the president of the power of removal from office without the advice and consent of the senate. Mr. Buchanan argued the necessity of appointing officials by the president alone during the recess of congress, and exposed the personal hostility to Gen. Jackson which prompted all these proceedings. The opposition of the U. S. senate to the acts and measures of Gen. Jackson rose to historical importance, and only terminated with the close of that extraordinary man's career, when that body itself expunged the record of its animosity by a decisive vote.—During the session of 1835-'36, a new element was introduced into

national politics, as to which Mr. Buchanan has never made any secret of his views. As he perceived, the ideas of liberty and equality which swayed the public mind of Europe toward the close of the 18th century, had, in their indefinite expansion, embraced the cause of the African negroes. With the peace of Paris, in 1814, the doctrine of liberty and equality, as far as it related to Europeans, had effectually received its quietus; but the sovereign princes who, during the same year, met at the congress of Vienna, thought this a fit occasion to exhibit their regard for the negroes, in other words, to raise the standard of liberty for the blacks out of Europe, while that of the whites in Europe was hauled down and furled. The emperor of Russia, the king of Prussia, and the emperor of Austria, could without danger proclaim that every negro touching their soil should be free. They had none but white serfs, and there was no likelihood of negroes taking refuge in their countries. They could contend against the slave trade in which they had never been directly or indirectly interested, and they risked nothing in proclaiming the abstract right to freedom of the negro, after they had made a covenant among themselves to put down by force any struggle for constitutional liberty in Europe. The government which, about that time, was established in France on the embers and hot ashes of revolution, was but too glad to turn the attention of Europe to America, Africa, and the West Indies; while England, above all other countries, was most interested in holding up negro slavery to the scorn and detestation of Europe. The example of America had much to do with the first French revolution, and that brilliant example had to be tarnished and rendered odious by exhibiting the contrast of negro servitude. At the period referred to (1835), the slavery agitation was yet in its infancy; it was confined to a small body of persons who printed and published a few abolition papers in the north, and occasionally circulated copies of them in the southern states, through the mail. The only political bearing of the agitation was through petitions to congress for the abolition of slavery in the district of Columbia. Yet as insignificant as these incipient steps appeared to the majority of public men in the United States, Mr. Buchanan perceived the ultimate political consequences of the movement. He desired to stifle the agitation in the bud, by some act of congress which should prevent the question of slavery from being raised and discussed in that body. He wished to receive the petitions or memorials for the abolition of slavery in the district, and then declare, after respectfully considering them, that congress had no power to legislate on the subject. "I repeat," said Mr. Buchanan, "that I intended to make as strong a motion in this case as the circumstances would justify. It is necessary that we should use every constitutional effort to suppress the agitation which now dis-

turbs the land. This is necessary as much for the happiness and future prospects of the slaves as for the security of the master. Before this storm began to rage, the laws in regard to slaves had been really ameliorated by the slave-holding states; they enjoyed many privileges which were unknown in former times. In some of the slave states prospective and gradual emancipation was publicly and seriously discussed. But now, thanks to the efforts of the abolitionists, the slaves have been deprived of these privileges, and, while the infidelity of the Union is endangered, their prospect of final emancipation is delayed to an indefinite period. To leave this question where the constitution has left it, to the slave-holding states themselves, is equally dictated by a humane regard for the slaves as well as for their masters." Other statesmen, and among them Daniel Webster, who, at that time, opposed the motion of Mr. Buchanan, by degrees came to approve of it, and the senator from Massachusetts, in his celebrated 7th of March speech (1850), almost in as many words reechoed the views and sentiments of Mr. Buchanan on this subject.—It is hardly necessary to say that Mr. Buchanan sympathized with the struggle of the Texans against Santa Anna, then president of Mexico, and urged the recognition of the independence of Texas by the United States; so, too, at a subsequent period he advocated the admission of Texas into the union.—Toward the close of Gen. Jackson's administration, the French indemnity question had risen to a threatening importance. Gen. Jackson insisted on the prompt payment by France of the debt due to our citizens, and there really seems to have existed on the part of Louis Philippe, then king of the French, an honest disposition to discharge that debt. But the foreign policy of that unfortunate prince had already given umbrage to the opposition, his conduct in regard to the affairs of Poland and Italy had estranged the liberal party, and the suspicion that the care for his own family made him sacrifice the honor and glory of France, began to prevail. Accordingly when he recommended to the chambers to provide for paying the indemnity, the chamber of deputies rejected the proposal by a majority of 8 votes. This was simply a refusal of the indemnity by the French government, and Gen. Jackson thereupon demanded an appropriation of \$3,000,000 for the increase of the navy, and the defense of our maritime frontier. Mr. Buchanan, in supporting this demand of the president, reviewed the whole question, and so clearly established the justice of the claim, and the error into which the French government had fallen, that the payment of the money was no disgrace to France, and could by no one be ascribed to other than honorable motives.—A very important question arose on the admission of Michigan and Arkansas into the Union. Objection was made to the right of voting of resident aliens, which right Mr. Buchanan sustained; holding that aliens, who were residents of the north-western territory, had a right, under

the ordinance of 1787, to exercise the elective franchise.—Having been a supporter of Jackson's administration from the beginning, Mr. Buchanan gave the celebrated opposing resolutions, introduced by Mr. Benton, his ardent support. During Mr. Van Buren's presidential term, Mr. Buchanan's powers as a debater came especially into play. The whole talent and energy of the opposition were brought to bear on the leading measure of the administration—the establishment of an independent treasury. Clay, Webster, and John Davis, of Massachusetts, were especially pitted against Mr. Buchanan, in a combat which involved not only the success of the measure, but the ascendancy of the democratic party. Mr. Van Buren had not the same hold on the people's affections which distinguished his predecessor. He had been elected by a diminished majority of the popular vote, and the opposition, from this fact alone, had conceived new hopes of success. To defeat the independent treasury was to defeat Mr. Van Buren's administration, and to secure, in 1840, the election of a whig president. The presidential campaign was indeed recommenced at the very outset of Mr. Van Buren's administration. During Jackson's administration, Mr. Buchanan had been the leader of a victorious phalanx; under Mr. Van Buren he defended an unpopular measure, against an overwhelming combination of talent and circumstances. His arguments in support of the independent treasury, his review of the history of the late U. S. bank, his financial exposition of the wants of the country, his views on the currency, on the influence of mercantile institutions and corporations on the moral and political conditions of the country, may now be profitably consulted by the student of history.—The question of the preemption rights of settlers on the public lands being raised, Mr. Buchanan defended them on the ground of justice to the settler, and economy to the government. Another important question arose under Mr. Van Buren's administration in regard to the alleged interference of federal officers in elections. A bill was introduced which proposed to punish by a fine of \$500—the one moiety payable to the informer and the other to the United States—and by a perpetual disability to hold office under the United States, any officer of the government below the rank of a district attorney who should by word, message, or writing, or in any other manner whatsoever, endeavor to persuade any elector to give, or dissuade any elector from giving, his vote for the choice of any person to be elector of president and vice-president of the United States, or to be a senator or representative in congress, or to be a governor or lieutenant-governor, or senator or representative, within any state of the Union, or for the choice of any person to serve in any public office established by the law of any of the states. This measure was opposed by Mr. Buchanan with all the powers of his mind, and was soon abandoned.—The election of Gen. Harrison left the

democratic party, in both houses of congress and in the majority of states, in what was then deemed a hopeless minority. The revulsion in business had produced a revulsion in politics, and it was natural for the opposition to endeavor to regain in the shortest time the ground which they had lost during 12 years of democratic rule. One of the first measures introduced during the extraordinary session of 1841 was the repeal of the independent treasury. This accomplished, the way was paved for the recharter of a U. S. bank, but Gen. Harrison died before he had an opportunity of signing the bill, and his successor, John Tyler, vetoed it. Its successor, the "fiscal corporation," shared the same fate; not, however, before Mr. Buchanan had been afforded an opportunity of humorously opposing it.—On the arrest of McLeod, a person who had boasted of having been concerned in the outrage committed on the American steamboat *Caroline*, during the Canadian rebellion of 1837, and the demand of the British government for his surrender, Mr. Buchanan took ground against yielding to the demand, and contended that if McLeod were actually guilty, he should be tried and punished according to the laws of the state where the crime was committed. This view of the subject also prevailed with the administration. McLeod was tried for murder in the state of New York; but, as he was acquitted, the case received a natural solution independent of the action of either government. The repeated vetoes of President Tyler exasperated the whig majority in congress to such a degree that Mr. Clay seriously introduced a proposition to abolish the veto power conferred by the constitution on the president. On the other hand, Mr. Buchanan contended that, so far from limiting the power of the people, the veto power was a potent means of doing them justice. It was but a curb on the momentary supremacy of faction, and a means of safety to the people of the weaker states. Mr. Buchanan also opposed in secret session the ratification of the Webster-Ashburton treaty, not so much because the north-eastern boundary line between the United States and the British provinces of North America, determined by that treaty, did not correspond with what he thought it ought to be, as because he believed that it did not settle other matters of dispute then existing between the two governments.—The most important part of Mr. Tyler's administration consisted in the steps which he took for the annexation of Texas. Mr. Buchanan, as has already been stated, was one of the earliest advocates of that measure. In his remarks on the subject, he observed that: "While the annexation of Texas would afford that security to the southern and south-western slave states which they have a right to demand, it would, in some respects, operate prejudicially upon their immediate pecuniary interests; but to the middle and western, and more especially to the New

England states, it would be a source of un-mixed prosperity. It would extend their commerce, promote their manufactures, and increase their wealth. The New England states resisted with all their power the acquisition of Louisiana; and I ask, what would those states have been at this day without that territory? They will also resist the annexation of Texas with similar energy; although, after it has been acquired, it is they who will reap the chief pecuniary advantages from the acquisition." Mr. Buchanan urged immediate action, and adverted to the fact that had Mr. Jefferson delayed the acquisition of Louisiana but for one short month, that invaluable territory could not have been acquired without involving our country in war. The treaty of annexation received only 15 votes in the senate; nevertheless, after the election of President Polk, Texas was finally admitted by joint resolutions. Mr. Buchanan was the only member of the committee on foreign relations in the senate who reported favorably on the admission, and it was his last senatorial act.—With the accession of Mr. Polk to the presidency, Mr. Buchanan had, as secretary of state, the initiation of those measures which he had hitherto defended as chairman of the committee on foreign relations in the senate. England and America had both claimed the whole north-western territory—Mr. Polk in his message to congress, and the British premier in a speech in the British parliament. The protocol between Mr. Buchanan and Mr. Packenham induced England to accept the compromise line of lat. 49° N. Mr. Buchanan had felt himself obliged to offer this line, because Mr. Tyler had offered it before him, but it was rejected by Mr. Packenham. Hereupon Mr. Buchanan, in an elaborate state paper, exhibited the claims of the United States to the whole territory, and concluded by a formal withdrawal of his offer. This decided the fate of the controversy. It amounted virtually to a dismissal of Mr. Packenham as a negotiator, and shortly afterward produced a direct proposal from the British government to settle the boundary on the terms first proposed by Mr. Polk. The British government declared this to be its ultimatum. In this dilemma Mr. Polk referred the proposition to the senate, and the senate advised its acceptance.—Our difficulties with Mexico were not so easily settled. Irritated by the advance of our troops to Corpus Christi, she had crossed the Rio Grande, and commenced hostilities without a declaration of war. The president and his cabinet held that there was no alternative but to repel the attack by force, and to compel a settlement of all the outstanding questions at the cannon's mouth. Congress shared these views, and at once passed the necessary acts and appropriations. How that war was conducted without meeting with a single reverse, how our land and naval forces distinguished themselves by their skill and daring, how our volunteers participat-

ed in the glory of our regular army, and how the war at last terminated with the capture of the enemy's capital, let history tell. Mr. Buchanan's office was to aid the president with his counsel, and to watch for a favorable opportunity to conclude a peace at once advantageous and honorable to the country. That opportunity arrived; an armistice was concluded, and a treaty of peace followed, which added vast possessions and wealth to the republic. It has been contended that still better terms might have been obtained—that the Sierra Madre might have been made the boundary line between the United States and Mexico. This may be so. Additional territory might, perhaps, have been acquired, but not without additional sacrifice of blood and treasure. To avoid European intervention, in the shape of mediation or guarantees, was the main object of Mr. Buchanan, as set forth in his instructions to Mr. Silldell, our minister to Mexico.—At the close of Mr. Polk's administration, Mr. Buchanan retired to private life; but his views of passing events were freely expressed on all occasions. He watched with sorrow and apprehension the progress of the slavery agitation in the northern states. He believed that it must, in the end, lead to an agitation in the opposite direction, in the southern states, and that great national calamities must result from the movement. He regarded it as a stigma on his native state, that the Wilkes proviso should have been set in motion by a member of congress for Pennsylvania, and brought the whole energy of his mind to bear against that measure. At an early period, while yet in the cabinet of Mr. Polk, he wrote his Harvest Home letter to his friends in Pennsylvania, advising the extension of the Missouri compromise line of lat. 36° 30' N. to the Pacific ocean; but the proposition, when introduced into congress, was voted down. At last, by the joint efforts of Clay, Webster, Cass, and their friends in both houses, the compromise measures of 1850 were passed, which gave to the country a temporary respite from sectional agitation. Soon after the passage of these measures, Mr. Buchanan wrote a letter to a union meeting held in Philadelphia, in which he fully approved them, stating the reasons why the people should acquiesce in them, and exhorting them in most emphatic language to do their whole duty as citizens of a confederate republic.—One of the first acts of Mr. Pierce's administration was the appointment of Mr. Buchanan as minister to England. A principal object of his mission was the Central American question, which the so-called Clayton-Bulwer treaty had complicated, but not settled. Mr. Buchanan discussed the whole matter in an elaborate and perspicuous protest, but unfortunately the controversy still exists. Our relations with Spain also came under his notice. Various causes of complaint had arisen on our part, and at last one of our vessels, the *Black Warrior*, was fired into by a Spanish war steamer on the coast of Cuba. President Pierce thought this

opportunity had arrived for settling all difficulties at once by a proposal to purchase the island of Cuba at a price which no other nation but the people of the United States would be willing to pay for it, and which should enable Spain to extricate herself from her financial embarrassments. This delicate negotiation was confided to Mr. Sould, then our minister to the court of Madrid; but the fact being well known that Spain, since 1839 (the period of the quadruple alliance between her and the powers of England, France, and Portugal), has been more or less dependent on France and England, not only in her foreign policy, but also in all important matters regulating her internal affairs and the very nature of her government, the president thought it advisable that our ministers to England and France should act in concert with Mr. Sould, and for that purpose meet at some place on the continent of Europe, not subject to either of the powers named, and there confer freely as to the course of action most likely to produce the desired result. Ostend was first selected for the place of meeting; but the conference was subsequently adjourned to Aix la Chapelle. The American ministers kept written minutes of their proceedings, and of the conclusions arrived at, for the purpose of future reference and the information of their government at home. These minutes were afterward styled a "protocol," though they contained nothing but memoranda to be forwarded for consideration to the authorities in Washington. They were not intended to be submitted to a foreign power. They contained no proposition, laid down no rule of action, and in no manner whatever interfered with our regular diplomatic intercourse. The president desired to know the opinions of our ministers abroad on a subject which deeply concerned the United States, and the ministers were bound to furnish it to him. Their minutes exhibited the importance of the island to the United States, in a commercial and strategical point of view, the advantages that would accrue to Spain from the sale of it at a fair price, such as the United States might be willing to pay for it, the difficulty which Spain would encounter in endeavoring to keep possession of it by mere military power, the sympathy of the people of the United States with the inhabitants of the island, and, finally, the possibility that Spain, as a last resort, might endeavor to Africanize Cuba, and become instrumental in the retreating of the scenes of St. Domingo. The American ministers believed that in case Cuba was about to be transformed into another St. Domingo, the example might act perniciously on the slave population of the southern states of our own confederacy, and there exists the blacks to similar deeds of violence. In this case, they held that the instinct of self-preservation would call for the armed intervention of the United States, and we should be justified in wresting the island by force from Spain.—Mr. Buchanan returned to the United States in April, 1855. The common

council of the city of New York tendered him the hospitalities of the city, and his whole journey thence to Lancaster, Penn., his home, resembled a triumphal march. The democratic convention, which assembled at Cincinnati in June following, nominated him unanimously for the presidency, and he was elected, receiving 174 electoral votes from 19 states.—Immediately after his election the popular passions, which had divided the Union almost into 2 hostile camps, began at once to subside, so that, at the time of his inauguration, in March, 1857, the country looked forward with confidence to a period of political calm, and to a new era of national prosperity. But the Kansas territorial question, which had so largely entered into the presidential canvass, was still unsolved; the Central American difficulties had not been settled by the Dallas-Clarendon treaty; no decided steps had as yet been taken in regard to the fillibuster movements which embroiled our foreign relations; and the claims of our citizens against Spain remained wholly unadjusted. The country, it is true, had become tired of the slavery agitation; but the expectation was raised that it would be impossible for Mr. Buchanan to satisfy both sections, and to enlist the representatives of both in his support. Mr. Buchanan, however, took an early opportunity to let his sentiments on the Kansas question be known to the public. In an address which he delivered to the students of Franklin and Marshall college, at Lancaster, in Nov. 1856, Mr. Buchanan remarked that the object of his administration would be to destroy any sectional party, no matter where it existed, whether in the North or in the South, and to restore, if possible, that national, fraternal feeling between the different states, that had existed during the days of the fathers of our republic. So, in his inaugural address, delivered in March, 1857, he clearly expressed himself on the slavery agitation, and the mode in which the difficulties in Kansas were to be settled. But there was a party in Kansas which, firmly believing that they constituted the majority of the people, refused to obey the laws enacted by the local legislature of the territory, though these laws had been recognized by congress; and they went so far in opposition to them, that they elected a rival legislature, which attempted to enact different laws for the government of the people of the territory. These acts the president, in his capacity of chief executive officer, could not recognize as legal, while the governor of the territory himself pronounced them revolutionary, and required the presence of federal troops to preserve the public peace. Meanwhile, that territorial legislature recognized by congress passed an act for the election by the people of delegates to a convention to frame a constitution for the state of Kansas. An election was accordingly held, and the delegates returned met at Leocompton, and proceeded to perform their task. It has been objected by

the opponents of Mr. Buchanan's administration, that frauds were committed during this election, that some counties were not represented at all, and that the convention did not represent the majority of the people. To this the friends of the administration replied, that every facility was given to the voters, that frauds were committed on both sides, that all the populous counties were represented, and that when a majority refuse to vote, as it is alleged was done during the election of members of the convention, the men thus abstaining from exercising the franchise, are construed to abide by the act of those who do vote, no matter whether the voters constitute a majority or a minority of the electors. The convention, after a protracted session, completed its work; but, contrary to the general expectation, submitted nothing but the slavery clause to the ratification of the people. Now it was contended by some that the convention was bound to submit the whole constitution to a vote of the people; while others, though they would have preferred that mode of action, held that there were examples enough on record in the history of admissions of states, in which the constitution framed by the convention was not submitted to the people, and that, therefore, this omission could not invalidate the act of the convention in a legal or constitutional point of view. Beside, it was contended that the convention had submitted the most important part—the slavery clause—to a direct vote of the people, declaring that if the clause were voted down no slavery should exist in the state. While this new agitation for "popular sovereignty" was going on, and before the people had voted on the clause submitted to their approval, congress assembled. Mr. Buchanan thought this the proper time for stating his views on the subject, though he refrained from making an actual recommendation to congress. In his treatment of this question Mr. Buchanan had no other object than to act as peace-maker between the 2 great geographical sections of the Union. All men foresaw that Kansas must be a free state; but he held, that if the question was settled by the admission of the state with the Leocompton constitution, then the South could not complain that its rights had been abandoned and prejudiced; while the North, which was sure of enjoying the substance of the quarrel, could well yield that point. The president also held to the power of the people of Kansas to "change their constitution within a brief period" after being admitted into the Union, notwithstanding a clause in the constitution, which, after the year 1864, requires a two-thirds vote for that purpose. Mr. Buchanan considered that clause to be null and void by the very declaration of rights, and corroborated this view in a special message to congress, Feb. 2, 1856, after the Leocompton constitution, with the slavery clause in it, had been submitted to congress. The admission of Kansas with the Leocompton constitution

passed the senate by a handsome majority; but it was defeated by a small majority in the house. A committee of conference, however, was asked for by the senate, and agreed to in the house, which led to the passage of a new bill in spirit much the same as that which had been lost in the house, but submitting the whole subject indirectly to the vote of the people of Kansas. If the vote is cast in the affirmative, then the president is authorized to admit Kansas as a state by proclamation; in the opposite case, she shall not have the right to present herself again for admission till she shall have the requisite population to entitle her, under the constitution of the United States, to at least one member of congress. In the spirit of conciliation, and the latter clause being conformable to his own views as expressed in his annual message above quoted, Mr. Buchanan gave his assent to this bill.—A rebellion in Utah also came to a head shortly after Mr. Buchanan's accession to office. The Mormons had assumed an air of defiance against the government of the United States, and openly resisted its authority. They treated the loyal citizens of the United States as Gentiles and enemies, and formed dangerous alliances with the Indians, while increasing their ranks by constant accessions of emigrants from Europe, sharing the same doctrines with themselves. Mr. Buchanan resolved to crush the spirit of resistance to law and order in the territory, by bringing the offenders against it to condign punishment. For this purpose, a military expedition was organized against Utah, whose numbers and appointments were such as to preclude all apprehension of its failure. At the same time, in order to avoid the effusion of blood and the expense of a prolonged guerrilla warfare in that mountainous country, the president sanctioned, in Jan. 1858, that Col. Thomas L. Kane, who had in former years greatly befriended the Mormons in a time of famine, should go out to their country to endeavor to bring them to peaceful submission to the laws; and in order more decidedly to evince this humane disposition, two well-known citizens were appointed in April as peace commissioners to accompany the army. The efforts of Col. Kane proved successful; and on June 7, Mr. Buchanan communicated to congress the gratifying fact that the rebellion was ended by the submission of the Mormons, and that the reinforcements ordered for the army would not be required.

BUCHAREST, the capital and chief commercialemporium of Wallachia. It carries on an active trade in grain, wool, honey, wax, cattle, wine, and particularly in hides. In the vicinity of the town are extensive slaughter-houses (*sol-khanes*), noted for excellent tallow and smoked meat. There are manufactories of linen, carpets, bags, and of beads and necklaces. Cloth, glass, and porcelain are imported in large quantities from Germany. The manufacture of Turkish cloth and of gold and silver wares is chiefly in the hands of Germans, of whom

there are not less than 35,000, comprising many Jews. There are also many Spanish and Portuguese Jews, Greeks, and Armenians engaged in commercial pursuits. The warehouses are laid out in distinct quarters. Thus there is a quarter of the *Leipsicists*, i. e. Leipsic merchants, who draw their supplies from the annual fairs at Leipsic; that of the *Armenians*, or grocers; of the *Serfs*, or bankers; of the *Kojakars*, or furriers; of the *Abadjis*, or outfitting establishments; of the *Tschoukalis*, or toy dealers; of the *Mitchakars*, or butchers; of the *Serzumschis*, or green-grocers; of the *Shavenshikis*, or music dealers and musicians; of the *Kafekars*, or confectioners; and of the *Fervars*, or hardware dealers. The millinery establishments are in the aristocratic quarters of the boyars, and the bakers and innkeepers are to be found all over the town. There are also distinct quarters for the Jews (*the Dera*), for the Armenians, Serbians, Bulgarians, Germans, and French.—Bucharest is the residence of the hospodar, of the Greek archbishop, of the provincial administration and courts of law, and of the foreign consuls. There are about 100 churches, 30 Greek convents, 3 synagogues, a museum with a public library, a central metropolian seminary, a society for literature and natural history, 65 schools attended by about 1,500 pupils, 6 hospitals conducted by sisters of charity, an opera house, a corso to which the fashionable resort in great numbers, a great bazaar, and a remarkable abundance of coffee-houses. The city was founded by Ruel the Black, or Negro Wod, who conquered Wallachia toward the close of the 10th century. At the end of the 15th century it fell into the hands of the Turks, who burnt it. On Oct. 30, 1771, the Turks were defeated here by the Russians. Under the treaty of peace concluded here in 1773, the town was restored to Turkey in the following year. By the treaty concluded here, May 26, 1813, the sovereignty of Wallachia was confirmed to Turkey, but under the protectorate of Russia. In 1821, a revolt broke out among the Greek population, which called in a Turkish garrison. In 1828, the Russians took possession of the town until 1829, when the treaty of peace of Adrianople brought it under the rule of the hospodar of Wallachia, in subordination to the supreme authority of Turkey. The town was desolated by a great fire, April 4, 1847. In June, 1848, a rebellion broke out against Prince Bibesco. Turkish forces occupied the town in September, and Russian troops in October of the same year, and were stationed here until May, 1851. In July, 1859, after the outbreak of the Turkish war, Bucharest was again occupied by Russian soldiers, until Aug. 1854, from which time Austrian forces were quartered there until March, 1857. The international congress for the adjustment of the affairs of the Danubian principalities, in accordance with the regulations of the peace-conference of Paris, was held at Bucharest in 1856. The town is in a dilapidated condition. The handsomest buildings are the hospodars'

palace, the metropolitan church, and the Austrian consulate. French literature is the favorite study, and the French language is frequently spoken by the educated classes. The inhabitants are noted for their frivolity and extravagant love of pleasure. Journalism is not flourishing in Bucharest, the *Dukareschter Zeitung* having ceased to appear in 1854, and the only prominent journal now being the *Bulletin*, which is an official organ. The extent of the town, which is about 4 miles from north to south, and nearly 8 from east to west, would admit of a population of 400,000; the actual inhabitants, however, are only 107,000.

BUCHARIA. See BOKHARA.

BUCHER, ANTON VON, a German divine, born in 1746, in Munich, died there in 1817. He was superintendent of the schools in Munich in 1771, and in 1778, upon the abolition of the order of Jesuits, he became rector of the gymnasium and lyceum. He was an indefatigable opponent of the Jesuits, against whom several of his writings were directed.

BUCHEZ, PHILIPPE JOSEPH BENJAMIN, a French writer, who was, for a short time, president of the national assembly in 1848, born at Matagne, in the then department of Ardennes, March 31, 1796. He commenced the study of medicine in 1815, and received his degree in 1825. He was a violent opponent of the restoration, was engaged in conspiracies against the Bourbons, and in 1821 was instrumental in founding the French carbonari society, in imitation of that of Italy. A few weeks after the establishment of this society in France, its members boasted that it numbered 200,000 men. The conspiracy was discovered and crushed, and many of those engaged in it were convicted and punished with imprisonment. The judges disagreeing in the case of Buchez, he was set free, and immediately devoted himself to scientific studies, published a treatise on hygiene, and established in 1827 the *Journal des progrès des sciences et institutions médicales*. He was also a contributor to a weekly periodical, *Le producteur*, which advocated the doctrines of St. Simon. For some time he continued to take part in this publication, although differing in many points from his collaborators; but when the pantheistic direction of the new doctrine became more apparent, he separated himself from the school. After the revolution of 1830, he established *L'Européen*, which dealt with questions of morals and of practical life. In 1838 appeared his *Introduction à la science de l'histoire, ou science du développement de l'humanité*, in which his philosophical views are elaborately presented. In concert with M. Roux he commenced, in the same year, the publication of the *Histoire parlementaire de la révolution française*, in 40 vols. The last and most important of his works, which has, we believe, never been completed, is the *Essai d'un traité complet de philosophie, au point de vue du catholicisme et du progrès*, 8 volumes of which

appeared in 1840. The revolution of February, 1848, threw him again into politics. He became deputy-mayor of Paris under Marrast, was elected member of the national assembly from the department of the Seine, and called to the presidential chair. When the assembly was attacked by a mob, on the 15th of May, he showed much indecision of character. He has since that time returned to private life.

BUCHHORN, KARL LUDWIG BERNHARD CHRISTIAN, a German professor of engraving, born at Halberstadt, April 18, 1770, died in Berlin, Nov. 13, 1856. On March 12, 1811, he was made a member of the Berlin academy, and in 1814 professor and member of the academical senate. In 1824 the direction of the school of engraving devolved upon him. He bequeathed \$7,500 to the Berlin academy, and \$3,000 to that of his native town, the interest of both sums to go toward the support of poor artists.

BÜCHNER, GEORG, a German poet, born in 1813 at Goddelau, near Darmstadt, died in Zurich in 1887. He had studied at Strasbourg and Giessen, and for some time lectured on anatomy at Darmstadt. He was an enthusiast for German liberty, and a member of the secret political societies while at the university. He was implicated in the Frankfort insurrection of 1848, and fled first to Strasbourg, and in 1846 to Zurich, where the university conferred upon him the title of doctor of philosophy. In 1855 he published a play on "Danton's Death." He left a drama, fragments of novels, and other MSS. for publication to his friend Gutzkow. He had also published during his lifetime a comedy of his own composition entitled "Leonce and Lena," and "Lucrezia Borgia," and "Maria Tudor," translated from the French of Victor Hugo.

BUCHWALD, JOHANN HENDRIK, a Danish poet, born at Vienna, Oct. 2, 1787, while his parents were travelling. He was educated in Copenhagen, served in the French army during the wars of the empire and after the restoration, till, in 1823, he was decorated with the cross of the legion of honor. In 1828 he was appointed professor of French literature in the university of Kiel, which he held till the revolution of 1848 obliged him to leave it. He has written several volumes of prose and verse, both in Danish and French, among which are "Souvenirs," the "Poetical Age of a Scandinavian," "Flowers of Kiel," "My Auditory," and the "Young Invalid."

BUOK, the male of some wild animals of chase, and of some domesticated quadrupeds; properly and generally, the male of the fallow deer, *dama vulgaris*, or common park deer of England. The term buck is also applied correctly to males of the roe (*capreolus caprea*) of Europe, of the spotted axis (*axis maxima*) of India, of the antelopes of all species, of the wild and domestic goat, and of the rabbit; improperly, to the male of the American deer (*cervus Virginianus*), of the black-tailed deer (*cervus macrotis*), and of the Mexican deer (*cervus Mexicanus*). The application of the term buck to the

3 species of deer last named, and yet more to the American elk (*Cervus canadensis*), is incorrect, because the true name of the males of these deer which rank as stags or hart, while that of the female is hind. Wherever the word buck is correct of the male, doe is proper of the female. The young of both varieties are indiscriminately known as fawns, though of the young of the hart and hind calf is the true term. The buck of the fallow deer of England is of 2 varieties, the one spotted, which is said to be descended from the spotted axis of India, the other deep brown, which is said to have been introduced from Norway by James I, who was enthusiastically devoted to the chase, especially that of the buck, and in whose reign the royal buckhounds were first kept up as part of the royal establishment. It is remarkable that where fallow and red deer are kept together in the same parks, as is often the case in Great Britain, they never associate in companies, much less are ever known to breed in common, but carefully avoid each other, even so far as to shun the places which either species may have chosen to frequent. The bucks of the fallow deer are much smaller than the harts of the red deer, and are easily distinguished from them by their horns or antlers, which, instead of being round and pointed at the upper extremity, with several forward lines or branches, are round only at the base near the head, having a single pair of brow antlers, and a single pair of anterior points a little higher up the stem, above which the horns spread out into flat palmated surfaces, projecting a little forward at the top, and having several posterior sharp snags or processes. The buck, during his 1st year, is called a fawn; the 2d a pricket; the 3d, a sored; the 4th, a sore; the 5th, a buck of the first head; the 6th, a great buck. The fallow deer breed at two years old, and bring forth 1, 2, or 3 fawns; they come to their maturity at 3 years, and live to about 20. The rutting time of the buck commences about the middle of September, after which he is out of season, his flesh being no longer eatable. He sheds his horns in April or May, and his new ones are fully grown about the end of August. He is in height of season in July. The doe comes into season when the buck goes out, and continues until twelfth-tide. She begins to fawn in May, and continues until midsummer. The bucks breed together, and are far more companionable than the harts, and are exceedingly easy to be tamed, when they become impudently familiar and intimate. The cry of the buck is called braying or grunting, sometimes growling, as that of the hart is termed belling. The fallow deer are kept in England merely as ornaments to park scenery and for supplying venison to the table; never any longer, as of old, for sporting purposes. When wanted for their flesh, a fat one is singled out from the herd, and shot with a rifle by the gamekeeper; for a sportsman would never think of shooting his mutton or beef for amusement, as of killing the domesticated deer as a sport. The venison is infinitely more sa-

culent, tender, and juicy, than that of the red deer, and it is not unusual to find the buck, in high season, with 5 and 4 inches of fat on his brisket. Various pastures produce various degrees of excellence in the venison. Where the wild thyme grows abundantly, the flesh of the deer is noted for its delicious aromatic flavor; and it is remarked that the more level and luxuriantly pastured parks of the south of England produce the fattest venison, while those of the north, abounding in broken ground, plants, and knolls, covered with broom and fern, yield it of the highest flavor.—So late as the reigns of the Stuart monarchs, shooting the fallow deer with the crossbow, cursing it with greyhounds, in the royal parks and chases, and turning it out to hunt with the buckhounds, were royal amusements. The buckhounds are still kept up, and the "master of the buckhounds" is a high, honorable court office, held by some sporting nobleman; but they no longer hunt the buck, the hart or stag of the red deer having been, for many years, substituted for the fallow buck, as being far more amusing, stronger, faster, and capable of supporting longer chases. In many parts of Germany, in Denmark, Norway, and Sweden, the fallow deer runs wild in the forests, and is strictly preserved for the use of royalty and the territorial nobles. It is usually driven with hounds, or beaters, and killed with fowling piece and back-shot. The male of the American deer, improperly called buck, comes into season, generally, in August, and continues until midwinter. He is either killed by what is called still-hunting, without the use of dogs, the hunter depending on his eyesight and wood-craft alone, and standing upon him while feeding, ruminating, or sleeping, when he is shot with the rifle; or by driving him up to persons ambushed at what are known as stands, on the deer-paths, by which he goes to water, who generally use shot guns. In the southern states, he is hunted on horseback, with packs of foxhounds, trained to pursue his scent, which is the sweetest of all to high-level hounds; and in the western states he is sometimes coursed with greyhounds, or the large, shaggy Scottish deerhound.

BÜCKEBURG, a part of the German principality of Schaumburg-Lippe. The town of the same name, with a pop. of 10,000, is well built, has 5 gates, and contains a handsome castle. In its vicinity is the summer palace of Ham.

BUCKEYE. See **HOUSE CHIMNEY**.

BUCKINCK, ANTON, a German engraver on copper, in the 16th century. In company with Swynsbaym, he undertook the printing of the works of Ptolemy with engraved maps (Rome, 1476). He is considered the inventor of the art.

BUCKINGHAM, a county of Virginia, S. E. of the centre of the state, bounded N. and N. W. by the James river, and S. by the Appomattox, was organized in 1761 and named from Buckingham, England. Area, 680 sq. m.; pop. 13,837, of whom 5,161 were slaves, and 750 free colored. The surface is somewhat hilly, and the soil not very rich, except near the

rivers. Tobacco is its great staple. The productions in 1850 were 804,711 bushels of Indian corn, 133,819 of wheat, 117,091 of oats, 2,342,987 pounds of tobacco, and 83,480 of butter. There were 2 corn and flour mills, 8 saw mills, 19 churches, and 194 pupils attending public schools. In the vicinity of Willis mountain, the principal elevation, are gold mines. Iron is found here, and valuable slate quarries have been opened near the Slate river. The James river canal passes along the border of the county. Its real estate valued in 1850 at \$2,103,599; in 1857 at \$2,419,006, showing an increase of 15 per cent. Capital, Maysville.

BUCKINGHAM, a market town, parliamentary and municipal borough, and parish of England, in the county of its own name; pop. of parliamentary borough in 1851, 8,069. It is built on a peninsula formed by the windings of the river Ouse, which is here crossed by 8 bridges. A branch of the grand junction canal runs through it, and a branch of the London and north-western railway gives easy communication with the metropolis, 61 miles N. W. The streets are irregular, but paved, well lighted, and lined with neat brick houses. The chief public buildings are the town hall, the jail, and the large parish church, erected in 1781; there are also various chapels, a free grammar school founded by Edward VI., a green coat and national schools, 2 hospitals, and a workhouse. Buckingham once kept numbers of women employed in lace-making, but this branch of industry is now declining. There are some breweries and tan-yards, and in the vicinity are corn and paper mills and quarries of limestone and marble. The town is very ancient; it was erected into a borough by Henry VIII.

BUCKINGHAM, DUKES OR, English nobles of different families and creations, from an early date to the present day. The title of earl of Buckingham seems, at first, to have been borne by the younger sons of the Plantagenet kings; as we find was the case with the youngest son of Edward III., who was created duke of Gloucester by his nephew, Richard II., and subsequently murdered, by his orders, in the castle at Calais. The title of duke of Buckingham was borne, during the wars of the roses, by the noble family of Stafford, descended from the daughter of the above duke of Gloucester, several members of which fell, either in the field or on the scaffold, in the course of that long and cruel struggle.—In the battle of St. Albans, A. D. 1455, in which was shed the first blood in that domestic quarrel of 30 years' continuance, which required 12 pitched battles before it was brought to a close, cost the lives, as it has been computed, of 80 princes of the blood, and almost entirely annihilated the ancient nobility of England, was slain Humphrey, earl of Stafford, eldest son of Humphrey, duke of Buckingham. Ten years later than this, in the bloody battle of Northampton, fought between that city and Towcester, "in which the king's army was profligate and discomfitted, and of the same

slayn and drowned in the ryver fewe lesse than x thousand talle Englyshmen," was killed Humphrey, duke of Buckingham, fighting on the side of Lancaster, to which party the family had thus far attached itself.—HENRY STAFFORD, the next duke of Buckingham, although son and grandson of 2 noblemen conspicuous for their faith to the house of Lancaster, became a ward of the crown, neither his title nor his fortunes having been attained; and was subsequently married to Catharine, the sister of the beautiful Elizabeth Woodville, Edward's queen. After the death of Edward, his brother George of Clarence and his heirs having been set aside by attainder for high treason, and the appointment of Richard of Gloucester to the protectorate, during the minority of Edward V., we find this Henry, duke of Buckingham, acting as the abettor of Richard, promulgating the statement that, previous to his marriage with Elizabeth, the late king had been secretly married to the lady Eleanor Talbot, without any witnesses, by Stillington, bishop of Bath, who afterward divulged the secret; and that, consequently, his subsequent marriage with Elizabeth was void, and the issue of that marriage spurious. On the strength of this vain pretext, he proclaimed Richard III. at the guildhall, and procuring the acclamations of a certain portion of the audience, packed beforehand for the purpose, tendered the crown to Richard, as the free and spontaneous gift of the people, who were resolved to have a new prince, in lieu of the infant Edward; a gift which, after some affected opposition, the usurper pretended to accept with humility and wonder. Shortly after this, he committed Morton, bishop of Ely, whom he had for some time held prisoner in the tower, to free custody in charge of Buckingham, who, at his friend's coronation, astonished the eyes of all men by the splendor of his own dress and accoutrements, and by the magnificence of his horse's bardings, which were so heavily charged with embroideries and blazonries of burnished gold, that it was necessary to have 4 gentlemen, walking by the side of the horse, to bear up the trappings from the ground. Shortly again, however, whether, as it has been said, he was brought over by the bishop of Ely to the part of the Lancastrians, or whether ambition urged him forward, or resentment against Richard for not having better rewarded his services, he entered into negotiations with Henry, earl of Richmond, and, on being summoned by King Richard to repair to court, knowing his danger, took up arms, and, raising a great power of wild Welshmen, marched into Gloucestershire, with the intent of joining the Cornish men who had set up the earl of Richmond's standard. A rising of the Severn, however, prevented the junction; and his Welshmen having become impatient of delay and inactivity and dispersed themselves, he was obliged to seek safety in disguise. Being, however, betrayed by his servant Bannister, he was apprehended, and, on his own confession, by which he vainly hoped to obtain pardon, was

sundered and beheaded in 1499, on a new scaffold, in the market place at Salisbury.—The next duke, EDWARD BRADFORD, was restored to his rank and dignities, and reinstated in his possessions, as one of the first acts of his reign, by Henry VII. He was a man of great wealth and considerable influence, and made himself very conspicuous by the splendor of his apparel, which is described by Hall as "a gown all of goldsmith's work, very costly," on the occasion of the first entrance of King Henry VIII into London, after his accession to the throne. For some considerable time, Buckingham was in high favor with the court; and perhaps the first thing which affected his favor was the difficulties which he is reported to have made, and the words which he uttered, in reference to the extraordinary expenditures which he was compelled to incur on the occasion of the famous field of the cloth of gold. About this time Buckingham, it appears, gave mortal offence to Cardinal Wolsey, being as proud of his unquestioned blood as the churchman, after his elevation, was forgetful of his ignoble origin. He was once, it is said, in performance of his duty of chamberlain, holding the basin for the king to wash before meat, when the cardinal dipped his hands into the vessel; whereat the proud blood of the Staffords rose so highly, brooking not to be made to play the part of serving man to the son of a butcher, that the duke, by a pretended accident, flung the water into the shoes of the prelate. Wolsey, as it is reported, punished Buckingham that he "would sit on his skirts," frowning revengefully as he used the words; whereupon, in order to show his scorn and his defiance, the proud noble repaired to court, clad in a short jerkin, so as to attract the attention of the king; to whom, on his asking the cause of that singular costume, he replied that "it was to prevent the cardinal from executing his throat, since, if he wore no skirts, they could not be set upon." However true this anecdote may be, and whatever ill influence Wolsey may have exerted against him, there were other natural causes which weighed heavily with Henry. Buckingham was descended from Edward III., both through John of Gaunt, duke of Lancaster, and Anne Plantagenet, daughter of Thomas of Woodstock, earl of Buckingham and duke of Gloucester; to which latter line of descent he owed his own title. He was not, however, a very near kinsman of Henry's; nor was his chance of succession, at the best, more than remote; yet the Tudors were hereditarily jealous of all who could, through consanguinity, ever, by any chance, be in a position to dispute the succession; and many nobles of the family of Plantagenet had already fallen, and more were yet to fall, for no crime but that of their blood. Buckingham had, it appears, been thoughtless and foolish, if not worse; he had consulted one Hopkins, who had obtained some celebrity about that time as a wizard, concerning his chances of a royal succession; and had made use of wild and threatening language,

which might well have given umbrage to a less jealous prince than his master. He was accordingly brought to trial, the duke of Norfolk, whose son, the earl of Surrey, had married Buckingham's daughter, being the president of the court; and after a trial, the witnesses being confronted with the accused and regularly examined, was found guilty of high treason, and publicly executed on Tower Hill, in the 18th year of King Henry VIII. With him ended the ducal title in the house of Stafford; and unfortunately no that family had been, yet more so was that of Villiers, which, after 4 reigns, succeeded to its dignities, since it failed, not alone in fortune, but in character and honor.—During the remainder of the reign of Henry VIII, and those of his immediate successors, Edward VI., James Grey, Mary, and Elizabeth, there was no independence of Buckingham; but, in 1615, the 9th year of James Stuart of Scotland, in whose court every thing was new, from the tenure of office, the chastity of women, the honor of men, to the ermine of the judges, the place of cap-bearer was bought for GISSON VILLIERS, a younger son of Sir Edward Villiers, of Brooksbury in Leicestershire, born Aug. 20, 1592, died Aug. 24, 1626. He had a fine person, a handsome face, a ready wit, a fluent tongue, manners of the most approved French finish, a power of conciliating and winning where he chose to do so, and an audacity of insolence and of ambition, which overbore all opposition, and won its way, where merit halted inefficient and in vain. Beyond this he had nothing; his talent was of the most mediocre order, and he seems to have lacked alike the capacity and inclination for eminent crime, or for the pursuit of virtue. To the desire of some of the leading nobles, Pembroke, Hertford, Bedford, and others, to displace and overthrow the lawless and infamous rascal of the English, or rather Scottish, Otho, is to be ascribed the rise of this worthless man. Anne of Denmark was with difficulty induced to accede to the scheme of advancing George Villiers with the king, in order to subvert Robert Carr, earl of Somerset; as, it seems, she had formed a clearer and truer estimate of the young man's character than any of the others. "My lord," she said to Archbishop Abbott, who was employed to gain her cooperation in the plan, "you know not what you desire. If Villiers gain the royal favor, we shall all be sufferers. I shall not be spared more than the others. The king will teach him to treat us all with pride and contempt." And so it fell out; for the scheme was pushed successfully, without regard to the queen's advice. On St. George's feast, he was made gentleman of the privy chamber, and the next day was knighted. Only 3 years later, the new favorite ventured to try his power against that of the celebrated Bacon, who had presumed to take part against him in an unseemly transaction regarding the forced marriage of the daughter of Coke with Sir John Villiers, Buckingham's brother. But Bacon, soon finding himself unable to contend against

the new influence, succumbed, and was rewarded by his appointment as lord chancellor, and his creation as baron of Verulam. From that day forth, George Villiers became, to all intents and purposes, the king of England. He was already baron, viscount, earl and marquis of Buckingham, privy councillor, knight of the garter, master of the horse, and lord high admiral of England. The distribution of peerages, offices, church preferments, the direction of the courts of law, the control of all departments of government, were his alone; and, by the sale of every thing previously held sacred, as also by possessing monopolies of most articles in daily use, he was able to make his wealth grow *pari passu* with his power. Year after year, his power and influence continued to increase; until, in 1628, he went off in company with Prince Charles, afterward the unfortunate Charles I., to Madrid, with the secret connivance of the king, to bring about a marriage between the heir of the English throne and the Spanish infanta. Buckingham's intolerable arrogance, however, broke off the match, which was exceedingly distasteful to the people of England, as it was understood, not probably without some shadow of reason, that the marriage would be accompanied, or preceded, by the conversion of the prince to the Roman Catholic religion. Buckingham, who was created duke during his absence in Spain, seems to have been actuated only by a desire of mortifying and disgracing the earl of Bristol, who was English minister at Madrid, and of wantonly displaying his authority. The worst feature of the whole matter was its ruinous effect on the character of the prince of Wales; who here received lessons, which he never unlearned, of simulation and dissimulation. For a time, owing to his conduct in relation to the Spanish marriage, Buckingham fell into suspicion if not into disgrace with the old king, who had not, however, the courage to resist the impetuous arrogance of his favorite, or the calm and serene obstinacy of his son; but the popularity which the favorite gained with the people, and with what was known as the country party, together with the influence he had acquired over the weak yet stubborn character of the prince, more than recompensed him for the loss of the dying king's affections. His last act, in the reign of James, was to negotiate an alliance with Henriette Marie, the daughter of Henry IV. of France; but James was already dead before the treaty could be ratified, though his death did not prevent the celebration and consummation of the marriage, almost before his body was cold in the grave. Over Charles I. continued the dominion of Buckingham, in a form even more obnoxious than that which he had exercised over the father; and as he governed the king, so was he governed by his favorite, the earl of Holland. He made alliances with foreign powers, and broke them, at his own pleasure; involved England in war with both France and Spain, the 3 Catholic countries, which it had been the lifelong dream of King

James to conciliate at all hazards; and would have been impeached by the house of commons, in 1626, when the king appointed him chancellor of the university of Cambridge, in order to manifest his contempt of parliament, and dissolved the parliament in order to prevent its further action against his favorite. After this, Buckingham instigated and commanded an expedition against the isles of Ré and Oléron, which terminated in the disgrace of the British arms, in the loss of 1,200 soldiers and 20 stand of colors. Buckingham was the last to retreat. Notwithstanding the notorious incapacity of the man, and the emphatic enunciation of the house of commons, "that Buckingham was the cause of all the national calamities," Charles named the favorite commander-in-chief of the new expedition to be sent for the relief of the Protestants of La Rochelle. On the same day which was marked by the denunciation of the house of commons, Buckingham's physician, Dr. Lamb, was murdered in the street by a London mob; on the next the metropolis was thus placarded: "Who rules the kingdom? The king! Who rules the king? The duke! Who rules the duke? The devil! Let the duke look to it, or he will be served as his doctor was served!" He had too much courage to regard the menace; yet the menace, whether it had any connection with the event or no, was accomplished; for one John Felton, a lieutenant in the army, who had been unjustly superseded and deprived of his arrears of pay, stabbed him mortally in Portsmouth, a few hours before the intended sailing of the expedition. The assassin, who was a religious fanatic as well as a discontented soldier, pleaded guilty to the commission of the crime, confessed his delusion, expressed contrition, and died penitent and composed.—GEORGE VILLIERS, second duke and son of the preceding, born Jan. 30, 1627, died April 7, 1688. He was superior to his father in ability, in profligacy, and in the depth and ignominy of his fall. But, although he occupied himself, more or less, in government intrigues and cabals, they were rather connected with personal squabbles and small party conspiracies, entered into for individual purposes and objects, than with any affairs of national and general interest. Indeed, with the exception of a few intestine affairs, especially that concerning the succession of the duke of York, there was no question that can be said to have been of national or general interest during the frivolous period of Charles II. He was educated at Trinity college, Cambridge, was abroad at the breaking out of the civil war, but returned shortly afterward, and served the king under Prince Rupert and the lord Gerard. At the death of Charles I., his estates were confiscated; he sought in vain to obtain their restoration at the hands of parliament, and travelled abroad until 1648, when he returned with Charles II.; was present with him in the disastrous battles of Dunbar and Worcester; and, on the failure of the attempt, followed the princes to the continent, and served as a

volunteer in the French armies, under Turenne. He found means, however, again to reconcile himself to the powers that were, and, again returning to England, married the daughter of the Presbyterian Lord Fairfax, to whom his estates had been assigned by parliament on the defeat of the royal cause. The want of principle, however, which he had displayed, did not affect him injuriously with Charles II., who, immediately on his restoration, appointed him master of the horse. He was one of that corrupt party of confidential mistresses, who were designated as the *cabal*, a word formed, after the manner of an acrostic, out of the initials of their names; but, throughout the reign, he was distinguished only for political dishonesty and social profligacy. On more occasions than one, he was in secret correspondence with the enemies of the court; and was, it can scarcely be doubted, guilty at least of misprision of treason, if not of plotting the destruction and, perhaps, the death of the king. He set up Mowmouth against the duke of York; it is almost certain that he was, more or less, privy to the Rye-house plot; and he certainly, in the last instance, plotted with the dissenters, the Anabaptists and fifth monarchist men, together with Staffordbury, for the overthrow of the government. His private life was a series of base broils, shameful intrigues, and mingled adventures of cowardice, impudence, and audacity. He was challenged by Osborn, but contrived to mistake the appointed time and place. He killed Lord Shrewsbury, whose wife he had seduced, in a duel—the profligate woman, disguised in a page's dress, holding the horse of her paramour in order to witness the bloody scene; and then, carrying his abandoned mistress to his own home, sent his own injured wife home to her father. He instigated the notorious Col. Blood to kidnap the venerable duke of Ormond and hang him at Tyburn, in which he almost succeeded. At last, he fell into utter contempt, which no man ever more justly merited, with all parties; was banished from court; ordered into the country, which he hated; stripped of all his employments; deserted by all his infamous associates; and at length died, poor, neglected, and unregretted, at Kirkby Moorside, in Yorkshire. He was not without abilities; he displayed some literary talents, and left a passable comedy, the "Rehearsal;" but his accomplishments and attainments were all mostly superficial; as his only ambition seems to have been to gratify the caprice of the moment, and shine, for that single point of time, predominant in whatever was the whim of the world for the present minute. The title of Buckingham has since passed into the family of the Chandos Temples, which has produced no person of note.

BUCKINGHAM, JAMES SMY, an English traveller and author, born at Finsbury, near Falmouth, in 1784, died in London, June 29, 1855. While yet a child he lost his father, who had been a seaman, but then occupied a small farm. He went to school at Falmouth,

and was intended for the church, but preferred going to sea, made a few voyages to and from Lisbon, was taken prisoner by the French, and, on his returning home, went into service with a bookseller at Dorchester, continuing there 4 years. He again attempted the sea; deserted from a king's ship; tried the law for a short time; married before he was 20; succeeded to some property on his mother's death, which he lost by the dishonesty of a trustee; set up as a bookseller, on borrowed capital; became bankrupt; left his destitute wife and child in care of her friends; obtained employment in a London printing office, and eventually at the Clarendon press, Oxford; next was captain of a West India man for some years, and afterward had charge of a ship in the Mediterranean trade. In April, 1812, he sailed for Malta, where he had made many friends, with a cargo of his own; but on reaching his destination, the plague had broken out there and he was not allowed to land. His cargo was put on shore, he went on to Smyrna, and soon learned that by some commercial failures at Malta he had lost all his property there. He now went to Egypt, offered his services to the pasha for the purpose of examining the best site for a canal across the isthmus of Suez; was robbed; returned to Cairo almost naked, and was again despatched on an expedition. He reached Suez, traced the course of the ancient canal, and having duly reported the results, was informed that the pasha had changed his mind, but wished him to purchase ships for him in India, and establish a trade between that country and Egypt. Mr. Buckingham reached Bombay in April, 1815, found it difficult to inspire the merchants with confidence in the pasha, and accepted the command of a large ship belonging to the imam of Muscat, which was to trade to China on account of that prince. But not having the East India company's license (without which, at that time, no Englishman could reside in India), he was ordered out of the country, and returned to Egypt, where the pasha granted him money, and a firman, which enabled him to travel overland to India, through Syria, Mesopotamia, and Persia, dressed as an Egyptian mamluke. He reached Calcutta in 1818, in command of the imam's frigate; but being ordered to proceed to Africa to give convoy to several vessels engaged in procuring slaves, as well as to take some on board his own ship, he threw up his command. He so much interested the merchants of Hastings, then governor-general of India, that he obtained leave to reside there; established a daily paper, called the "Calcutta Journal;" offended the authorities by the freedom of his animadversions on public affairs; was indicted, tried, and acquitted; and finally was sent home, and his press seized. Thus was confiscated an income of £5,000 a year, and a property valued at £100,000. He returned to England in 1822, and commenced a London evening paper, which did not succeed, and the "Oriental Herald," a political and literary review, almost exclusively

devoted to East India affairs, which did. He published, in numerous volumes, his travels in Palestine, among the Arab tribes, in Mesopotamia, and in Syria and Media. He established the "Sphinx," a weekly newspaper, in July, 1827, and, about the same time, the "Athenæum," a literary journal, which passed successively into the hands of the late John Sterling and C. W. Dilke; the "Sphinx" eventually was merged in the "Spectator." He threw himself with great energy into the arena, some time before the renewal of the East India company's charter in 1833, delivering lectures on British India, all over the united kingdom, against the company's commercial monopoly, and subsequently lecturing against impressment of seamen, intemperance, the corn laws, and on other subjects of public interest. He found time for European travel, and published his tours in Belgium, Switzerland, Germany, France, and Piedmont. He joined very warmly in the popular agitation of the reform bill, and the inhabitants of Sheffield (raised into an electoral borough by that measure) returned him as their first member. He retained his seat in parliament until 1837, when he was defeated on a close contest. Soon after he retired into private life, he visited America, on a lecturing tour, freely expressing his opinions on the temperance and anti-slavery questions. Nine octavo volumes contain his travels in America, viz.: 3 on the northern states, 2 on the slave states, 3 on the eastern states, and 1 on British North America. They contain little that had not been told by previous tourists, and their author's own opinions are diffusely expressed. On his return to England he resumed his lectures, which were generally well attended. In 1843 he established a club, called the "British and Foreign Institute," which was opened with great state by Prince Albert, and had considerable success for some time, with Mr. Buckingham as its manager. The enmity of a leading writer in "Punch" was accidentally excited, and the "Institute" was literally written down, after 3 years' existence, by that lively satirist. In 1849 Mr. B. published a volume on "National Evils and Practical Remedies." In 1851 he became president of the London "Temperance League." In 1855 he published the first 2 volumes of his "Autobiography," but died in that year, before the 2 concluding volumes could appear. His latter years were passed in tranquil competence, for the East India company, with tardy justice, had granted him a pension of £300 a year, and he also had a literary pension of £200 a year from the crown.—Mr. Buckingham's private character was stainless. He possessed considerable abilities; was a graceful, fluent, and sometimes even eloquent speaker; was undoubtedly sincere; had travelled and observed much; and possessed considerable knowledge of men and things, but as a public man, his influence was limited.

BUCKINGHAM, JOSEPH TINKER, a prominent journalist of New England, is the son of

Nehemiah Tinker, of Windham, Conn., where he was born Dec. 21, 1779. His father exhausted his whole property in supporting the American army during the revolution, and died March 17, 1788, leaving a family without any means of support. Under these circumstances they became so reduced that they were obliged to appeal to the town officials for assistance, and were supported by them for a winter, when they removed to Worthington, Mass. Here Joseph was apprenticed to a farmer, with whom he remained for several years. While in this family he showed some desire for knowledge, and made himself acquainted with the rudiments of an English education. At the age of 16 he entered the printing office of David Carlisle, of Walpole, N. H., who combined with his printing business the publication of the "Farmer's Museum." Here young Buckingham first became acquainted with the elements of the profession in which he was afterward to gain distinction. After remaining a few months with Carlisle, he entered the office of the "Greenfield Gazette;" where he remained until 1800, when he removed to Boston. In 1808 he performed the duties of prompter for a short time in a company of comedians, who played during the summer months in Providence and Salem. In 1806, having changed his name, by application to the legislature, from Tinker to Buckingham, which was his mother's family name, he commenced life for himself by the publication of the "Polyanthus," a monthly magazine, which, after an existence of a year, was discontinued and not resumed until 1812. In 1809 Mr. Buckingham published for six months the "Ordeal," a weekly magazine. In 1817, in company with Samuel L. Knapp, he commenced the publication of the "New England Galaxy and Masonic Magazine," which continued in his possession until 1828, when he sold it. In 1831, in connection with his son, he commenced the publication of the "New England Magazine," which was continued under his care until 1834, and contained contributions from numerous writers who have since attained great literary eminence. In 1824 he published the first number of the "Boston Courier," a paper which he continued to edit until June, 1848. Mr. Buckingham was several times elected to the legislature, and, in 1847-'48, and 1850-'51, to the senate of Massachusetts. He has also published, "Specimens of Newspaper Literature, with Personal Memoirs, Anecdotes and Reminiscences," 2 vols., Boston, 1852; and "Personal Memoirs and Recollections of Editorial Life," 2 vols., Boston. His present residence is in Cambridge, Mass.

BUCKINGHAMSHIRE, or Bucks, an inland county of England, bounded N. by Northamptonshire, E. by Bedfordshire, Hertfordshire, and Middlesex, W. by Oxfordshire, and separated from Berkshire on the S. by the river Thames. Area, 464,980 acres, of which 440,000 are said to be arable and pasture land; pop. in 1851, 163,554. It was originally a purely Saxon county, and is said to derive its name from the

word *Duckenoin*, the home or country of the beech trees, which are still common throughout the county. The surface is pleasantly diversified, the N. parts being undulating, the middle occupied by the fertile vale of Aylesbury, and the S. traversed by the Chiltern hills. The principal rivers are the Thames, Thame, Ouse, and Colne. The most important productions are butter, cattle, lambs, poultry, &c., which are carried to the London market. The Aylesbury sheep are famous for the weight and excellent quality of their fleeces. Buckingham, Aylesbury, Marlow, and Wycombe are the chief towns. The north-western and great western railways, and the grand junction canal, pass through the county, and send off branches to several of its towns. It gives the title of earl to the family of Hohart.

BUCKLAND, OYROS, master machinist in the U. S. armory at Springfield, born at Manchester, Conn., Aug. 10, 1799, spent his boyhood and youth upon his father's farm, in the duties of which he assisted, receiving such rudiments of education only as were then taught in the common schools of his native state. At the age of 20 he commenced his career in the wheelwright shop of his brother. In 1822 he entered the employ of the Mason and Hinckley manufacturing company, at Monson, Mass., and afterward of the Boston and Springfield manufacturing company, at Chispeep Falls, Mass. At the latter place he was employed from 1824 to 1829, making patterns, drafting, and in various ways assisting in the building of the machinery used in the manufacture of cotton fabrics. In 1829 he accepted from Col. Lee, then superintendent of the Springfield armory, an invitation to enter the service of the United States. He began his labors at the armory as pattern maker, in which province he had no superior, advancing from that position to that of designer of machinery and tools for the manufacture of arms. By systematic study, he made himself familiar with the construction of every part of the arm, and thus laid the foundation of his future usefulness and success. At different periods he has occupied the post of inspector in all the different departments of the armory. He has also been employed by the ordnance department as an inspector of cannon. His skill and judgment in the construction of arms soon becoming apparent, he was intrusted with the duty of improving and remodeling old weapons and contriving new ones, for the U. S. service. About the year 1842, a desire was manifested by the government for the introduction of labor-saving machines into the armories, and his inventive genius was called into action. He has produced a set of "stocking" machinery, comprising 14 machines for working the gun-stock, from the rough state in which it comes to the armory, to almost a finish. Among the more important of these are the following: 1, a machine for bedding the barrel, or cutting the grooves in the stock to re-

ceive the barrel; this machine performs its work perfectly in one minute's time; 2, a machine for profiling the stock; 3, a machine for cutting on the butt-plate, and boring and tapping for the screws of the same; 4, a machine for cutting on the 8 bands which bind together the stock and barrel, at one operation; 5, a machine for cutting off the surplus wood between the bands; 6, a machine for second or finish-turning the stock; 7, a machine for cutting the bed in the stock, to receive the lock—a beautiful piece of work, and original in construction; 8, a machine for cutting the bed for the guard, with mortise, screw-holes, &c.; 9, a finishing machine for cutting in the hand-springs, having for hand-spring and ramrod spring wires, grooving for ramrod, &c. Of this whole set of machines, 3 of them only retain the leading principle of their original inventor, Mr. Thomas Blanchard. By the help of this machinery the gun-stock is completed from the rough in about an hour, occupying about 23 minutes in passing through the machines, and about 37 minutes of hand labor in finishing and smoothing. A military commission was sent to this country by the British government to examine the national armories, and the mode of manufacturing arms by machinery. This examination resulted in an order from the British government for a duplicate set of the stocking machines, which are now at work in the English manufactory of arms at Enfield, near London. This was followed by an order from the Russian government for another set of the same machines, and a third from the London armory company, a private establishment.—Among other inventions and improvements of Mr. Buckland's may be mentioned machines for the following operations: for turning the upper band of the musket, a very irregular and eccentric piece; for punching, cutting, and trimming various parts of the arms; for finishing the cone; for milling screws; for finish-milling and tapping the cone seat; for checking the comb of the hammer; for first-boring the barrel; for turning the barrel; for milling the edges of the lock-plate. Two other machines, being the most recent inventions of Mr. Buckland, deserve a more particular notice. One of these is for rifling or cutting the grooves in the barrel of the new model rifle-musket. Of these grooves there are 3 of equal width, and equal also in width to the spaces between them. These grooves are very shallow, being only .015 of an inch in depth at the breach of the barrel, and regularly diminishing in depth to .005 of an inch at the muzzle. This regular diminution in depth was the difficulty to be accomplished. Buckland's rifling machine cuts the 3 grooves at once, and so perfectly as to leave them without the slightest burr, scratch, or defect of any kind, of a fine and brilliant polish, and enabling one man to rifle from 50 to 60 barrels per day, against the 8 or 10 which were all that could be accomplished by the old method, and dispensing entirely with the after draw-polishing to which

the grooves made by the old mode, and indeed by all other machines so far as is known, have to be submitted. The last invention of Mr. Buckland is one of his greatest and most useful—a machine for cutting the thread of the screw on the inside of the barrel and for milling the breech-screw, so as to produce a perfect interchange, every screw fitting any barrel to which it may be applied. To accomplish this has until recently been regarded as almost a mechanical impossibility, and was so pronounced by Mr. B. himself a few years ago. Within the year 1857, however, he produced at the first trial a very beautiful machine which does its work with a surprising degree of perfection. Mr. Buckland has never received from the government any other compensation than per diem wages.

BUCKLAND, WILLIAM, D. D., dean of Westminster, an English geologist, born at Axminster, Devonshire, in 1784, died Aug. 14, 1856. From Winchester college, he went in 1801 to Oxford university, and in 1808 was elected fellow of Corpus Christi college. In 1813 he was appointed reader in mineralogy, and in 1818 reader in geology. In this double capacity he greatly advanced practical scientific knowledge in the university. The singular clearness, graphic force, and full information of his lectures made the study of geology very popular. He may be said to have founded the geological museum in Oxford, sparing neither time, travel, nor expense, to supply it with specimens, which he classified, arranged, and described. This collection is more particularly rich in the remains of the larger fossil mammalia, and other animals from the caves in different parts of England and Germany. As early as 1813 he commenced writing on his favorite subject, communicating to the transactions of the geological society his "Descriptive Notes" of 50 miles of a coast survey of Ireland, which he had made in company with the Rev. W. Conybeare, dean of Llandaff. In 1820 he delivered a lecture before the university, which was published as "*Vindiciae Geologicae, or the Connexion of Geology with Religion explained.*" The object was to show that science was not at variance with the Mosaic accounts of the creation and deluge. In 1823 he published *Reliquia Diluviana*, being the expansion of a paper he had communicated to the royal society (of which he was elected member in 1813), respecting the fossil remains of the elephant, hippopotamus, tiger, bear, hyena, and sixteen other animals, discovered in a cave at Kirkdale, Yorkshire, in 1821, for which paper the society voted him the Copley medal, the highest honor in their gift. His theory, put forth in this work, and not very well received by the scientific world, was, that beasts of prey which have long ceased to exist in Europe had resorted to the oolite caves of Yorkshire, previous to the deluge; had dragged into these retreats, for food, such animals as then frequented the neighborhood; had been overtaken in these caves by the

deluge; and that the discovered bones were the remains of themselves and their prey. In 1825 Mr. Buckland married Miss Mary Morland, of Abington, received the lucrative appointment of canon of Christ church, and took the degree of doctor of divinity. In 1837 appeared his Bridgewater treatise on "Geology and Mineralogy," which has always been the most popular of the series. He bestowed such unusual pains upon this work, that it was repeatedly rewritten before it went into the compositors' hands; it was recopied as many as seventeen times; and the manuscript which finally was prepared for the press was the fourth copy which Mrs. Buckland had made with her own hands. Dr. Buckland's own chirography was so singularly feeble, straggling, and indistinct, as to be almost illegible. This was his last and greatest work, but he contributed several valuable papers to the transactions of the geological society, including his two anniversary addresses as president, and his description of the south-western coal district of England. From its formation, he identified himself with the British association for the advancement of science. He was on habits of intimacy and correspondence with most of the scientific men of his time, and with many of the leading public characters of England and the continent. In 1845, when the deanery of Westminster became vacant, by the elevation of Dr. Samuel Wilberforce to the see of Oxford, he succeeded him as dean of Westminster, on the nomination of Sir Robert Peel, with whom he was on the most friendly terms. On accepting this, he relinquished his canonry at Oxford, but continued professor of geology and mineralogy. Removing to London, his first step was to secure public admission to Westminster abbey without the fees which the dean and chapter had previously received; he was appointed trustee of the British museum, where his practical good sense was found valuable; he actively employed himself in advancing the sanitary movements in London; and he was mainly instrumental in procuring the establishment of the national museum of practical geology in London. In 1850 his career of activity and usefulness was arrested. His mind sank under the pressure of its multifarious labors, and insanity (though in its gentlest form) rendered his retirement necessary. In Islip, near Oxford (a college living which he long had held), he found a retreat, and was there attended, during the last 6 years of his life, by the untiring and affectionate care of his wife. Dr. Buckland published several sermons, preached on various occasions, all of them distinguished rather by good sense than scholastic divinity. In manners, he was simple and social. His appearance was that of a country gentleman.—FRANCIS BUCKLAND, his eldest son, is author of a volume of zoological researches, published in 1857.

BUCKLE, HENRY THOMAS, an English scholar, born at Lee, Nov. 24, 1822. His father was a wealthy merchant, and Mr. Buckle enjoyed

not only the advantages of an excellent education in Dr. James Thomas Holloway's school at Gordon house, Kenilch Town, but also of having at his command an excellent and extensive library in his father's house. After leaving Dr. Holloway's school, he entered the paternal counting house, but instead of giving his attention to business, he devoted it to chess, and exhibited so much aptitude for this game that he gained the reputation of being one of the first players of England, if not of the world. His father dying in 1840, leaving him an ample fortune, he was enabled to indulge his taste for books, and devoted himself henceforward exclusively to literary pursuits, for which he was by his secluded and studious habits better qualified than for more active occupations. The 1st part of a work which has gained for him a considerable reputation appeared in 1857, entitled "History of Civilization in England," and is occupied exclusively by only a part of the introduction. It has been received with much favor by the most intelligent minds in England and in the United States, and created a desire for seeing the future volumes of the work, in which the author pledges himself to show that "the progress which Europe has made from barbarism to civilization is entirely due to its intellectual activity." Since the issue of this 1st part, Mr. Buckle has delivered a brilliant lecture on woman, at the royal institution, which has attracted much attention. Mr. Buckle's general place of residence is in Oxford terrace, London. He lives with his mother, in the utmost retirement, spending his days and nights among books. He excels as a whist player not less than as a chess player; but he leads the life of a recluse, and his mind seems concentrated upon his historical work.

BUCKLER, JOSEPH, otherwise known as SCHEIDMANNING, and JEAN L'ÉCONOMER, a famous chief of brigands, born at Naststien, in the duchy of Nassau, in 1779, guillotined at Mentz, Nov. 21, 1809. The son of poor parents, he had already distinguished himself by juvenile robberies, when he entered the service of the executioner of Burenbach. Being dogged for stealing cattle from his master, he ran away and adopted the profession of sheep-stealer. He was detected and imprisoned, effected his escape, and joined the *chouffeurs*, a band of robbers which, during the period of the French revolution, spread terror along both banks of the Rhine. Under the leadership of Rothbart, or the Red-Bearded, he was twice captured, and the audacity and address with which he made his escape from the prisons of Saarbrück and Simmern, in which he had been confined, gave him great celebrity. He next united with the banditti of Peter the Black. At length he was elected captain of a troupe which declared war especially against the Jews, and became the terror of the whole region of the Rhine. The wealthy farmers used to purchase from him, at high prices, passports which would enable them to traverse the country undisturbed.

He was taken prisoner again in 1799, but his escape was immediately accomplished, and with more vigor than before went travellers, returning from their annual markets, plundered by his band. He was tenderly beloved by Julius Blasia, of Dudenweiler, and a poem which he composed in his prison was a favorite song at fairs and religious festivals. His men, with their faces covered with black, made expeditions against the principal proprietors, and broke their furniture piece-meal till their extortioners were granted. The vigorous police organization of Napoleon drove these robbers from the French bank of the Rhine. They were forced to penetrate into Germany, and after protracted efforts by civil officers, Dückler with his comrades was at length arrested by the bailiff of Limburg. He was taken successively to Frankfort and to Mentz, where he was condemned and executed, displaying an unflinching intrepidity. He confessed his crimes; but as he had not committed murder nor robbed the poor, and had always displayed a romantic generosity, a pardon was to the last expected for him. During the period of his greatest power, he often rendered aid to the poor, and relieved in person the sufferings which were caused by his subordinates. His life was written by Sevalinges, in 2 vols., Paris, 1810.

BUCKMINSTER, JOSEPH, D. D., an American clergyman, born at Rutland, Mass., Oct. 3, 1781, died at Beelshorough, near Bennington, Vt., June 12, 1812. By early association and hereditary bias, he was destined for the clerical profession. In boyhood he showed unusual activity and ardor, both in athletic sports and mental pursuits, and at the age of 18 entered Yale college. He was known in college for the kindness and gravity of his character, and because an excellent Latin scholar, mastering the standard Roman authors so thoroughly, that he was able through life to make the happiest quotations from them. Upon attaining his bachelor's degree, he received, as one of the 3 best scholars, the free enjoyment of an added 3 years at the institution, upon the funds of the Berkeley scholarship, and "from a high spirituality of feeling," assiduously devoted this period to theological studies. Among his fellow-students at Yale and life-long friends were those whose names earliest appear in the brief roll of American authors—Barlow, Trumbull, and Dwight. When the period of his scholarship terminated he became a tutor in the college, and fulfilled the duties of that office for 4 years; thus passing 11 years of his life among the halls and walks of his alma mater. During his residence there he passed through a great moral crisis, the result of his sensitive temperament and profound religious inquiries, and after experiencing much depression and mental conflict, and seeking light from a prayerful investigation of the Scriptures, he was cooled conscientiously to define his position as a religious believer, and, in a firm of self-consecration harmonizing with the belief of the New England Calvinists, to devote himself to

the work of the ministry. In 1779 he was ordained pastor of the North church of Portsmouth, N. H., whence his 2 predecessors had been called respectively to the presidencies of Yale and Harvard colleges. The friendship of a remarkably gifted and cordial fraternity of clergymen, the liberal disposition of his people, their comparative prosperity and fine social culture, rendered his position as agreeable as it was influential. He soon after married Sarah Stevens, the carefully educated daughter of the Rev. Dr. Stevens, of Kittery Point. The period of his ministry has been called a great transition era in New England history, both civil and ecclesiastic. While there were yet few newspapers, the clergy were the oracles of the scattered communities upon all subjects of public interest, and were expected to preach upon important political events. Dr. Buckminster cherished an intense admiration of the leaders of the federal party, which so far tintured his occasional homilies as sometimes, and particularly in one instance, to call forth animadversions from those of a different political creed. With this exception, his clerical course was singularly calm and prosperous. He was especially remarkable for the fervor of his devotional exercises, and the general effect of his preaching was to produce emotion rather than conviction. Among the memorable traits and incidents of his life and character, were his simple tastes and habits, his favorite exercise in the garden in summer and in wood-chopping in winter, his careful preparation of sermons, his attention to the aged and poor, his consolations of the distressed, his love of sacred music, in which he excelled, his paternal care and sympathy at home, and his vivid interest in the controversy which, during his later years, made so wide a division between the conservative and liberal Congregationalists. The change of views arrived at and maintained by his idolized and gifted son, Joseph Stevens Buckminster, the discussions between the two, and the struggle between love and duty, self-respect and independence of mind, so obvious throughout, form one of the most interesting features in the memoirs of both. Although differing in creed, and conscientiously tenacious of his own opinions, he preached his son's ordination sermon. When the latter died in the morning of his days, the prophetic heart of the dying parent realized the event before the news arrived, and he himself expired a short time after his son's decease. From the time of the death of his first wife, followed as it was by the bereavement of another wife and of many children, Dr. Buckminster suffered from occasional liability to nervous depression; yet the stringent duties of his profession, his vigorous maturity of mind and body, the society and sympathy of his accomplished son and daughters, were rare ameliorations to the sorrows of his life. He died while on a journey for his health. One of his daughters has published an interesting biography of her father and brother: "Memoirs of the

Rev. Joseph Buckminster, D. D., and of his son, the Rev. Joseph Stevens Buckminster," by Eliza Buckminster Lee, Boston, 1861.—**JOSEPH STEVENS**, eldest son of the preceding, an American clergyman, born at Portsmouth, N. H., May 26, 1784, died in Boston, Mass., June 9, 1812. Few men, whose professional career was so brief, have left so permanent and endeared a memory. As a child his personal beauty, elastic temperament, instinctively religious spirit, love of knowledge, and great aptitude in its acquisition, made him the idol of his home and neighborhood. His first instruction was parental, and from the parsonage he went, in his 11th year, to Exeter academy, where he was soon distinguished as a scholar, and for moral excellence and personal fascination. The letters addressed to him by his father at this time, offer a singular illustration of the economies, strict morals, and minute supervision then characteristic of domestic training in New England. Beside the prescribed course at Exeter, he read with avidity the standard English works in general literature. Entering Harvard college in 1797, he maintained his reputation for scholarship, was admired for his thoughtfulness and mirth, the graces of his manner and the winning kindness of his disposition, became the favorite orator of the clubs and reasoner of the debating societies, and "as a belles-lettres scholar," says one of his classmates, "he was unequalled." He received the honor of the English oration on graduating, and the fragments preserved of this juvenile performance amply justify the traditional charm of his mind and expression. As assistant in Exeter academy, after leaving college, he was one of the teachers of Daniel Webster. At this time he pursued a wide range of general reading, and after beginning his preparation for the ministry, left the academy to reside with a relative in summer at Waltham, and in winter in Boston, while pursuing his theological studies. After he had preached his first sermon, he was invited to supply the pulpit of the Brattle-street church in Boston, and in 1804 that society unanimously elected him their pastor. He wanted a few months of 21 years of age when he thus became the minister of one of the largest and most intelligent religious societies in New England. He at once rose to the level of the highest expectations of his friends; his church became a shrine for the lovers of pure and devout eloquence, and his parsonage the favorite resort of the most intellectual society of Boston. The social graces of the man were indissolubly blended with the sacred gifts of the pulpit orator, and the geniality and warmth of his manners, and the knowledge and wit which marked his conversation, made his home delightful to his friends in the intervals of severe professional duties. Although the charms of his voice and the expressiveness of his countenance and gestures greatly enhanced the immediate effect of his discourse, yet those of his sermons which were collected and published after his decease are

renowned for purity of thought and finish of style, and in some instances unto the best traits of the palmy days of French pulpit eloquence to those of the standard old English divines. The claims on his strength, so faithfully met, caused a failure of health, which indeed led him to seek rest and a change of air and scene in a voyage to Europe. In England he enjoyed the companionship of Dr. Hoes, Granville Sharp, Wilberforce, and especially of Dr. Taylor of Norwich, and Gilbert Wakefield; in Switzerland he met Benjamin Constant, Madame de Staël, and Count Rumford; and visited the scene of the then recent destructive avalanche which overwhelmed Gollau, of which he wrote an admirable description. He resided several months in Paris, and his letters, written during the whole period of his European travels, indicate a strong sympathy with literature and its associations; indeed, the scholar and man of elegant tastes were always consistent in him with the divine. While in England he purchased many works for the Boston Athenæum, and on his return was an active member of the Anthology club, famous in the literary annals of that metropolis for the many gifted men which it included, and for having given birth in one of the first American purely literary periodicals. His love of literature and high estimate of its moral and social function were eloquently manifested in an oration which he delivered before the Phi Beta Kappa society of Harvard university, in 1809, on the "Dangers and Duties of Men of Letters." At the period of his last illness, he was deeply engaged in German studies, then just beginning to attract the attention of theologians in this country. In 1804 he superintended the republication of Græsch's Greek Testament, containing the most important various readings, and was afterward appointed first lecturer on Biblical criticism in the university at Cambridge. Meantime his parochial and pulpit labors, and the correspondence and conversation growing out of the earnest religious controversy of the time and seasonally, fully and fruitfully occupied him. His portrait by Stuart gives a clear impression of the intellectual grace of his countenance and expression, and the memoir by his sister keeps fresh the tradition of his attractive gifts and presence. Other memorials are his 2 volumes of sermons, and the monument at Mount Auburn, consecrated to his memory a quarter of a century after his decease. After the onerous duties of election week he sank under repeated attacks of epilepsy. The feeling occasioned in Boston by his death did not soon pass away, and his surviving associates always remembered and spoke of him with deep emotion.

BUCKS, a county of Pennsylvania, bordering on New Jersey, and bounded N. E. by Delaware river, which is here navigable by steamboats. This county possesses valuable quarries of limestone and sandstone; and iron, plumbago, titanium, and zircon are found in some localities.

The northern part is hilly; the remainder of the surface is moderately uneven; the whole is in a high state of cultivation. The inhabitants are generally farmers or market gardeners, who supply Philadelphia with grain, fruit, meat, and dairy produce. The productions in 1830 were 1,157,761 bushels of Indian corn, 1,168,719 of oats, 246,536 of potatoes, 25,843 tons of hay, and 2,336,189 lbs. of butter. There were 28 flour and grist mills, 50 saw mills, 23 tanneries, and a vast number of factories of almost every kind. The Philadelphia and Trenton railroad passes through the south-eastern part. This was one of the 3 original counties founded by William Penn in 1682. It was named from the county of Bucks in England. Area 600 sq. m.; pop. in 1830, 50,091; capital, Doylestown.

BUCKSPORT, a commercial, lumbering, and manufacturing village in Hancock co., Maine, on the east bank of the Penobscot, just above Orphan island and the narrows, 10 miles S. of Bangor; pop. in 1850, 3,318. During the war of 1812-'16 it was captured by the English, who sailed up the river as far as this village. A large, substantial fort, built 1848-'50, on the opposite bank, at a bend of the river, now commands the narrows and the river in both directions. The village is regularly laid out on a rising slope. Neat and tasteful houses, with overshadowing trees, give it a very pretty appearance from the river. An excellent academy and good schools are found here. As the Penobscot seldom freezes at this point, Bucksport becomes the winter harbor for Bangor vessels, as well as for its own commerce, which employs 100 sail, engaged in the lumber, coal, and fishing trade. A ferry connects it with Frankfort.

BUCKSTONE, JOHN BALDWIN, an English actor and playwright, born in the Isle of Wight, in 1660. Bred to the law, he deserted the solicitor's office for the stage in 1684. He made his debut in tragedy. The effect of his performance induced him to try low comedy, in which he soon displayed a rich vein of talent. He was first distinguished at the Surrey theatre, London, from whence he was transferred to the boards of the Adelphi. In 1640 he went to the Haymarket. In 1842 he visited the United States. In 1852 he became lessee of the Haymarket theatre. As an actor he is exaggerated without being vulgar, his ripe humor being under the control of a keen intelligence and nice taste. His fault is an extreme mannerism of utterances. As a playwright, he has been very successful. He wrote "Victarius," the "Wreck Ashore," the "Dream at Sea," "Poor Jack," "Jack Sheppard," "Agnes de Vere," "Green Bushes," and upward of 30 melodramas and farces, mostly adapted from the French. His comedies, "Married Life" and "Single Life," are of less merit.

BUCKWHEAT (*polystrum fagopyrum*, Linn.), a species of grain supposed to be a native of Asia, and called *blé Saracén*, or Saracén wheat, by the French, after the Saracens or Moors, who are believed to have introduced it

into Spain. It thrives on poor soils, comes rapidly to maturity, and is most frequently planted in tracts that are not rich enough to support other crops. It is extremely sensitive to cold, being destroyed by the least frost, but it may be planted so late and reaped so early as to incur no danger from that source. Its flowering season continues for a long time, so that it is impossible for all the seeds to be in perfection when it is reaped, and the farmer must decide by careful observation at what period there is the greatest quantity of ripe seeds. Buckwheat does not exhaust the soil, and by its rapid growth and its shade it stifles weeds, prevents their going to seed, and leaves the field clean for the next year. It is sometimes ploughed into the ground in a green state for manure. The seeds of buckwheat furnish a white flour, from which a popular gruel is made in Germany and Poland, and breakfast cakes in England and America. Cakes, and a dark heavy bread, are made from it also in the provinces of France, especially in Brittany. Its flowers secrete a large amount of honey, and are, therefore, always covered with bees; and in the middle United States it is often cultivated for their food. The grain is superior to oats as nutriment for horses and poultry, and is especially efficacious in making the latter lay eggs. The green plant is said to greatly increase the milk of cows, but according to Thaer and Hauser, it produces cramps and a sort of intoxication in swine and sheep which feed largely upon it.—There is another kind of buckwheat distinguished from the preceding by the sharper angles of its seeds, and by its tougher stocks. It is earlier and taller, less sensitive to cold, and produces grain in larger quantity, but of an inferior and bitter quality. It was introduced from Tartary into Russia in the beginning of the 18th century, and it has thence been dispersed all over Europe. Hence its name of Siberian buckwheat, or *polygonum Tartaricum*.

BUCOLICS, a style of poetry introduced by the Greeks, more especially by the Sicilians, descriptive of the delights of the primitive rural life of the herdsmen and mountain shepherds, whose rugged and picturesque days were, for the most part, spent among the forest glades and upper pastures of the mountains, which alone, under the burning suns and in the arid climates of Greece and southern Italy, could afford verdure, shade, or water during the intense summer heats. These poems in Greek, the most beautiful of which are by Theocritus and Moschus, both Sicilians, are generally composed in hexameter verse, and always in the Doric dialect, the life of the woods and hills belonging especially to the Dorian, as did that of the city, with its theatres, baths, and academies, to the Ionian race. Sometimes they relate purely to the topics to which they assume to belong; sometimes they strike a much higher strain, as that of Theocritus, which describes the killing of the Nemean lion by the

Doric hero, Hercules, or the beautiful elegy of Moschus on the death of Bion. The characteristics of these Greek idyls, for so they were called by the writers, are a peculiar racy freshness, belonging to them alone; a love of nature, and an appreciation of its sounds and sights, such as are found in the writers of no other countries, unless it be some of the earlier English poets, from the days of Chaucer down to those of the Elizabethan era, whom the old bucolic poets of Greece also strikingly resemble in the delicacy of the thoughts and the richness and elegance of the fancy which gleam out from the shadows of a rustic and antique dialect and diction, like glimpses of evening sunshine kindling the dewy glades into emeralds and diamonds, among the rugged and rusty trunks of the pine forests, in whose whispered music they took delight. The bucolics of Virgil, though charming poems, are, except that strange one, the 4th, entitled *Pollio*, and seeming to be paraphrased from the prophecies of Isaiah, mere literal imitations of the Greek idyls; elegantly enough done, it is true, but entirely lacking the touch of nature which gives their charm to the true Greek bucolics. The only Latin writer who had an idea of rural beauty, or of the charm of rustic life and enjoyment, is Catullus, who, though his idyls do not profess directly to be bucolical or pastoral, wrote some poems, such as his "Nuptials of Peleus and Thetis," his "Atys," and his "Sirmis," which are as distinctly bucolical as if they had been written under the auspices of Pan, in the glades of Erymanthus, or among the hill pastures of Arcadia.

BUD (Gr. *φύρον*, from *φύω*, to grow), in botany, an organ which contains within itself the rudiments of stems, branches, leaves, and flowers. It is found either at the apex of a stem, or at the axil of a leaf, and is thus either terminal or lateral. Regarded externally, it is an ovoidal, conical, or spherical collection of scales, or rudimentary leaves, arranged one over the other in an imbricated manner. In cold climates a downy or resinous coating is often added to give still further protection from frost to the organs within; but in warm climates, where this protection is not needed, the leaves in the imbrication are both less compact and less numerous. In the centre of this enclosure is a growing vital point, a particle of delicate cellular matter, continuous with the cellular centre of the main stem. A bud is the first stage in the plan of vegetation, and its development constitutes the whole plant. The embryo of the seed is but a primary stem crowned with a bud. This stem elongates through its whole length in growing, and raises the budding apex above the surface of the soil, where its cotyledons expand into leaves. The plumule, or bud of the embryo, then begins its growth from the joint of these leaves, and carries up the second leaf or pair of leaves to some distance above the first, and thus by leaf after leaf, or pair after pair, the whole herb

or tree is built up, a bud or undeveloped portion always remaining at the apex. This bud is a miniature of the whole tree. Its scales have the same relative situation as the proper leaves of the species, and with themselves in the next season become leaves as the germ of the bud expands above them. In this way, by the repeated development of the terminal bud in a direct line, the main stem is produced.—The development of the axillary or lateral buds gives rise to branches. At the axil of every leaf there appear, either perfectly or imperfectly, one or more buds. Under favorable circumstances these buds grow and form branches precisely as the original stem is formed. The branches in turn have buds at the axils of their leaves, and thus branches of a 2d order are formed, and so on indefinitely, the ultimate ramifications being termed branchlets. Some plants, as the palm, put forth no axillary buds; many during their first year are restricted to developing their main stem, but afterward the growth of the terminal and axillary buds goes on together. If every bud came to maturity, every tree would have perfect symmetry, either with alternate or opposite branches. Where the structure is opposite, there would be 2 buds near the apex of every branch, one terminal and 2 in the axils of the nearest pair of leaves; it is rare, however, that one of the 3 does not fall. This failure is in some species regular, as in the horse chestnut, where the lateral ones are checked, and in the lilac, where only the lateral ones grow, making the stem annually bi-furcated. The failure is, however, in most cases as capricious as the phenomena of climate, soil, and the weather. In a luxuriant soil, and in some species saturated with sap, the predestined symmetry of the plant is interfered with not only by failure but by excess, a bud sometimes bearing forth from other parts than the axils of leaves, or 2 or 3 buds sometimes issuing from a single axil.—The flower, like the branch, is evolved from a bud, and its parts adhere to the law of arrangement which has controlled the whole development of the plant. The flower-buds and leaf-buds are identical as to situation, and the leaf of the branch passes by regular gradations into the sepal, petal, and stamen of the flower. The organ which has produced the whole plant from the embryo of the seed is not supplanted, nor its plan changed, in producing the final work of inflorescence and fructification; but for the new end now to be accomplished it receives a more deflexa character.

BUDA, or OXX, a city on the west bank of the Danube, formerly the capital of Hungary, and now that of the circle of Pesth; pop. of the town and its 7 suburbs, including that of Alt Ofen, which was annexed in 1850, 45,685, exclusive of the garrison and the students. It is distant from Vienna, in a straight line, 195 miles S. E., and from Belgrade 200 miles N. W. It was formerly connected with the city of Pesth, which lies on the opposite side of the river, by a

bridge of boats, and since 1869 by a suspension bridge 1,260 feet long; a tunnel to connect the bridge with the fortress has been in course of construction since 1862. Buda is about 9 miles in circuit, and built around the Schlenker, an isolated and shelving rock. Its central and highest part, called the fortress, is the most regular portion of the town, and contains many fine buildings and squares. This fortress is surrounded by walls, from which the several suburbs extend toward the river. The principal edifices of the city are the royal palace, a quadrangular structure 504 feet in length, and containing 263 apartments; the church of the ascension of the virgin, and the garrison church, both Gothic structures; the arsenal, the state palace, and the town hall. Buda contains 12 Roman Catholic churches, a Greek church, and a synagogue, several monasteries and convents, a theatre, and many important military, educational, and benevolent institutions. There are several publishing houses and 3 journals established here. The observatory, with the printing establishment of the university of Pesth, is built upon an eminence to the south of the town, 316 feet above the level of the Mediterranean, and no expense has been spared to furnish it with the best instruments. There are in various parts of the suburbs sulphureous hot springs, and relics remain of baths constructed here by the Romans and Turks, the former tenants of the place. The principal trade of the town is in the wines (chiefly red wines, resembling those of Burgundy) which are produced from the vineyards upon the neighboring heights, to the amount, it is computed, of 4,500,000 gallons annually. There are also various manufactures, and a few manufactures of silk, velvet, cottons, woollens, and leather. The boats of the Danube steamboat navigation company are built here, giving employment to about 600 persons. Buda is the usual residence of the governor of Hungary, and of the public authorities.—It has been thought that this city occupies the site of the old Aquincum mentioned in the "Itinerary" of Antonine. During the Hungarian monarchy, Buda was the residence of its kings, by whom it was enlarged and adorned, especially by Matthias the Great. It was taken by the Turks under Solyman the Magnificent in 1686, but was recovered the next year. It fell again into the hands of the Turks in 1699, and remained in their possession till 1686, when it was finally recovered by Charles of Lorraine, and in 1784 was again made the seat of government. Buda has been beleaguered not less than 20 times in the course of her history. The last siege took place in May, 1849, when the Hungarian army under Gergely had driven back the Austrian troops to the western frontier of the kingdom. Two plans were discussed as to further operations: first, to follow up the advantages gained, by a vigorous pursuit of the enemy on his own ground, to disperse his forces before the Russians, then marching on Hungary, could arrive, and to attempt to revolutionize Vienna; or, to

remain on the defensive in front of Comorn, and to detach a strong corps for the siege of Buda, where the Austrians on their retreat had left a garrison. Görgey maintains that this latter plan was insisted on by Kossuth and Klapka; but Klapka professes to know nothing of Kossuth having sent such an order, and denies that he himself ever advised this step. From a comparison of Görgey's and Klapka's writings we must, however, confess that there still remains considerable doubt as to who is to be blamed for the march on Buda, and that the evidence adduced by Klapka is by no means conclusive. Görgey also says that his resolution was further determined by the total want of field-gun ammunition and other stores, and by his own conviction that the army would refuse to pass the frontier. At all events, all offensive movements were arrested, and Görgey marched with 80,000 men to Buda. By this move the last chance of saving Hungary was thrown away. The Austrians were allowed to recover from their defeats, to reorganize their forces, and 6 weeks afterward, when the Russians appeared on the borders of Hungary, they again advanced, 127,000 strong, while 2 reserve corps were still forming. Thus, the siege of Buda forms the turning point of the Hungarian war of 1848-'49, and if there ever really were reasonable relations between Görgey and the Austrians, they must have taken place about this time.—The fortress of Buda was but a faint remnant of that ancient stronghold of the Turks, in which they so often had repulsed all attacks of the Hungarian and imperial armies. The ditches and glacis were levelled; there remained but the main ramparts, a work of considerable height, faced with masonry. It formed in its general outline an oblong square, the sides of which were more or less irregularly broken so as to admit of a pretty efficient flanking fire. An intrenchment of recent construction led down from the eastern front to the Danube, and protected the waterworks supplying the fortress with water. The garrison consisted of 4 battalions, about a company of sappers, and the necessary allotment of gunners, under Major-Gen. Hentzi, a brave and resolute officer. Seventy-five guns were mounted on the ramparts. On May 4, after having effected the investment of the place, and after a short cannonade from heavy field-guns, Görgey summoned the garrison to surrender. This being refused, he ordered Kmety to assail the waterworks; under the protection of the fire of all disposable guns, his column advanced, but the artillery of the intrenchment, enflading its line of march, soon drove it back. It was thus proved that an attack by main force would never carry the place, and that an artillery attack was indispensable in order first to form a practicable breach. But there were no guns at hand heavier than 12-pounders, and even for these the ammunition was deficient. After some time, however, 4 24-pounders and 1 18-pounder, and subsequently

6 mortars, arrived from Comorn. A breaching battery was constructed on a height 500 yards from the N. W. angle of the rampart, and began its fire, May 15. Previous to that day, Hentzi had bombarded the town of Pesth without any provocation, or without the chance of deriving any advantage from this proceeding. On the 16th the breach was opened, though scarcely practicable; however, Görgey ordered the assault for the following night, one column to assault the breach, 2 others to escalate the walls, and a 4th, under Kmety, to take the waterworks. The assault was everywhere unsuccessful. The artillery attack was resumed. While the breaching battery completed its work, the palisadings around the waterworks were shattered by 12-pounders, and the interior of the place was bombarded. False attacks were made every night to alarm the garrison. Late on the evening of the 20th another assault was prepared. The 4 columns and their objects of attack remained the same, and before daybreak on the 21st they advanced on the fortress. After a desperate struggle, during which Hentzi himself led the defence of the breach and fell mortally wounded, the breach was carried by the 47th Honved battalion, followed by the 34th, while Kmety stormed the waterworks, and the troops of the 3d army corps under Kneziach escalated the walls near the Vienna gate. A severe fight in the interior of the fortress ensued, but soon the garrison surrendered. Of 8,500 men, about 1,000 were killed, the rest were made prisoners. The Hungarians lost 600 men during the siege.

BUDAYOON, or BUDAON, a district of Rohilkund, British India, in the N. W. provinces, bounded N. by Moradabad, N. E. by Bareilly, S. E. by Shahjehanpoor, S. by Furruckabad and Minpoore, and W. by Alighur and Boolundshahur. It lies between lat. 27° 38' and 28° 29' N., long. 78° 21' and 79° 35' E.; area, 2,368 sq. miles; pop. 1,019,161, of whom 877,509 are Hindoos. The country is low, level, generally fertile, and well watered, the Ganges flowing through its S. W. part, the Ramgunga through its E. part, and the rest of the district being intersected by the Muhawa, and the Sote or Yarwuffadar.—The chief town of this district, of the same name, has a population of 21,369. It was occupied by the mutineers, and a body of liberated prisoners from Bareilly, June 1, 1857. The Europeans escaped by flight. Gen. Whitelock marched against the town and captured it, April 19, 1858, after an engagement in which the rebels lost 500 men and 4 guns. On the 30th of the same month the sepoy were again defeated about 10 miles from here, by a force under Gen. Pennyfeather. The rebels were entirely subdued on May 7, 1858.

BUDE (BUDDÆUS), JOHANN FRANZ, a German theologian, born at Anklam, June 25, 1667, died at Jena, Nov. 19, 1729. He lectured upon theology and philosophy successively at Wittenberg, Halle, and Jena. In his writings,

which are very numerous, he often sought to mediate between and harmonize opposite views. Among his principal works are, *Historia Juxta Naturam, Institutiones Theologicæ universales, and Institutiones Theologicæ dogmaticæ.*

BHUMDEA BADA, a strong fortress of Afghanistan, memorable as the place of imprisonment of the British captives spared from the massacre of 1841.

BUDDHA-GAYA, a ruined city of Bahar, much resorted to by pilgrims. It is situated near Gaya, 53 m. S. of Patna, and contains numerous remains of temples and images.

BUDDHISM AND BUDDHA, an Asiatic religion and its founder. Buddha (as known, intelligence) is the generic name for a deluded teacher of the Buddhists, whom we call Buddhists. These hold that innumerable Buddhas have appeared to save the world, among them one in the present period, also known as Sâkyamuni, or Saint Sâkya, who is believed by some to have been the 9th incarnation of Vishnu; by others the son of the moon, and regent of the planet Mercury. He was a reformer of Brahminism, introducing a simple creed, and substituting a mild and humane code of morality for its cruel laws and images. His history is to a great extent legendary, and is divided into 12 sections, viz.: 1. While in the 4th heaven he determines to save the world, and chooses to be born as the son of Suddhodana, king of Kapilavastu and of Mâya, yet a virgin; both of the Sâkya gens of the Kâshtriya caste, and a branch of the Ikshvâku who were of the race of the sun, kings of Ayodhya (now Oude) or even descended from Mahâ Samudra, the first of all kings of the present period. 2. He descends from heaven as a white elephant; is conceived as a 5 colored ray of light. 3. He is born amid great miracles, through the right side, and as soon as born most solemnly proclaims his mission. 4. He is named Sarvârthasiddha (artha, all, artha, wish, request, siddha, fulfillment); his mother dies on the 7th day after his birth; he is cared for by her sister, Prajāpati Gautamī (praja, world, people, pati, master, gautama, care), of the Brahminic, Gautama gens; hence he is called Gautama. 5. He chooses Gopā, also a Sâkya, for his bride, and obtains her after leaving shown his prowess in a public game, and his great learning and skill in arts. 6. After meditating on the vanity of enjoyments, he leaves his father's house and becomes a most austere ascetic and hermit. 7. He performs the most rigid penances, goes to the Bodhimanda or throne of intelligence at Gaya; sits under the Bodhidruma, or *figus religiosa* (banian), where every Buddhist (intelligence of truth) becomes a Buddha. 8. He is tempted by Mâra (mā, to die), the god of love, sin, and death; but withstands his enchantments and terrors. 9. He recollects all his previous births and those of all beings, attains thus to Buddhi (intelligence) and shines forth as the Buddha, "the awakened, intelligent, knowing" (Chinese *fo* *the* or *fo*, also translated *fo* the enlightened; Tibetan, *gangs rgyas*;

Mongol, *Thurben*, Japanese *Butsuda*; the number of his names is 12,000 in Ceylon, and in a Tibetan tract 5,408). All beings become aware of his arrival, and 3 merchants from far-off lands are the first mortals who see him, offering him honey, milk, &c. 10. He "turns the wheel of faith," or becomes a teacher, "enfers the victorious banner of the good law," and proceeds to Varānasi, now Benares, on the Ganges; there he finds his 5 former pupils, and though he preaches in the Maghadhi language he is understood by all hearers of different tongues. Many other fanciful stories, and many philosophic speculations have been interpolated amid the facts in the history of Buddha, especially in the 45 years of his sacerdotal functions. The scene of his priestly life is placed by some in the Deccan, by others in Ceylon, and by others in the Punjab, and even beyond the Indus; although, as a matter of fact, it seems to have been restricted within Oude, south and north Bahar, extending probably to the boundary of Bengal and into the Deccan and Rohilkand. An enormous quantity of sculpture not far from modern Gaya, and other monuments at and near Patna, bear witness to the reality of the reformer's existence. When he appears to discharge his beneficent mission, men and women of all classes and ages, rich and poor, sick and well, flock around him. Most of the rulers become conversant together with their subjects. Śāvāsī (the city of hearing), on the northern bank of the Ganges, became a rival of Gaya. There Anāhāpudika built a magnificent monastery, from which most of the Buddhist holy books are dated. Here Sâkyamuni appoints his pupils as apostles, and performs many miracles. At first he is adverse to the admission of women to ecclesiastical life, but afterward chooses some as his agents. He is also named Bramana (*evama*, to be wearied), or the unchangeable, and is soon opposed by Brahmins and others, especially for admitting the impure and outcast to the privileges of religious asceticism. He humbles the 6 Tirthakas, or sectarian philosophers, and visitors of sacred ponds, whose lucrative occupation is ruined by the new doctrine. Calumny, conspiracies, and snares, all tricks of Mâra, are unsavailing against him. 11. His native city with all his kindred are most cruelly destroyed, by a king of Kosala, shortly before his death in the 80th year of his age. This causes great convulsions of nature. King Asoka raised on the spot where he died a *stupa* or mound with a column to his memory. 12. When his body is about to be burnt, the pile cannot be kindled; but after Kâsyapa has honored the feet of the dead, the "flame of contemplation" breaks out of the braut and consumes the corpse. The pearly, heaven-scented pieces of his bones, which have defied the fire, almost cause a war for their possession, but are at last divided among 7 competitors, who erect stupas over them.—Even if an actual personal existence be denied to Sâkyamuni, the religious reform itself must be admitted as a fact.

Among the Buddhist nations there is a difference of about 2,000 years as to the date of his death. As the skilfully contrived story of 38 Buddhist patriarchs in uninterrupted succession is now exploded, we prefer the Cingalese date of 548 B. C. Brahminism had become intolerable. Sākya-muni rejects the Brahma, the authority of the Vedas, the sacrifices and all Brahminic rites. Even popular Buddhism in adopting the Brahminic gods degrades them below Buddha, even below the Arhats (*arha*, to worship) or venerable priests, thus raising men above the gods. Buddha, a man, and not an incarnation of a higher being, is self-perfected. In the Vedas also, holiness, piety, meditation, and wisdom are mightier than all gods. Indian virtue, more passive than active, consists in the taming of sensuality, of one's own will, in sympathy with all beings, in self-sacrifice. As soon as sin is uprooted, infinite knowledge opens.—Originally, Buddhism was simple, ethical, and rational; and hence hostile to mythology, scholasticism, ceremonies, and priestcraft. It was benevolent and humane in the highest degree. It improved upon the Sankhya philosophy, and rendered it popular and practical. It called all men, without any distinction of quality or position, to its fold, opening to all the way of salvation, which it teaches to be attainable by purity of conduct. Castes, however, were not directly abolished, but ignored, so that they exist to this day in Ceylon, the great southern stronghold of Buddhism. "I am a *Bhikkhu*" (beggar), says Sākya-muni, without Brahminic pride. "There is but one law for all: severe punishment for crime, and great reward for virtue." "My law is one of grace for all; like heaven affording room for men and women, for boys and girls, for rich and poor." "It is difficult to be rich and learn the way." In a legend all lamps kindled in honor of Buddha ceased burning, except one offered by a poor woman. Ananda, his favorite disciple, drinks water drawn from a well by a Chandali. Sākya-muni spoke to the people in parables under the free sky; united the scattered anchorites into communities, orders, and monasteries, some for men, some for women; also allowing persons of both sexes to be lay members without vowing chastity and mendicacy. The clergy were made the foundation of Buddhist society, whereas in other creeds the laity are the basis on which the hierarchy reposes.—The first period of Buddhism, from Sākya-muni to its recognition as a sort of state religion in the great Prāchīna or Praasian empire and beyond Hindostan, comprehends the fixation of the dogmas, its first schisms, and œcumenic councils. Kāsyapa, the principal disciple of Sākya-muni, held the 1st council of 500 Arhats at Rājagriha, establishing the Vinaya (*vā*, before; *ni*, to conduct) or discipline based upon the Sūtras (*śrī*, to sew, string) or apophthegms and sermons of Buddha. Disorders in the great monastery at Vaisālī called for a 2d council in that city during the reign of the king Kālsoka, a great protector

of the faith, about 100 years after Sākya's demise. The history of Buddhism at that time is enveloped in the greatest darkness. Among about 18 sects 2 are prominent, viz., the Vaibhāshika (*vaibhā*, division) or dilemmists, with many subdivisions; the Saṅtrāntika (*sutra* and *antika*, near), or close observers of the original maxims.—Alexander's invasion of the Punjab gave a great impulse to the spread of Buddhism. The Nanda dynasty of Magadha in south Bahar was overthrown by the miraculous Chandragupta, or Sandrakottas, who freed the Punjab from Macedonian rule, received Magathenes at his court in Pataliputra, and united all India under his sceptre. Through his origin as a Soodra, and through the invasion in question, he broke the power of the Brahmins. His grandson Dharmāsoka, the greatest king of the Maurja dynasty, extended the empire, and being miraculously converted, became from a cruel tyrant the most pious observer and the most zealous propagator of Buddhism. Under the name of Piyadāsi (love-gifted, pious) he published most humane edicts, many of which are found engraved on columns at Delhi and Allahabad, and on rocks near Peshawer in Guzerat, Orissa, &c., not in Sanscrit, the language of the Brahmins, but in Prakrit or popular dialects. These edicts inculcate the practice of virtues, order the construction of roads and hospitals, and even abolish capital punishment. The 3d great council was held at the command of Piyadāsi, at Pataliputra, where 1,000 Arhats tried to cure the great anarchy caused in the church by sectarians, and false and licentious monks. At the conclusion of the council, an earthquake is said to have approved its decrees. The most probable date of this council is 218 after Sākya-muni's death (328 B. C.) Scarcely any book which passes for the word of Buddha is prior to this council, in which the decrees of the preceding councils were modified; indeed, it may be doubted whether any such book reaches even so far back. The creed was introduced into Ceylon in the first year after the 3d council, where it was preserved for a century merely by oral tradition. In less trustworthy quarters than the Cingalese there are manifest contradictions; the Nepalese believing that Sākya-muni wrote 9 books, while the Chinese derive the canon from the first council, and the Thibetans say that the Tripitaka (3 baskets) were written 2 centuries after the 3d council. In preparing the canon, Sanscrit was probably used along with other vernacular tongues by the disciples. The books of Ceylon, Burmah, Siam, are translated from the Pāli, a form of writing of the Magadhi, a dialect of the Sanscrit. The code of the 4th council, held in Kāsmira, is in Sanscrit. Unlike the Brahmins, who thought barbarians unworthy of their holy religion, the Sthaviras or elders of the 3d council had sent out apostles to preach in foreign lands, who converted the Nāgas (snake worshippers), and other idolatrous tribes of Cashmere; the Hima-

rest (now remaining), lower Calcut, Gandhara now Candahar, Yavona (from Java, probably Rangoon, India, and the satrapies of Alexander), Ujjain, now Calcutta, also received apostles. The Decan and even Pegu, and Burmah, were not forgotten, although the creed was carried thither much later from Ceylon. Buddhism carried the elements of Indian civilization to many a savage tribe; broke up many a cruel custom and became a blessing to the greater portion of Asia. But in time the great Buddhistic body was split, by its own extension, into a southern church, whose chief seat is in Deva Lanka, the divine island, or Ceylon, where it has been least altered from its ancient condition, and whence, during more than 5 centuries, it was propagated, even to further India; and a northern church, divided into many important branches, owing to the great number of nations that profess it; the Nepanese branch being less divergent from the ancient faith, than those of Tartary, Mongolia, Tibet, China, and Japan.—In Hindostan, the primitive character of Buddhism was greatly impaired by its long and bloody contest, as well as its mixture, with Brahminism, and especially with the sanguinary tenets of Sivaism; and, it finally degenerated and degenerated into a medley of incongruous creeds. About the beginning of our era a new school or sect, called Mahayana (great passage), was added to the older Hinayana (little passage) by Nagarjuna, a celebrated Sthavira; and another in the 9th century of our era, called Yogichara (*yoga*, junction and magic, *chara*, to go), or Tantra, a sort of Sivaistic mysticism, by the Bhikshu Asanga. Even in Ceylon heretical tenets were inserted in the code of the Tripitaka by the learned Buddha Ghosha at the commencement of the 5th Christian century.—Among the Greek and Roman writers who have more or less imperfectly dwelt upon the men and affairs of India, Herodotus (Book i. and iv.) names the Bodisoî; Megasthenes, though residing at Palibothra, does not speak of the Buddhists, although (about 300 B. C.) he gives a full account of the 5 rivers of Pentapotamia, and describes Indian manners; Strabo speaks of 2 religious systems in India (Book xv. of his geography) that of Brahma, and that of the Garmans (apparently the Germanes, a sort of saints, probably Buddhists); Arrian mentions a Goodras as 3d king of India; Clement of Alexandria speaks of a deified Buddha; Victorinus and St. Jerome, of a Buddha; Cedrenus and Heides, of Bodas. Clement and Jerome call that personage a gymnosophist, meaning probably the Jain sect which worshipped naked idols, and whose chief priests were naked.—The Jesuits have endeavored to prove Buddhism to be of Nestorian origin; but the Nestorians sought the protection of the Sassanids in Persia, and came into central Asia after their expulsion from the Byzantine empire, as late as the 5th Christian century. It is more probable that Buddhism had an influence on western creeds, so the in-

fluence, on the Quakers.—Buddhism was introduced into China by 2 ways, namely: in the south by sea, 66 B. C., and in the north through Khotan, over the great wall into Hsienai, in the 5th century. From Corea, where it existed about A. D. 370, it was brought into Japan about 550 to the court of the Dairi. Some writers assert that it entered that country as early as A. D. 60. From Ceylon it found its way into Aracan, Burmah, and Pegu, then a mighty empire, A. D. 397, Siam, Laos, Anam, Cochinchina, Tonquin, and Ava. From Nepal, where there is a very rich Buddhistic literature, the creed came into Thibet and Mongolia, the Mongol emperors of Hindostan having instituted a patriarchate. In Thibet, great dignitaries, called (about 1400) Dalai-Lamas (Sea priests), pretended to be personified Reddhivats. Many Calmuck and other tribes of Tartary and Siberia also adopted this religion, and its influence is even perceived in Swedish Lapland. Its priests bear different names, as Talapoins (umbrella bearers) in Siam, Bonzes in Japan, Rahans in Mongolia, &c.; they are dressed in yellow gowns, shave their heads, and go about bare-headed. The total number of Buddhists is about 200,000,000. In all Buddhistic countries there is a profusion of temples, monasteries, stupas, Jangokas (pillars and mounds containing relics of Buddha), and other monuments overlaid with statues and sculptures of deities in grotesque forms. Among the great number of ancient grottos, containing temples and cells hewn in rock, many of them also containing monuments of Brahminic worship, we may mention those on the islands of Sablette and Elephante, those at or near Dhammar, Carli, Naeuk, Ayant, and those most magnificent specimens at Ellora. Ceylon boasts of its Laya Maha Paya, with 1,600 pillars; of its mountain temples at Mahentele, grottos and temples at Dambulgala, &c. Most of these are in ruins caused by time or by Portuguese devastation.—Of the many battles of the Buddhists with the Brahmans in India few turned out favorably for the former, one of their victories only (A. D. 478) being worthy of record. Although Buddhism was most ruthlessly overthrown during a contest which lasted for 15 centuries, still some of its traces remain in Hindostan. In the 4th century, Fa-hian witnessed its decadence, and with other Chinese pilgrims, especially Hsiao-Tsang (629-'45), recorded what remained of it and its monuments.—Having thus narrated the history of Buddhism, we now come to a summary of its doctrines, and of their principal ramifications. First of all, Buddhism maintains the vanity, unreality, and illusiveness of nature. Naught is everywhere and always, and is full of illusion. This very nihilism levels all barriers between castes, nationalities, and conditions of worldly fortune, embracing even the vilest worm in the brotherhood of Buddhism. "All compounds are perishable," is the last sentence which Sakyanami is believed to have uttered. The final object is *Moksha*, Nirvana, or the deliverance of

the soul from all pain and illness. The endless rotation of metempsychosis is broken, by preventing the soul from being born again. This is attained by purification from even the desire of existence. These fundamental traits of Buddhism are plainly comprehended in the most ancient positive dogma, which is contained in the 4 *Aryāni Satyāni*, the sublime truths attributed to Śākyamuni in his first sermon in the gazelle-grove near Benares. These 4 truths relate to pain, its origin, its annihilation, and the way leading to annihilation. "Pain is birth, age, disease, death, the meeting with what one dislikes, the separation from what one loves, the failure to obtain what one strives for. The causes of pain are the desires, lusts, passions. Annihilation of all these causes is the third truth. The way of annihilation again has 8 parts: right view, right sense, right speech, right action, right position, right energy, right memory, and right meditation." Such is the "formula of faith," found upon many monuments, as well as in many books. The essence of Buddhistic morality is "to eschew every thing bad, to perform every thing good, to tame one's thoughts"—this is the doctrine of Buddha. As the doctrine of Mohammed is succinctly called *al-Islamu* (obedience to the precepts of the apostle), so the precepts of Śākyamuni are named the "Way (*Gati*)," or the "Way of the 4 truths." To teach is "to turn the wheel of faith." The genuine law of Buddha Śākyamuni was contained in these 4 truths, and was altogether moral and practical. All the mythology, sacrifices, penances hierarchy, scholasticism, mysticism, which we find connected with it, have been superadded in progress of time, in different countries, and under manifold circumstances. This mixed Buddhism, as depicted in the above-mentioned Hinayāna, comprehends 8 sections, the Dharma, Vinaya, and Abhidharma. We will give an account of each in its order: I. THE DHARMA (virtue, duty, law, from *dhrī*, to support), comprehends the revelation, the dogmas, and their precepts; and in a strict sense, cosmology and cosmography, mythology, metempsychosis, and the theory of salvation. Buddhism knows of no creation. "The worlds are, from the not-beginning, in a continual revolution of arising and of perishing." Succession is the only reality; every thing else being a process and progress of becoming in the concatenation of cause and effect. This rotation has no cause, hence no beginning. It is not within the domain of the intellect to know whence all entities come or whither they go. Four things are immeasurable, viz.: the science of Buddha, space, the number of breathing beings, and that of worlds. A Buddha alone can conceive the worlds. It is heftsy to believe the worlds limited or illimited, or neither limited nor illimited. Mount Sumeru is the centre of the world, as deep in the ocean as it is high above its level. This ocean is enclosed by a girdle of rocks, within 6 other concentric oceans with similar girdles, which decrease toward the periphery (the

oceans in breadth, the rocks in height), in the progression of 84, 42, 21, 10½, 5½, 2½, 1¼ thousands of yojanas (about 5 miles each). The whole stands again in the genuine ocean known to men, in which are the 4 islands with 500 islets each. The southern island, or India, is triangular, with men of trigonic face, living 100 years, 3 yards high; the eastern, semicircular, with men of semilunar face, living 250 years, 8 yards high; the western, circular, with round-faced men, living 500 years, 16 yards high; while the northern island is quadrangular, containing the happy square-faced hyperboreans, who live 1,000 years, and measure 82 yards. Chakravāla (*chakra*, region; *vāla*, to encompass), or an iron wall of 8,610,850 yojanas, near which the sea is very shallow, surrounds the above-described group. Each such universe has its own sun, moon, stars, and hell. The Meru is like an index of a dial, shading each island, and thus producing night. Above the Meru rise the heavens in the following order: 1. *Dēva lokas*, or heaven of the gods, 6 in number, forming with the earth the *Kāma dhātu* or lust-principle. 2. Above it the *Rūpa dhātu* or form-principle, with 4 *Dhyānas* (divine and clear contemplations), of which the first has 3 heavens for the Brahmās and their servants; the second 3 for the gods of light; the third 3 of purity; the fourth 7 of merits, exemption from pain, beauty, &c. 3. Still higher is *Arūpa dhātu*, or formless and colorless principle, with 4 heavens, viz.: one of illimited space, one of illimited knowledge, one of naught, and the 4th of neither thinking nor not thinking. Among the extreme heavens, the lowest in position and majesty is that of the *Catur mahārāja kāyikas* (*quatuor magnorum regum comitum*), or kings of demons, a sort of magnates guarding the higher heavens. The 2d. *Trayastrimśas* (*triginta trium*) belongs to Indra, who is the highest Buddhist god. The 26th of the *Nāidāsanjñāndsānjñāyatanam* (*nec velut cognocentium nec non cognocentium*), or the 28th and highest heaven of all, affords a life of 80,000 great Kalpas or periods from the origin of one world to the beginning of another. The 4th *Dhyāna*, referred to above, comprises 1,000 *Dhyānas* of the 8d kind, or 1,000 millions of worlds of lust, with 1,000 millions of 1st *Dhyānas*, and 5,000,000 of the 2d; the whole forming one great chiliocosm, or 1,000 worlds. Again, 1,000 great chiliocosms, as many as perish at each revolution, form a Buddha-territory, or system of a single Buddha. With the northern Buddhists "3,000 great chiliocosms" is a stereotyped phrase. Twenty great chiliocosms, piled one above the other, rest on a lotus-flower, of which an infinite number blossom in the "sea of aromas," each bearing 20,000 millions of worlds. The number of these aromatic seas is again 10 times as great as the number which we would write with a "unit followed by 4,456 488 zeros," and which would extend, in common print, in a line of 44,000 feet. The above-named 3 groups of worlds and

heavens are peopled everywhere by entities of 6 *Gatis* (going or ways of re-birth), of which the first 2 are good, and the last 4 bad, viz.: 1. The way of the Devas, or gods, who, although unavowed by Buddha, have been adopted by his followers. The gods dwell in the 26 or 28 heavens, and are named accordingly; the 4 great kings, the 50, the not fighting, the joyful, the chance-enjoying, the changing others arbitrarily, the assembled Brahmins, the servants of Brahmā, the great Brahmins; the gods of limited light, of illimitable light, of pure light; of limited purity, illimitable purity, perfect purity; of great merits, the unconscious, the not great, the exempt from pain, the well-seeing, the beautiful, the highest; illimitable space, illimitable science, the place of naught, that of no-thought, and not no-thought. 2. The way of men. 3. That of the Asuras, (9, not, *suras*, spirituous liquor,) or most powerful bad gods, of monstrous shapes. 4. That of unreasoning animals, divided into footless bipeds, quadrupeds, multipeds. 5. That of Pretas, goblins, monsters of hunger and thirst, giants, moving skeletons, fire-eaters, vampires, &c. 6. The domains of hell, placed originally in 4, later in 8, at last in 100 halls of all degrees, from a sort of limbo or purgatory to the *Lokantantika Navata*, or intermediate hell, destined for sceptics, who are the greatest of all sinners. These halls are of Brahminic invention.—Asses and plant, or egg and bird, contain and follow one another in an endless series; so is it with worlds. Innumerable worlds have thus appeared and disappeared. This chapter of world-renewals is the most contradictory and inconsistent in popular Buddhism, because it grew up by agglomerating the fantastic notions of many people around the nucleus of the purer doctrine. A Kalpa is a period of destruction, and reconstruction, and a *Maha-Kalpa* or great Kalpa, as we have said, is that from the origin of a world to the beginning of a new one; it is subdivided into 4 *Asankhyap-Kalpas* or incalculable Kalpas, viz.: of destruction, interval, renewal, stability; each again with 20 *Antara* or intermediate Kalpas. If it should rain incessantly during 5 years on the whole globe, the number of the fallen drops would not equal that of the years of one *Asankhya*. Each destruction is announced 100,000 years in advance by a Deva, calling on all beings to avoid sin, to repent, &c. Monsters and misery of the damned are reborn as men; the denizens of the lower heavens and men rise higher. At the appointed time a great cloud rains for the last time; then every thing dries up, lower beings are advanced, and only serpents and snails are reborn into the *Lokantantika*. The dress of nature is now annihilated; a 2d and a 3d sun dry up all flowing waters; a 4th and 5th dry up the ocean; a 6th heats the earth up to the seat of Indra; the 7th at last kindles it to a flame, which consumes the world to less than ashes, up to the heavens of the Brahmins inclusively. The liquid destruction by cosmic waters is somewhat analogous, and reach-

es beyond the 3d Dhyana. Wind destroys still higher up the whole 36 Dhyana. The scheme of the intensity of the destructions is: the 1st, 3d and 5th, are moderate; the 2d and 4th are middling; the 4th is great. The world preceding the present was greatly destroyed. In short, there is a whole minute tariff of the medium, degree and extent of world-destructions. The 4th Dhyana forms the limit of destruction, it being, together with the higher heavens, a reservoir for the reconstruction of the universe. The Kalpa of emptiness is a dark vacuum below the preserved heavens, existing during 20 intermediate Kalpas; after which a wind from the 10 quarters begins to blow; then a cloud gathers; rain contained by the wind as in a vessel, fills the vacuum up to the reservoir; then all beings are reproduced by the charming action of the wind; first the annihilated Dhyanas, then the lower regions, the "throne of intelligence" and the Bodhi-tree, near Buddha-Gaya (*got*, to sing), and the lotus, whose number of blossoms is emblematic of that of the Buddhas (originally 8, afterwards 1,000) in the future Kalpa. Many of the beings preserved in the higher heavens are reborn on the new earth, with bodies shining like the sun, and live by meditation. After having tasted of the sweet new earth-sap, these bodies begin to ferment with lust, to have need of the sun and moon (which only then shine forth), and they deteriorate in the ratio of their appetites. Their nutriments grow coarser, and excite sexual desires, which beget the necessities of birth and other evils. The greedy accumulate too much rice, which ceases to grow spontaneously; agriculture therefore becomes imperative. Then "mine and thine," or ownership, are contrived; followed by laziness, gluttony, dissipation, envy, avarice, theft, murder, war, &c. Therefore, Mahā Sammita (the great ascetic) was chosen as the first king on earth; and custom followed. The duration of life sank with the deterioration of beings to 80,000 years; many are reborn as animals, and at last, hell yawns. After this, follows the Kalpa of stability. In it the life of men lasts only 10 years, then 80,000, and thus gradually and alternately 20 times, in the ratio of sixfoldness. In this the most majestic and perfect Bodhisattvas are born, for the renewal of the Dharma. A Kalpa with 6 Buddhas, is called *Shakra* (prosperous, virtuous), and such is the present one, which is in its decline. Deterioration by sin is cured by wars, pestilence, hunger, scourges, which arouse the survivors to better conduct.—The world is governed by destiny. This differs from the Greek *moira*, the Latin *fatum*, and the *marifet* of the Islam; nor is it a law of nature, or an eternal decree, or predestination. According to the Buddhists, living beings are by no means products of nature. Only because the entities have slided from eternity or become material, matter exists; because they are from eternity is the process of purification, the innumerable worlds arise and vanish. The entities are the marrow, the universe is its lodging. In short,

the universe is a result of the morality of breathing beings, and destiny is the product of their merit and guilt. There is no indivisible absolute Brahma, as the germ of nature. The cardinal point of the rotations of the worlds lies in the lowest stations of the 4th Dhyāna, viz.: in the 2 heavens of the gods of great merits and of the unconscious, which form the line of demarcation between sin and sinlessness. Morality is the prime agent of that whirlwind which tosses the universe into being and not-being. The mode of its action is variously explained.—Beings migrate, because they are sinful, by having fallen through terrestrial nourishment into avarice, hatred, &c., in consequence of unatoned guilt in former lives. Buddhism makes no inquiry into the origin of individual entities. Sansāra (*saṃ*, Lat. *simul*, *ers*, to go) or mundane life, is the fundamental evil, the ocean of existence with the 4 poisonous streams: birth, age, disease, and death, upon which we are tossed by the storm of passion; restless and without haven. Out of the Sansāra there is naught; on the one hand there is emptiness, and on the other Nirvāna, or beatific enfranchisement. In Sansāra there is no truth, no essence; all is deceit and fallacy. It is only constant in inconstancy; in it every form or determination breaks like a bubble. Birth leads to death, death to rebirth, youth to old age; beauty, health, wealth, vanish. All ages are beset by peculiar evils. Death is not the last of pains, for it leads to birth again. Sin degrades to a lower being or leads into hell. Even godliness does not exempt from rebirth or from relapse into a bad *Gati* (way) of rebirth.—With regard to ontology, and psychology, the philosophic schools of Buddhism are at variance, and especially concerning the notions of the soul, and of the Nirvāna. In some cases the soul of man may sink even below the 6 *Gatis* or ways of rebirth into the vegetable and mineral way; although this view is less supported by the more ancient texts, than by Brahminic or Thibetan legends. *Klesa* (*klīṣa*, to suffer or inflict pain), or the original sin in a former existence, is the fountain of all evil. Its conquest is the last aim of all life and effort. He who breaks its fetters, "breaks through the eggshell" and escapes the alternation of births. The *Klesa*s awakens evil desires, which are chains to existence; this clinging to life impels us to a renewal of existence, and to further wandering after death; the love of life begets new life. Both this motive and the so-called destiny by morality have their root in the *Klesa*: the former acting as impulse or gravitation into corporeality, the latter, as the germ, leading to the realization of the former. With the death of the body the soul is not freed from its desires, but wanders by that *Gati*, which it deserves. All good and bad deeds are balanced against each other like credit and debit in a commercial account, and determine individual destiny, not provisionally but in consequence of the endless chain of causes and effects. Only

a Buddha or an *Arocha* (*aroha*, to worship) or saint can overlook and unravel the thousandfold knotted threads of the moral chain. Buddha said once to Ananda: "If a well-doer comes to hell, the merit of his present life is not yet matured, but the evil of a former. To be rewarded before such maturity would be tantamount to being paid before the appointed term."—Freedom is obtained only after the escape from the bonds of desires, and from the power of our past deeds. Then only do we see, with a "divine eye," our numberless births, risings and fallings, which are all due to our actions. The succession of the existences of a determinate being, is also a succession of souls, which are united by the law of moral causality, each one being the product of the guilt or merit of all its predecessors. When an individual dies, the body is broken, the soul is extinguished, leaving merely its deeds with their consequences, as a germ of a new individual. According to the germinating power, determined by the *Karma* (morality of actions), the result is an animal, or a man, or a demon, or a god. Identity of souls is thus replaced by their continuity, in the solution of the moral problem. Each soul inherits the fruits of the *Karma* and the office of liberating and purifying its predecessor. I ought, therefore, not to act well merely on behalf of my own selfish weal, but for the benefit of a new "I," which is to follow after me. The Buddhistic metempsychosis is, therefore, rather a metamorphosis of the soul. "A lamp is lighted from another; the lamps differ, the second only receiving the light from the first. So is it also in regard to souls."—The final goal of Buddhistic salvation is the uprooting of sin, by exhausting existence, by impeding its continuance; in short, by passing out of the Sansāra into the Nirvāna. The signification of the latter term is a prolific subject of discussion and speculation with the different philosophic schools and religious sects of Buddhistic Asia. Its interpreters prefer vague definitions, from fear of offending sectarians. It means the highest enfranchisement; to theists, the absorption of individual life in God; to atheists in naught. The Thibetans translate it by *Mya-ngan-los-hdāh-ba*, the condition of one freed from pain; eternal salvation, or freedom from transmigration. Its etyma are: *nir*, not; *van*, to blow, and arrow; its orthography is *Nirvāna*; its collaterals are: *Nirvānamastaka*, liberation; *nirvāpa*, putting out, as a fire, &c. It is *Nibbāna* in Pali, *Niban* in Burmese, *Niruphan* in Siamese, *Ni-pan* in Chinese. Weighing all divergencies in its exegesis, it may be safely designated as the definitive enfranchisement from existence without a new birth, the cessation from all misery. It is the Beyond of the Sansāra, its contradiction; without space, time, or force. In the 8d council it was declared to be ineffable and indescribable. Life being the *summum malum*, its annihilation is the *summum bonum*. The common definition is "total annihilation of pains and of the *Skan-dhas* or attributes of existence." But this

"bestifying degree of naught" became with the last a mere emancipation from suffering and cessation of existence. By dint of Dhyāna (divine meditation) and of ecstasy, the soul, forsaking its selfness, may, even during bodily life, walk itself momentarily in the Nirvāna; and for this reason this was also considered as one of the higher heavens, as the empyreum of the formless and colorless world. In progress of time, the Nirvāna was divided into 3 kinds. The simple Nirvāna, the Parinirvāna or complete Nirvāna, and the Maimparinirvāna or great complete Nirvāna, ascending to the 3 degrees of wisdom and of sanctity. In the modern mystic-panteistic schools, which contain a mixture of Srauta, the Nirvāna means the return into the abstract, senseless moral or original Buddha. From a higher point of view, both the Samsara and Nirvāna are such a naught; the former being changeable naught by dooption; the latter naught absolutely. The Samsara exists only to ignore; it is a mere illusion of the Maya. From the destruction of this ignorance, the Nirvāna results.—In the Kalpa of restoration the most perfect Buddhas appear to turn the wheel of faith, and inaugurate a new period of revelation and salvation. Innumerable Buddhas have already appeared. They are beings who have raked themselves with their own energy, by virtues and sacrifices of all sorts in thousands of births, to this highest pinnacle. All are born in central India, and their mother dies on the 7th day after giving them birth; their doctrine is one and the same; in short, their whole biography is a stereotyped copy of that of Sākya-muni. They differ merely in parentage, one being of Brahminic, another of Kshatriyic, extraction; in age (which is determined by that of the period in which they reveal themselves), one living less than a hundred, another many thousands of years; in size, one being 6 feet, another 80,000 miles in stature, according to the character of the period. They are called Tathāgatas (*tatha, thus; gata, known, and gone*). The teaching of each evaporates with time, while sages grow. Then a Bodhisattva (intelligence of truth) is chosen among, and by the blessed on high, who is to become by a new birth on earth, a Buddha. His career has 3 stages of immeasurable length, viz.: 1. That of decision to become a Buddha; 2. That of prospect; and 3. that of nomination by the Tathāgata, whom he meets on earth. Only a monk possessed of the fruit of the 4 Dhyānas, and who has met with a Buddha during a preceding life, can thus be chosen. The exercise of the 6 Paramitas (*Paras; Lat., proter; ita—ita, a, on*) of charity, kindness, patience, energy, meditation, and wisdom, in their highest degree, and during millions of existences, can alone fit the individual for this career and mission.—Few of the innumerable Buddhas, who are said to have lived on earth many millions of Kalpas before Sākya-muni, are nominally recorded; but 24 of his immediate predecessors are mentioned by himself, all of whom promised him that he should be-

come a Buddha; especially Dipaṅkara Buddha and 6 others. Of the 6 avatars of the present Bhūta Kalpa 2 appeared before Sākya-muni, namely: Kāśyapa (*brahmin, saw; uka, uka*), Karakāsi (*baraka, gold; muni, saint*), and Kasyapa (*śāyā, spirituous liquor; pa, to drink*), while the 5th, Maitreya (*mītra, friend, charity*) is yet to come.—Many legends concerning the predecessors of Sākya-muni are applied to him; and it is not absurd to suppose that he represented his doctrine as pre-Brahminic. All these Buddhas of the dimmest antiquity are dogmatic, mythological, and fantastic personages. Our historic Buddha is also not altogether free from legendary qualities. For, says a legend, when in unattractive fore-ages, Brahmā saw a youth carrying his mother through a most terribly tempest, he fastened into his heart the wish to become a Buddha. This wish lasted during the revelation of 195,000 Buddhas, and his progressive stage was matured while 287,000 Buddhas were turning the wheel of faith. As a Bodhisattva he offered flowers to Dipaṅkara, on a spot near the present Jellalabad.—The *Jātakas* (*Jana, to be born*) and *Jātakamālas* (*māla, wreath of flowers*) on the migrations of Sākya, are a favorite subject of oriental monastic poetry, as well as of the pictorial and plastic arts, and a source of many pious frauds. *Maṅgala* (the wise and the fool), a Tibetan collection of such legends, and kindred works, are of recent date. Sākya-muni, although passing through 560 transformations (as king, hermit, priest, courtier, Brahmin, Indra, merchant, and as animals of many kinds), in a Cingales legend, preserved his Bodhisattvic character in the greatest purity. His sufferings on behalf of the salvation of the world, were extraordinary in their number as well as in their most horrible nature. These *Jātakas* took place mostly at Benares and on the Indus, about the time of Christ's birth, and the centuries immediately succeeding. A spot is shown even now at Alcock, where, as a prince, he offered his body to be devoured by a starving tigress and her young; and a few miles thence another, where he used his own skin as a tablet, splinters of his bones, as styles, and his blood as ink, to record a lost passage of the Dharma. In the legend of the royal prince Vesantara, his penultimate life as a Bodhisattva is ushered in by his *Maha jātakā*, or great birth. This legend is popular among all Buddhist nations, from the Calmucks to Ceylon and Siam; in it he makes the most extraordinary sacrifices of his person and of his wife and children. Vesantara went to the heaven of the joyfid; thence, in the shape of a white elephant, into the body of Maha Māya to be born as Sākya-muni. His royal father became his other father, Suddhodana. The law which he revealed is to last for 5,000 years, and disappear with the world before the advent of Maitreya, whom he had already crowned in heaven, and who is to bring a period of peace and holiness upon earth. II. The *Vinaya* (*śā, before; sa, to guide*) is the discipline of the priests; one of its parts, called

śīla (to learn), regards the morality of laymen. The *Sramānas* (sense-tamers) are bound to observe 250 ordinances. Of these 10 are essential, viz.: not to kill, not to steal, to be chaste, not to lie, not to get drunk, not to eat in the afternoon, not to sing or dance, &c., to abstain from ornamental dresses, not to use a large bed, not to receive precious metals; 5 concern the respect to be paid to Buddha, to the law, and to the priesthood. Good conduct, good health, and little learning suffice for admission to monkhood; even in very early youth. The novice is enjoined to eat only the leavings of laymen's meals, to wear a soiled garment of rags, to live near the roots of trees, to use the urine of cows as medicine, not to boast of superhuman faculties. Ordination is performed with many ceremonies, on great festival days. The vows do not bind for the whole of life. The clerical dress, which consists of an under-jacket, a gown reaching to the knees, and fastened by a girdle, and a cloak over the left shoulder, all yellow, must be kept on, even at night, and its loss entails that of the priestly character. Different climates, sects, and dignities have introduced some modifications; thus, Lamaists wear crimson or violet garments. New and costly materials, cut in pieces, are sometimes sewed together and sprinkled with dust, to comply with the letter of the law. Except apostles and very holy men, all others shave their heads and beards at the new and full moon. The nails and teeth are kept clean. The indispensable implements of a Bhikshu or mendicant are: a great, round, narrow-mouthed bowl, without a handle, for receiving alms; a sort of sieve or ewer to filter water; a staff or umbrella; a rosary of 108 beads; a razor, and needles. Beside these, he has no property, and lives altogether on alms, which he collects without importuning the givers.—Solitude and wandering about, begging without a fixed residence, were soon exchanged for residence in convents, with cells for single monks. Celibacy is strictly enjoined. The homes of luxury, of nobles, of widows, and infidels, must be avoided by the begging monk. The receiving of alms or of presents is regarded as a favor to the giver, who is more benefited than the receiver. It is a sin to receive more than is needful for one meal, or to spill a part of the gift, or to separate liquid from solid victuals. Animal food is forbidden, and even vegetables while retaining the power of germinating. Although poverty be a law for single monks, the monasteries can receive and possess great wealth, lands, serfs, &c., for the maintenance of temples and stupas. Obedience and subordination are less required than fraternal and peaceful conduct. Sins are confessed twice a month, to an assembly of at least 4 priests. The penalties are not cruel, and consist in repentance, reprimand, suspension, or expulsion, according to the character of the sins. Nuns (*Bhikshunis*) have to observe the same rules as monks, and to be respectful to them; some are allowed to

dwell with their parents or friends. They also shave their heads, dress in white, and go about begging, sometimes for the monastery. The abbots, or heads of monasteries, are chosen by a meeting of the monks; but in Siam and Burmah they are appointed by the king, and among the Lamas of Thibet they are elected by the college. The number of monks in a monastery is from 4 to many thousands, especially in northern countries; for instance, in the collegiate monastery of the Chutucts, in Mongolia, there are 80,000. On the whole, the hierarchy is more democratic than monarchic. We have seen that the uninterrupted series of 28 patriarchs, who are believed to have followed Buddha Sākya-muni, has no historic foundation. In Thibet, however, there is a minutely regulated hierarchic and monarchic government under the Dalai-Lama, who is always reborn after death in another person, and whose administration is carried on, during his minority, by regents.—In the beginning Buddhism was very simple, without a complicated system of saints; but in progress of time we find: teachers of theology; *Aryas* (venerables), who know the 4 truths; men of the 4 paths or fruits those who have attained the stream which floats them into the Nirvāna; others who will return yet once to life; others who will not return; and *Archats*, or the worshipful, who are perfectly pure, infallible, endowed with miraculous powers, and see the Nirvāna; still higher saints, of 3 sorts, according to the 3 passages or vehicles. The 3 sorts are: those having life on account of their being pupils of Sākya-muni; Pratyeka Buddhas, or self-saviours, a million times higher than Archats, comprehending all causalities; and Boddhisattvas, a sort of embryonic Buddhas. The 3 passages or vehicles are represented as being drawn, the little by antelopes, the middle by goats, the great by oxen. Buddha himself is represented to have been thrice as great in body as ordinary men, of the most majestic beauty of appearance, with 82 great and 80 lesser characters of physical perfection, with a protuberance on the head, with bluish-black locks flowing like a periwig, a tuft of hair between the brows, &c. His footsoles are marked with various emblems, such as a wheel with many spokes, an umbrella, an elephant's trunk, a lotus, mount Meru, the sun, moon, tiger, mystic crosses. The atmosphere about him is aromatic, his head is surrounded by a halo of light.—Buddhism favored the laity by admitting them to salvation, and binding them to the priests. *Upāsakas* and *Upāsakis* (*upa*, before; *asa*, to be) are male and female religious servants, a sort of half monks and half nuns; bound to observe the first 5 of the above 10 precepts, with the following 5: not to swear or curse, not to talk nonsense, not to be concupiscent or greedy of pleasure, not to be malignant, to eschew superstition, heresy, and scepticism. In short, the whole morality is more one of endurance, of patience, of submission, and abstinence, than of action, of energy, of enterprise.

A general love of all beings is its nucleus; each animal being our neighbor or possible relative. To love even our enemies, to offer our lives for animals, to abstain even from defensive warfare, to gain the greatest of victories by conquering oneself, to avoid all vices, to practice all virtues of humility and mildness, to be obedient to superiors, to cherish and respect parents, old age, learning, virtuous and holy men, to provide food, shelter, and comfort for men and animals, to plant trees on the roads, dig wells, &c.—such are the moral duties of Buddhists. No religion is despised by them, religious wars waged against dissenters have never been heard of among them; the only contest on record being that between the Tibetan Yellow and Red caps, in which the latter were driven out into the high valleys of the Himalaya (Blantia, Nepal, Ladakh, &c.) "Honor your own faith, and do not slander that of others," is a Buddhist maxim. Kublai-Khan, who became a convert in 1259, allowed priests of all creeds to "swarm at his court," who were eager to convert him to their own faith. The persecutions of Christians in Japan, China, Siam, &c., are occasioned by other than religious causes, being commonly reprisals against their interfering habits. National barriers have been most effectually levelled to the ground by Buddhism. Polygamy is not countenanced, but merely tolerated where it had existed before Buddhism came in. Monogamy is the rule in Ceylon, Siam, Burmah, somewhat less so in Tibet, Mongolia, and among the Calmucks. What we call illegitimate children are not disowned or abandoned, but taken care of, although they have no equal right of inheritance with the strictly legitimate. Woman, in general, is better treated than by any other oriental religion. In the cold, high regions of Tibet, and in the Himalayan valleys, polyandry is not rare, several (sometimes as many as 10) men, mostly brothers, having but one wife.—Worship, in our sense of the word, arose slowly and late in Buddhism. Almsgiving, confession, preaching, explaining the reasons for the inequality of fortune, and other relations between the clergy and laity, produced, at last, the use of prayers, of adoration, and of sacrifices. The memory of Sakya-muni, his pretended image, his relics (afterward those of others), became objects of idolatry. Buddha is said to have made a portrait of himself, which became the stereotype model of an infinity of images, statues, and the like. The ancient Buddhist paintings in fresco, as found in grottoes, are highly creditable to the taste and skill of the painters, who were mostly monks. Three sorts of relics of Buddha and of saints are distinguished, viz., bodily *skatas* (elements) or scories (*vet*, to injure), such as teeth, hairs, nails, pieces of bones; things once possessed by the saint; and objects with which he came into contact. The most renowned of relics is Buddha's left eye-tooth, the present palladium of Ceylon, whose history is quite romantic and miraculous. It is a

piece of best ivory, about 2 inches long, kept in a splendid chapel and surrounded by many jewels. Buddha's skull, eyeballs, slender blade, &c., his manuscript of the Dharmae, his gown, alms-pot, &c., his shadow, heaven-ladder, his actual bodies, as bird, elephant, &c., the Buddhists at Gaya, and many other relics, are shown in various places. Relics are kept in stupas or *stupas* of peculiar construction; the shape of a water-bubble, and one or several umbrellas being characteristic and symbolic features of these monuments, among which the celebrated porcelain pagoda of the convent of celestial beatitude at Nanking is the principal. Most have cupolas; but some, like the *Souryghans* of the Mongols, are pyramids, or only truncated pyramids. Their height is from a few inches to 500 feet and more. Most of them contain a small cavity, in which the relics are kept; but some are solid. A trinity, called *Trefoetus* (3 jewels), was at last developed in the less than antient Buddhism, probably the prototype of the Brahminic *Trefoetti*, but certainly a personification of the ancient *hemala*, "Buddha, Dharmma (law), and Sangha (collection)." We know the 2 *hemet*. Sangha is the collection or congregation of saints, or what we call the church or the council; but at last it came to mean simply the priesthood. Since the priesthood was the representative of Buddha, and the expounder of the Dharmae, it became itself the whole trinity, and even God; though in pure Buddhism no God is mentioned. The original formula of a prayer: "I take refuge with Buddha, I take refuge with Dharmma, I take refuge with Sangha," is repeated mechanically *ad infinitum* by the aid of the beads; the movement of the Beas being sufficient to render it efficacious. At last praying machines were constructed, consisting of a sort of hollow barrel, which turns on an axle, and in which the prayer, written on a great many little scrolls, is turned about like coffee in a roaster. Fa-hien, the Chinese pilgrim, describes (A. D. 400) some which he saw. Some are manual, and moved by wind or water, or by special turners, or merely kicked into motion by passers by. Magic formulas of exorcism, storm-making, raising from death, &c., remnants of ancient Shamanism, have been engrafted upon Buddhism amongst the Mongols and Calmucks. Sermons have also become an integral part of worship, as also processions around temples or stupas, with relics; sacrifices of fruit, flowers, incense, eatables (not bloody); confession of sins, consecration of sacred water, sacred baths or baptisms (in Mongolia), fastings, psalm-singing, chorals, benedictions, litanies. The Lamas are dressed in pontificals, like those of the Catholic bishops. The temples are square, with a nave and lateral halls, separated from it by columns. Opposite the entrance is the sanctuary with the altar, and images of saints. In some there is a dagaba under a cupola. Paintings, banners, garlands, tapestries, allegoric representations adorn the church. There are 2 altar table-

ments: an umbrella, a horn, crosses entwined in a knot of 24 angles, a lotus-flower, a gold-fish, a ewer, a wheel, an allegory of 5 senses; all symbolic of Buddha, and made of pasteboard or of metal, varnished, gilt, and painted. On the altar are sacrificial shells, sacred vessels, a metallic mirror to reflect Buddha's image, a round plate with 5 protuberances, representing the Meru and the 4 Dvipas or quarters of the world, and a chalice. Fumigations, illuminations, music, bell-ringing, and many other things similar to those used in the west, attend the rites. Beside the festivals at the new and full moon, and some others in different countries, there are 3 great annual festivals. One is called the lamp-festival at the close of the *Varsha*, or rainy season, our autumn; there is another at the beginning of spring; one on the day of the conception or birth of Sakyamuni, whose time varies in different countries. There is also, in some parts, a 4th festival, when the images of Buddha and of the saints are carried about on wagons; and in the north a 5th, is that of the consecration of water, rivers, lakes. The Lamas also say masses for the repose of souls. Synods are held annually and quinquennially; the latter, in olden times, on the sacred plain at the confluence of the Ganges and Jumna, called the great alms-field. Family-worship takes place at different stages of life, such as birth, naming of the child, hair-cutting at puberty, marriage (though this is merely a civic and not a religious act), death, funerals; at all of which the priest is present, although not necessarily as in Europe. The priest acts also as a physician, and in the north as a sorcerer, magician, augur.—*Samādhi* (*sam*, together; *dha*, to have hold), or meditation, for the sake of arriving at the extinction of the selfhood in the manner described above, is the acme of spiritual life. It consists of 4 degrees: 1, consideration of one thing as distinct from others, with satisfaction at the discernment of multifarious things; this frees one from the conditions of sin; 2, suppression of that discerning judgment, reduction of the many things to one; with pleasure thereat; 3, indifference in the discernment by judgment; memory and consciousness yet active, with a dim feeling of bodily well-being; 4, complete indifference, purification from all feeling of joy or pain. Nothing can resist contemplation, and the Bodhisatvas thereby reach the 28th heaven. There are theories concerning 108 Samādhis. Over the 28th heaven there is yet Nirodha (*nī*, before; *rudha*, to oppose), or the obstacle, before the Nirvāna can be attained. Whether this obstacle necessarily ends life, is not yet ascertained. The fruit of Samādhi is *Djāna*, science or omniscient omnipotence, containing the *Moksha* or final liberation. III. The ABHIDHARMA (*abhi*, over, upon, and *Dharma*) constitutes Buddhist metaphysics, and is derived indirectly from Sakyamuni. The southern Buddhists say: "Sutras are for men, Vinaya for priests, Abhidharma

for gods." There are but 2 sources of knowledge; sensual perception and logical deduction. There are 2 principal philosophic schools: 1, that of the *Vaiśhāṣikās*, or dilemmists, who maintain the necessity of immediate contact with the object to be known; 2, that of the *Sautrāntikās*, who insist on perception and on deduction therefrom. Some among the former reject the existence of the world. Buddhist logic is exceedingly contradictory. Each determination ends in naught. To be is said also not to be. A common formula of arguing is this: "A thing is and is not, and it neither is nor is not." The method is purely dogmatic and dialectic, proceeding with stereotyped categories and formulas. Philosophy, cosmology, and theology, are an overturning wheel without any locomotion. In general, the wheel and water-bubble are the constant emblems and symbols of Buddhist reasoning, which is most developed in the theory of the "great passage." Matter is merely a product of morality. Some schools count 5 elements, with as many qualities and senses; some have 6, viz.: earth, hard, nose; water, wet, tongue; fire, hot, eye; air, movable, skin; ether, audible, ear. To these is added the *Manas*, or common sensorium, whose objects are the *Dharma* (law, being, nature matter), and the *Vidjāna* (science, conscience). Some systems admit a specific soul or self (*Jīva Atman, Upadhi*); others deny it. It is needless to enter into further details, and we conclude with a list of the following chain of 12 causes (*Nidhānas*; *nī*, in, on; *dhā* to possess): 1, age and death; caused by 2, birth; caused by 3, existence; this by 4, attachment to things; this by 5, desire; arising from 6, sensation; which presupposes 7, contact; this 8, senses; which perceive 9, forms and names or distinction; caused by 10, conception of ideas or consciousness; which comes from 11, stirring and action: this being, at last, the result of 12, *Avidya* (*non* and *viders*), or ignorance. All these illusions must be annihilated before we can sink into the emptiness of the Nirvāna.

BUDDING, a method of propagating trees and shrubs. It is now well understood that the seeds of cultivated fruits, when planted, seldom produce trees bearing fruit true to their kind. Young trees, grown from seeds, are called stocks. They are removed from nursery beds when in a thrifty state, with well-ripened wood, set in regular nursery rows in good ground during early spring, and in summer worked with choice buds from fruit trees. Large trees are frequently remodelled by the inoculation of some of the thrifty young shoots with buds from more desirable varieties of fruit than their natural product. A tree is composite in its character. Each bud may be made a separate individual; it is a point of vitality, and sends out its delicate rootlets of woody fibre, burying them in the rich soil of the branch on which it is borne, at the first awakening of the dormant tree in early spring; just as a seed under

the influence of warmth and moisture, when placed in the soil, develops the little germ which sends its roots to feed in the mould by which it is surrounded. When a bud is carefully removed from a tree, it bears all the characteristics of that tree, and when properly set in a thirty young stock will unite with it, and produce a tree similar to the one from which it was removed. The results produced by budding are the same as those brought about by grafting; but the former has many advantages, as follows: 1. Stocks may be budded at an earlier age than they can be successfully grafted. 2. Stocks may be budded the same season they are transplanted, while they should not be grafted until the ensuing season. 3. Budding is a more rapid operation than grafting; a slow workman being able to set 2 in a minute, and frequently 1,500 to 2,000 are set in a day, where a bud is allowed to tie on the base matting to protect the bud. The work is also done at a season when there is not so much hurry as in the spring, when grafting is performed. 4. If a tree be budded during summer, and the bud dies, the operation may be repeated the same season, or the stock grafted the ensuing spring; whereas, if it be grafted first, it may be entirely lost. 5. Very choice trees may be rapidly propagated by budding, one bud being sufficient to reproduce the variety, while in grafting several buds are used at once.—For budding, a sharp, thin-bladed, round-pointed knife, with a handle terminating in a thin wedge-like piece of ivory or bone, which is useful in raising the bark of the stock, good stocks, good buds, and bass matting for tying, are required. The process of budding, though simple, requires a dexterous hand. The buds are taken from shoots of the present year's growth, when they have become pithed; this may be known by the formation of the terminal bud. Should the shoots be backward in growth, they may be more rapidly perfected by pinching off the upper end, shocking their growth, and ripening the parts. The buds to be removed are developed in the axils of the leaves, or that point where the leaf joins the stem. The buds should be well formed before being removed, or they will be of no value. When of proper age, the young shoot from which the buds are to be taken is cut away with a sharp knife, the leaves are removed from it, while their foot-stalks are left attached to the buds as handles. The removed shoot is then called a "stick of buds." They may be wrapped in damp cloths and laid in a cool place for several days, if necessary; or they may be packed in moist sawdust to exclude the air, and thus sent a long distance with perfect safety. When the operator is ready, he selects a smooth place on the stock, making an incision across it through the bark, and another at right angles to and below it, so as to form a T; the bark is raised on each side of the cut by the ivory handle of the budder's knife, and the stock is ready. Taking the stick of buds in his left hand, the operator inserts his knife above the

bud, bringing it out below, so as to cut away the bud, a portion of bark, and a part of the wood. Some budders are particular to remove this bit of wood, so as to expose the root of the bud to the surface of the wood of the tree, while others are not particular, so long as they secure a wide surface of bark around the bud to attach to the wood of the stock. It is a very nice operation to remove the wood successfully. Mr. P. Barry says, in his "Fruit Garden:" "When it happens that the knife passes exactly between the bark and wood, the bud cannot fall to be good; but this rarely happens; more or less wood is attached, and the removal of this is the nice point. Where the buds are flat, the difficulty is less than when they have large, prominent shoulders, as the plum and pear have in many cases. When all the wood is taken out of these, a cavity remains which does not seem in contact with the wood on which the bud is placed, and therefore, although the bark unites well, the bud will not grow. Sometimes such as these are separated by making an incision through the bark, lifting the edge of the bark attached to the bud with the knife, and pushing it off with the fingers. A safer way still is to cut around the bud and draw a strong silk thread between the bark and the wood, thus removing the bud in perfection." Mr. J. J. Thomas says, in his "Fruit Calendar:" "The English practice of taking out the small portion of wood cut from the shoot, has been found, in the climate of this country, not only useless, but really detrimental. Indeed, it often happens that buds of the cherry and other trees of rather spongy growth and slow adhesion, succeed much better when a thick portion of wood is taken off than otherwise; the wood in such cases assisting in the retention of moisture until cemented to the stock." Having prepared the bud, insert it quickly in the incision on the stock, and commencing at the bottom wrap the bud and stock with strips of bass matting, merely leaving the vital point of the bud exposed, and making the whole impervious to air and water. The bud will soon swell, when the tie should be loosened, and finally removed. This will happen in from 10 to 20 days. Should any length of time elapse from the removal of the bud to its insertion, it should be held in the mouth to keep it moist.—The time for budding is usually from July 15 to Sept. 15. The only rule that can be given is, to secure the perfect development of the bud, and to ascertain that the bark of the stock separates freely from the wood. This will occur earlier or later, according to the kind of tree, location, and season. The inserted bud will remain in the stock in a dormant condition until the ensuing spring, when the top of the stock is removed a few inches above the bud; thus the latter receives the whole sap of the stock, and when a shoot is produced it is stayed by being tied loosely to the stock left above the insertion. Later in the growth of the tree the stock is cut down to the base of the new shoot, which rapidly heals the wound, and the young tree becomes

a true representative of the variety from which the bud was originally derived. Budding is sometimes performed in spring, sometimes in June, but these are not desirable periods.—Anchor budding is a new method, which has some advantage over the old process. Instead of making a cross incision so as to form a T, cuts are made from the upper end of the vertical incision at a slight angle, so that the whole is shaped like an anchor ∇ . The bark may be more readily raised from the stock than in the old method. Mr. O. G. Paige, of Washington, D. C., recommends this method as the best.

BUDE (BUDÆUS), GUILLAUME, one of the most learned Frenchmen of the 16th century, born at Paris in 1467, died Aug. 24, 1540. He revived in France the study of the Greek language, which he had learned under Johannes Lascaris; was appointed by Francis I. royal librarian and master of requests; and it was chiefly by his counsels that the college of France was founded.

BUDE LIGHT, the name given to the method of increasing the light of coal gas, or of argand burners of lamps, by introducing oxygen gas into the interior of the hollow flame. The process was contrived by Mr. Goldsworthy Gurney, of Cornwall, England, and called Bude light from the name of his residence. The materials consumed to produce light burn to waste in the ordinary hollow flame; only the outer portion of this is exposed to the oxygen of the atmosphere, and the gases in the interior are carried off only partially consumed. By directing a current of oxygen gas upward through the internal cavity of the flame, all the gases meet the full supply of this element, and thorough combinations take place, with greatly increased vividness of light. This principle has been introduced into the English house of commons, with the most satisfactory results as regards economy and efficiency of the light produced, and its agreeable effects. The gas furnished to the city of London is of such inferior quality, that it is found well to purify it and improve its illuminating property by passing it through naphtha. Oxygen is produced by heating black oxide of manganese in retorts set in a furnace in a vault of the building; this gas is conveyed through pipes to a gasometer, from which extend other pipes, with a branch leading into the centre of each burner. The house of commons was formerly illuminated with 240 wax candles, placed in different parts of the apartment—an exceedingly ill contrived and expensive arrangement. By the adoption of the Bude light the expense is reduced $\frac{1}{3}$, while the light is far more brilliant and agreeable to the eye, more nearly resembling daylight than any other artificial light. Even with the extra expense of the naphtha process, which is probably only necessary in the use of the London gas, the application of the oxygen is not attended with any increased expense, when the additional amount of light obtained without extra consumption of gas is correctly calculated. It is a process, how-

ever, that can only be advantageously conducted upon a large scale. According to the quantity of oxygen supplied, the color of the light may be made to vary from the most perfect white to the red hue.

BUDGELL, EUSTACE, an English writer and friend of Addison, born in 1685, at St. Thomas, near Exeter, died in 1736. He assisted Steele in the composition of the "Tatler," and Addison in the "Spectator," where his contributions are distinguished by the signature X. In 1717, Addison obtained for him the place of comptroller general of the revenue in Ireland. He lampooned the Irish viceroy, and was removed from office, and in 1720 he lost all that remained of his fortune in the South sea scheme. Soon after this a legacy of £2,000 was left him in the will of his friend, Dr. Tindal; but Budgell was accused of having interpolated this passage into the will, and the legacy was annulled. He finally ended his life by leaping from a boat into the Thames.

BUDGET (Fr. *bougette*, a bag), an official statement respecting the annual income and expenditure of a nation. In the parliamentary parlance of England the term refers to the financial statement of the chancellor of the exchequer. As a matter of mere amount, the greatest budget ever proposed was that providing for the British expenditure during the late Russian war, at the rate of \$425,000,000 per annum.

BUDGETT, SAMUEL, an English merchant, as eminent for piety as for business talent, born at Wrington, July 27, 1794, died in Bristol, April 29, 1851. The son of a trader, he received little education at school, but began early to receive in his father's store lessons for his future practice. At 7 years of age he removed with his parents to Kingswood, and 2 years after to Coleford, where he began to display his mercantile predilections, and, with a habit of mind which always remained to him of deducing general principles from particular facts, inferred from an incident that self-interest is the mainspring of human actions, and determined in all his future dealings to be able to present a case which should convince men that their interest lay in purchasing from him. He began his apprenticeship in a commercial house in 1809, and at the age of 23 years went into partnership with his elder brother at Kingswood Hill. The energy of the new merchants, and the fact that their business was conducted on the system of cash payments, gave them rapid and sure success, and they soon had several establishments in Bristol, dependent upon the central one at Kingswood Hill, and were among the most extensive general merchants in the western part of England. In 1835 the elder brother retired from the firm, and the business was prosperously continued by Samuel Budgett till his death. He was an earnest member of the Wesleyan church, and was distinguished for his unvarying religious character, and for his admirable and Christian management of the

numerous men in his employ. Though as a master he required neat and industry, and though an idle hand was sure of immediate dismissal, yet he was familiar in intercourse with his men, interested himself in their moral welfare, distributed regular rewards for personal attendance, invited them all to supper at appointed times, and gave them an annual business fête with dinner, tea, and athletic and useful games. The habit of assembling all hands for daily prayer existed in his establishment from the beginning.

BUDNIEUS, or **BURER SIMON**, a Polish divine, died in 1584, the founder of an early Protestant sect, which denied the divinity of Christ, and which disseminated its theories in Lithuania, Russia, Poland, and various other northern countries. His followers were called after him the Budnieus, but subsequently he and they coincided with the Socinians. His Polish translation of the Bible was published in 1579.

BUDOS-HEGY, a mountain in the E. part of Pennsylvania, belonging to the Carpathian range. It rises in the form of a steep, isolated cone to the height of 7,840 feet. On all sides of its base lie valleys, and for some distance up it is clad with dense forests. It has numerous caverns, which exhale sulphurous vapors.

BUDUN, 6 deities of Ceylon, who are believed to have begun as insects, and to have arrived at divinity through many transigrations.

BUDWEIS, or **DEPWITZ**, a fortified town of Bohemia, on the Moldau; pop. 8,730. It contains a cathedral, a handsome council-house, several institutions of learning, flourishing manufactures of woollens, muslins, damasks, &c. The railway which connects the town with Linz was the first one built in Germany.

BUEL, Jesse, an American agriculturist, born at Coventry, Conn., Jan. 4, 1778, died Oct. 6, 1830. He learned the trade of a printer, and established the "Albany Argus," a journal which has had a powerful influence upon the politics of New York. Mr. Buel closed his connection with it, however, in 1820, and retiring to a farm in the neighborhood of Albany, upon the verge of that elevated and sandy plain which stretches nearly 20 miles to Schoenestady, devoted himself to agriculture. The land which he had chosen for his residence, as well as the tract of a similar character surrounding it, had been found almost worthless under the system of cultivation hitherto pursued; but by fertilizing substances appropriate to the soil, and by deeper and more perfect tillage, he not only made it one of the best farms of the state, but gave an example of great value to others. He was frequently a member of the state legislature, and at one time had a seat on the bench of the county court, from which he derived the title of judge, by which he was generally known. In 1824 he commenced the publication of the "Albany Cultivator," which he edited for 6 years, diffusing in that time a vast mass of important information upon agriculture in all its

branches, and the mechanical arts necessary to it. He wrote also the "Farmers' Instructor," and the "Farmers' Compendium." In addition to these publications, he delivered an immense number of addresses upon one or another branch of his favorite subject in almost all parts of the United States.

BUEN AYRE (*Buenavista*), a small, irregularly shaped island in the Dutch West Indies, used as a penal depot; pop. about 2,000, $\frac{1}{2}$ slaves. It lies N. E. of Curaçao, about 30 miles distant. It is a highland, sloping to the S. W., on which side there is a very good roadstead. The principal trade of the island is in salt, of which about 65,000 to 70,000 bbls. are annually exported. Cachaoua is also exported.

BUEN RETIRO, formerly one of the 2 great palaces of Madrid, built on an elevated ground at the extremity of the city. The first structure was erected by Philip IV. under the guidance of his minister Olivares, but large additions were subsequently made, with more regard to splendor than congruity. During the invasion of Spain by the French, in 1808, the Buena Retiro was selected by them as a commanding position from which to terrorize Madrid, and the result was its ruin.

BUENA VISTA, a hamlet in Mexico, 7 miles S. from Saltillo, in the state of Coahuila, famous for the battle fought near it, Feb. 22 and 23, 1847, between the American army under Gen. Taylor, and the Mexican forces under Santa Anna. Gen. Taylor had defeated the Mexicans at Palo Alto and at Resaca de la Palma, had forced the surrender of Matamoros, and stormed the defenses of Monterrey. He had occupied Saltillo, but was now acting on the defensive, and on Feb. 20 was encamped at Agua Nueva, 18 miles S. from Saltillo, when he learned that Santa Anna, at the head of 20,000 men, was in front of him, 20 miles distant. By 2 routes it was possible for the Mexican general to gain the rear of the Americans, and intercept their supplies and communications. Gen. Taylor, therefore, on the 21st reluctantly fell back to the strong position of Buena Vista, a section of the valley which extends from Saltillo to Escobedo, and which ranges from 2 $\frac{1}{2}$ to 4 miles in width. Rugged mountains more than 1,000 ft. in height, and inaccessible to any but light troops, enclose it on either side. The valley is crossed by a series of deep ravines cut by torrents flowing from the mountains in the rainy season, and is traversed lengthwise by a road which winds along the line of drainage and over the projecting points of the ridges. It becomes a defile $\frac{1}{2}$ mile S. from Buena Vista at Angostura, immediately S. E. of which is a broad plateau set amid a system of narrow and difficult gullies. On and around this plateau was fought the battle of Buena Vista. The American force was less than 5,000 men, while the Mexican army was probably 4 times that number; but the features of the ground were such as nearly to paralyze the artillery and cavalry of the latter, and to prevent its infantry from deriving all the advan-

tage of its numerical superiority. Gen. Taylor returned a short answer to a summons to surrender, his line of battle having been already formed. A strong battery was posted on the road at Angostura, supported by 8 regiments on the crests of the nearest ridges. One regiment, with 2 guns, was thrown westward across the streamlet, to prevent any flanking movement of the enemy in that quarter. Two regiments of skirmishers occupied the extreme left, near the base of the eastern mountains. One regiment with 8 guns was advanced upon the plateau; and in the rear of the plateau the remaining force, consisting of 2 regiments, 2 squadrons of dragoons, and 4 guns, was kept in reserve. The battle began by a shell from a Mexican howitzer, and a rapid attack by the light troops of Ampudia upon the American skirmishers on the left, with a view of gaining the eastern heights. This was the only engagement during the afternoon; and at night Ampudia had succeeded in posting himself upon the summit of the ridge, while the American regiments were withdrawn to the plain. Meantime Gen. Minon, with a strong brigade of cavalry, having passed to the rear, Gen. Taylor regarded Saltillo as endangered, and repaired to that place during the night to complete his arrangements for its defence. The orders of Minon, however, were only to fall upon the Americans in their retreat, which Santa Anna was confident of forcing the next day. At dawn of day the battle recommenced, by an attempt of Ampudia to push the advantage which he had already gained. Both the American and Mexican detachments on the left had been reinforced; and after a brief interchange of musketry the Mexican skirmishers moved across the side of the mountain to gain the American left and rear, but were considerably harassed by a few shells thrown from a great distance from an advanced American position on the plateau. Santa Anna soon after organized a general attack in 8 powerful columns, intending for the forces of Ampudia to sweep down from the mountain at the same time. Pacheco, at the head of one column, ascended the plateau against 2 regiments of volunteers, who, galled at the same time by a flank fire from a heavy battery, after a stout resistance broke and fled. The whole fire of Pacheco's column and the Mexican battery was then concentrated upon an American battery of 8 guns, which had to be withdrawn with the loss of 1 gun after every man and horse at that piece had been killed or disabled, and when the other pieces were in not much better condition. Pacheco's masses now effected a junction with Lombardini's corps, which had advanced at the base of the eastern mountains, and with Ampudia's light division, which had pressed down from the slope, and their combined strength completely turned the American position, and put the whole American force on the left to flight. Meantime Mora y Villamil had led the third column of attack against Angostura, but the American battery opened upon it with such ter-

rific rapidity and effect, that the whole mass was immediately thrown into confusion and fled in a rout. Pacheco attempted in vain to drive the small American force completely from the plateau, being successfully resisted by a force of volunteer infantry, a squadron of dragoons, and 6 pieces of the regular artillery. The contest at this point formed no small part of the battle. Obligated to desist from their attempt to come down the plateau, the Mexicans under the protection of a powerful battery began to sweep around the base of the mountain to the American rear. In this posture of the battle Gen. Taylor arrived on the field from Saltillo, the chief command having been held in his absence by Gen. Wool. On the left, 4 American regiments were in full retreat, and the whole Mexican force in that quarter was advancing. Gen. Taylor immediately took up his position on the plateau, and advanced 2 regiments of infantry, well-supported by artillery and dragoons, directly in face of the Mexicans. Without regarding the overwhelming odds against them, the companies of gallant riflemen advanced, firing with great effect into the Mexican masses. They passed with a shout the last ravine intervening between them and the enemy, reappeared in an instant close in front of the hostile lines, and poured in their shot with additional rapidity till the enemy rolled back in confusion upon the supporting forces. Meantime the Mexican cavalry, persisting in its attempt to gain the American rear, had skirted the mountains even to the vicinity of Buena Vista. It was checked by the American dragoons, but the latter being called away to operate on the plateau, it hastily returned and attacked 2 unsupported American regiments, and in the furious *mélée* which succeeded, Col. Yell was killed. The enemy escaped in season to avoid the dragoons, which had a second time appeared. At the same time a new attack made upon the American front by a fresh brigade of Mexican cavalry was repulsed. Gen. Taylor now ordered a combined attack upon the enemy's right flank near the eastern side of the valley, which was immediately carried into effect. The cannonade and musketry were directed with so much skill and vigor that the routed masses of the enemy were driven back upon the mountain. The route to the Mexican rear was in danger of being intercepted, and the destruction of the whole Mexican body in this quarter, of more than 5,000 men, seemed impending, when a white flag was borne from Gen. Taylor's position, and orders were given to stop firing. Three Mexican officers having approached the American lines for the apparent purpose of conference, Gen. Taylor sent an American officer to communicate with Santa Anna. Yet the only result of this *manœuvre* was, that it enabled the endangered Mexicans on the left to make good their escape to the south of the plateau. The conference proved delusive, and the Mexican forces now prepared to make a final struggle for the victory in a single col-

men of attack, led by Gen. Peres. The whole Mexican strength, full 12,000 men, advanced up the crest of the plateau in a blaze of musketry. They came on, unchecked by the fearful discharges of artillery which swept through them, driving the volunteer regiments in confusion and disorganization; and under their storm of shot, Clay, McKee, Hardin, and other American officers fell mortally wounded. The artillery fell back as their pieces resided, keeping up their fire upon the advancing Mexicans, and striving to hold them in check until succor should arrive from the left and rear. In this terrible and unequal contest some of the American pieces had been already captured, when the timely arrival of the other batteries saved the day. It was by the united action of all the American artillery in the field that the Mexican advance was at length stayed after the hottest part of the battle. Yet the Americans made no advance in turn, and when night fell they held only a corner of the plateau, almost the whole of which they had possessed in the morning. They lay on their arms all night, making every preparation to receive a renewed attack, but in the morning Santa Anna had retreated to Agua Nueva. The loss of the Mexicans, in killed and wounded, was about 2,000; that of the Americans, 740. The American army engaged at Buena Vista consisted in large part of volunteers, most of whom had no military experience; and on account of the unequal daring and composure displayed by them at different times the battle would have been lost again and again but for the heroic conduct of the regular artillery.

BUENA VISTA, a south-west county of California, separated from Tulare co., April 30, 1855. The Coast range forms its western boundary and the Sierra Nevada traverses its eastern part, the two ranges meeting at the southern extremity of the county. A vast extent of surface between these ridges is overgrown with rushes, and is frequently inundated. On the northern border lies Tulare lake, and in the south-western part are Kern and Buena Vista lakes, the country around which is said to be of great fertility. Kern river is the principal stream.

BUENAVENTURA, or **SAN BUENAVENTURA**, a seaport town of California, situated near the boundary between Santa Barbara and Los Angeles counties, on Santa Barbara channel. It was founded about 1792, was formerly a missionary station, has a tolerably good harbor, and is surrounded by a rich, beautiful country, remarkably prolific in many varieties of fruit.

BUENAVENTURA, a town in the department of Cauca, New Granada. It is situated on the small island of Kaseakral, near the mouth of the river Dagua, at the head of the bay of Choco. The inhabitants are mostly negroes or mulattoes.

BUENO DA SYLVA, **BARROLOMBE**, succeeded **ANANORUCA**, or **Great Devil**, a Brazilian adventurer of the 17th century, who fol-

lowed the traces of a previous adventurer, Manuel Correa, in search of the gold mines of Goyaz. He died before he could consummate his conquest, although he had satisfied himself as to the existence of the new Eldorado, and even forced some of the savage inhabitants into submission by threatening to burn their lakes and rivers, convincing them of his ability to do so by exhibiting brandy in a state of ebullition on a tin dish.—After his death his ambitious designs were carried out by his son **Barrolo-mbe**, who equipped a regular exploring expedition, under the auspices of Governor **Mezinas**. This failed, but in 1726 he undertook a second expedition at the head of an army of *bandeiros* or *fillibusters*. He now identified the places which his father had visited, seized some of the treasures of Goyaz, and returned to St. Paul with \$15,000 in gold dust. This induced the government to appoint him lieutenant-general and regent of the new province. He finally died in the greatest poverty.

BUENOS AYRES, a republic of South America, formerly a constituent of the Argentine confederation or republic of La Plata, but now maintaining an independent, though somewhat anomalous position. The state lies between lat. 33° and 41° S., and long. 56° and 71° W.; is bounded N. by the states of Mendoza, San Luis, Cordova, and Santa Fé, and the river Parana; E. by the river La Plata and the Atlantic ocean; S. by the ocean and Patagonia; W. by the Andes, which separate it from Chili. The state is of irregular form, but has an average breadth from N. to S. of 400 miles, and an average length from E. to W. of about 750. The eastern portion, lying on the ocean and the Plata, is fertile and well watered; the Salado, an affluent of the Plata and its branches, irrigate its surface. Farther west and south-west it stretches off toward the Andes in these vast plains, known to the inhabitants as *pampas*, on which for hundreds of miles no hill, rock, or tree varies the dreary uniformity of the surface. Here, in the absence of water-courses, the soil is sandy, and often barren, and covered with a saltish efflorescence. Occasionally salt lakes make their appearance, and their exhalations, with the glitter of the salt-beset plains, contribute to produce the mirage which, as in eastern climes, deludes the wayworn traveller with visions of fair fields and flowing streams. From these sandy plains a burning wind, much like the *sirocco* of the East, sweeps over the eastern part of the province, scorching vegetation, and parching the skin like the breath of a furnace. In the south-east part of the state, and on its western boundary, there are mountains of considerable height, the latter forming a part of the Andes. The principal rivers are the Salado in the east, the Negro and the Colorado in the south-west, and the Desaguadero in the west, which discharges into a salt lake called *Urre Lanquen*, in the interior. Beside this lake there are many salines scattered over

the state, which, in the rainy season, become lakes, but during the summer form extensive salt marshes. The climate in the northern part is mild and pleasant, the temperature varying from 40° to 90° F. in the year. Tropical fruits flourish to some extent in the vicinity of the city of Buenos Ayres. In the south it is colder, and ice and snow occasionally appear; but the country generally is very healthy, and the air pure and dry. The S. W. wind is usually accompanied with thunder, and during its prevalence frequent hurricanes occur. The vast pampas furnish abundant and luxurious herbage for immense herds of wild horses and cattle, the skins, hides, horns, hair, tallow, and beef of which form the chief articles of foreign export of the state. Salt is produced at some of the salines, and the city of Buenos Ayres was for many years supplied from the lake of Urre Lauquen, distant 450 miles. Since the restrictions have been removed from commerce, it has been found cheaper to import it. The country produces saltpetre, clay, iron, cotton, rice, grain, sugar, tobacco, flax, hemp, wool, ipecacuanha, fruit, wine. Among the wild animals are jaguars, martens, foxes, tapira, &c. Llamas, horses, cattle, sheep (*vicuña*), are domesticated. Serpents (including many poisonous species) abound. The most remarkable birds, are the ému, the black-necked swan, &c. In 1856 the number of cattle was 4,502,090, of horses 2,196,663, and of sheep 7,966,725. — Buenos Ayres shook off the Spanish yoke in 1810, and in connection with the adjacent states formed a confederation, known as the republic of La Plata, or the Argentine republic. But the ambition of the state of Buenos Ayres to secure to itself the lion's share of the advantages of a confederation, led to repeated changes, and the states were sometimes isolated and independent republics, or rather anarchies; at other times confederates like the United States; at others still, merely in a state of alliance. During the administration of Rosas (1835-'52) they were virtually allied, though not without occasional rebellions, and his efforts were directed to the aggrandizement of the state and city of Buenos Ayres, at the expense of the other states and countries of the confederation. The final separation from the Argentine confederation took place in 1853. A new constitution was framed in Sept. 1854, liberal in its general tendencies, establishing the freedom of the press and the independence of the judiciary. (See ARGENTINE CONFEDERATION.) The predominant religion is Roman Catholic, but all creeds are tolerated. The national independence of Buenos Ayres was recognized by several countries in 1855, most of which, however, have since withdrawn this recognition, and now maintain diplomatic relations only with the Argentine confederation. Dr. Valentín Alsina has been governor of Buenos Ayres since 1857. Receipts in 1855, \$3,000,000; in 1856, \$3,400,000. Expenditures in 1854, \$2,500,000. Public debt, with interest, domestic, \$925,000; English loan (£1,750,000), \$8,-

750,000; in paper money, without interest, \$5,250,000; total, \$14,925,000. Standing army, 6,370 men. Naval force, 8 steamers, 2 corvettes, and 4 inferior boats. Pop. of Buenos Ayres in 1856: Northern district, 58,844; western district, 66,134; southern district, 82,877; rural pop. 202,855; pop. of the city of Buenos Ayres, 101,000; total in 1856, 803,855, of whom not far from 40,000 are Europeans, and a large proportion of the others Indians and mixed races. The population, in round numbers, is estimated by some authorities at 400,000. Our estimate, however, which is based upon the census of Oct. 1855, is probably the most correct.

BUENOS AYRES (*Ciudad de Nuestra Señora, Ciudad de la Trinidad*), capital of the above-described state, situated on the S. W. shore of the estuary called the Rio de la Plata, about 150 miles from its mouth. The estuary is here about 86 miles wide. Lat. 34° 35' S., long. 58° 22' W. The plan of the city is regular, and the streets are laid out in squares of about 500 feet, and paved with granite brought from the island of Martín García, opposite the city. The houses of the native inhabitants are built of brick, and are usually of only a single story in height, but enclose a court after the Spanish fashion. Little or no wood is used in the construction of these houses. The dwellings of the foreign residents are usually three stories in height, and resemble similar residences in this country. The principal public square, the Plaza del 25 de Mayo, has a monument erected in honor of South American independence; it is adorned with fountains, and surrounded by fine public buildings, among which are the cathedral, one of the largest and richest in South America, the bishop's palace, the hall of justice, the police office, &c. Beside the cathedral there are 15 other Catholic churches, and 3 Protestant, viz.: an Episcopal, a Presbyterian, and a Methodist, intended for foreigners. There are 2 monasteries and 2 nunneries. There are 2 colleges, a female college attached to the church of our Lady of Mercy, and a college for young men, attached to the church of St. Francis, and which might, with propriety, be called a university, since it includes also a department of natural history, with a very fine museum, an observatory, a normal school, a mathematical school, and a school of painting and drawing; its library contains over 80,000 volumes. There are several literary and scientific societies in the city, among which may be named a philosophical, a mathematical, and a medical society; an association of jurisprudence, and an agricultural society; that of the friends of the natural sciences is the most important. There are several journals published at Buenos Ayres which are conducted with ability, but with a strong partisan bias. One of them, *La Prensa*, gives occasionally interesting accounts of the new settlers, mainly from Germany and Switzerland, to many of whom the great rivers of the Argentine states offer greater attractions than the inaccessible inland districts of Brazil. The chari-

table institutions are, a general hospital, and a foundling hospital. The fort is an imposing structure, and contains most of the military offices. There is also in the city a military depot, called the Retiro, capable of receiving 3,000 soldiers. The hall of representatives, built in imitation of the capitol at Washington, and the custom house, are the only other public buildings particularly worthy of notice.—The commerce of Buenos Ayres is rendered difficult by the shallowness of the Plata in the vicinity of the city, and the want of a good and commodious harbor. Vessels drawing more than 12 feet of water cannot come nearer than 6 or 7 miles, and their cargoes must be brought to the city on bullock carts, or by lighters. The south-eastern winds endanger vessels in the harbor, by the violent surf which they create. The inner harbor is shoal, and only large enough to accommodate the coasting trade. Yet with all these drawbacks the commerce of Buenos Ayres, as the principal port of entry for the states of the Argentine confederation as well as for Paraguay, is large and constantly increasing. The inland trade carried on between Buenos Ayres and Peru and Chili, is very considerable. The finest tobacco, sugar, wax, Paraguay tea, &c., are brought from the interior, and the foreign trade is daily becoming of greater magnitude. The tonnage which entered the port in 1843 was 105,238, and that which cleared, 84,117. In 1849 the clearances were 110,984 tons, of which 22,469, or $\frac{1}{5}$, were for the United States. Vessels entered in 1855, 619; in 1856, 607; cleared in 1855, 332 with freight, and 260 in ballast; in 1856, 858 with freight, and 193 in ballast. We subjoin also a table of the trade of 1855 with the different parts of the world:

Imports from	
Great Britain.....	\$4,860,000
France.....	2,500,000
Northern Europe.....	2,500,000
Gibraltar, the Mediterranean, and Spain..	64,000
United States.....	1,000,000
Brazil and other countries.....	1,188,000
Total.....	\$11,304,000
Exports to	
Great Britain.....	\$3,239,454
United States.....	3,244,844
France.....	2,151,862
Belgium.....	1,510,718
Spain.....	1,358,132
Cuba.....	828,384
Italy.....	987,152
Brazil.....	925,060
Chili.....	293,524
Hamburg.....	223,707
Holland.....	115,237
Other countries.....	52,914
Total.....	\$15,260,936

Exports from Buenos Ayres and Uruguay to Great Britain:

	From Jan. 1, to May 1, 1857.	Same period, 1858.
Hides, number.....	25,453	4,915
Tallow, cwt.....	5,150	1,294

Imports from Great Britain into Buenos Ayres:

January 1 to April 1, 1857.....	\$1,400,000
“ “ “ “ 1858.....	1,370,000

Exports from Buenos Ayres and Argentine re-public (through Buenos Ayres) to France in 1857.....	\$2,993,553
Imports from France to Buenos Ayres, &c., 1857.	8,695,091

In 1854, owing to the anarchical condition of the country, the clearances for the United States were only 12,914 tons, and the entries from that country, 10,356. In 1857, with a more quiet and peaceful condition, trade had revived, and the commercial intercourse with the United States, which had formerly been carried on mostly in foreign bottoms, was almost entirely conducted in American vessels. The tonnage of that year, entered at the port from the United States, was 23,235, while that which cleared for the United States was 16,872, showing an increase of tonnage entered from the United States of more than $\frac{1}{3}$ in 3 years. The imports of Buenos Ayres from the United States the same year were \$1,313,807, while its exports to this country were \$2,784,473. She received from us lumber, bacon, lard, flour and other breadstuffs, rice, sugar, hops, spirituous liquors, spirits of turpentine, household furniture, carriages, boots and shoes, nails, ironware, drugs, cotton goods, paints, tea, spices, matting, cordage, twine, and a trifling amount of manufactured tobacco. Her exports were almost entirely confined to the raw materials of commerce, as her manufactures consist only of the most simple articles. The following table exhibits the principal exports to the United States in 1857, with the value of each:

Articles.	Quantities.	Value.
Specie, gold.....	\$10,400
Copper and tin, in pigs and bars.....	80,351
Leather tanned and dressed, doz. skins.....	1,551	9,159
Hatters' furs.....	25,963
Raw hides and skins.....	1,752,671
Hair unmanufactured.....	191,497
Wool, pounds.....	5,758,519	694,736
Nutmegs, ".....	801	553
Tallow, ".....	16,233	1,103
Rags, ".....	91,513	1,705
Unmanufactured articles.....	85,683
Total.....	\$2,783,330

—The city is poorly supplied with water and fuel; the wells are all brackish, and there are few or no public cisterns; the river water is good, but is carried around in butts, and sold at a very high price. The wealthier citizens have tanks and cisterns on their premises, in which they collect rain water. The fuel is coal brought as ballast in English vessels, and the refuse wood from the fruit plantations established on the islands in the river, by the Jesuits, in the 16th century. From these plantations, covering over 20 miles of surface, the city is also supplied with fruits, and particularly oranges, peaches, and lemons. The procuring fruit and fuel from these sources is not unattended with danger, as the plantations are infested with panthers. The environs of the city are very beautiful, being occupied mostly by the country seats of the wealthy inhabitants. The climate is dry and bracing, and very healthy. Living is very cheap. Meats are especially low, the best beef being sold at

from 2 to 3 cents per pound.—The city dates from 1580, at which time it was founded by Don Juan de Garay. In 1776 it was made the seat of the viceroyalty, and in 1778 the port was partially thrown open by the Spaniards. The repeated reverses it has met with in the last 20 years have materially interfered with its growth and prosperity, rendering property insecure, and almost annihilating its commerce; but since 1852, its trade has greatly revived, and its population increased. Population in 1856, 101,000, and since then variously estimated from 100,000 to about 150,000; owing to the fluctuation of the foreign population, the French and English alone, numbering not less than about 25,000.

BUFF, a mixed color, something between pale pink and pale yellow. It was adopted by the English whig party, in combination with blue, as their distinctive color; and, possibly in consequence of that circumstance, the whig party having been opposed throughout to all the measures of government which led to the American revolution, was chosen as the national uniform of the United States at the commencement of the revolutionary war.—**BUFF LEATHER**, a strong soft preparation of bull's or elk's hide, which was worn under the mail armor of the middle ages, to deaden the effect of a blow, which might drive in the pliable rings, so as to inflict a painful contusion. As armor fell into disuse, buff coats, which, if of the best quality, would turn a broadsword cut, and even a pistol ball, were often worn in lieu of complete steel, either with or without a cuirass and gorget of metal. The buff coats of the time of the commonwealth were often lined with white or tawny satin, and splendidly laced with gold or silver. The name is, of course, derived from its color. Modern buff leather, of which soldiers' crossbelts and other accoutrements are ordinarily made, is for the most part made of common buckskin.

BUFFALO, the name of 2 species of the true oxen, as distinguished from the bisons, to which they bear at best but a faint resemblance, though they are included with them in the genus *bos* (Linn.) The general characteristics of the buffalo are conical horns, inclining successively outward, downward, backward, upward, and forward, with their tips on a plane above and a little in front of the top of the forehead; forehead convex, and longer than broad; the intermaxillary bones elongate, shelving back, and giving prominence to the nasal bone. This animal must on no account be confounded with the American bison (*bos Americanus*), which is almost universally called the buffalo, as its furry hides, prepared by the Indians, are called buffalo robes. The 2 species of the true buffalo are the *bos bubalis* (Linn.) of India, and the *bos Caffer* (Sparm.) of South Africa. They are called, on both continents, simply the buffalo, but are separated zoologically as the Indian and Cape buffalo. In India, the buffalo is again subdivided into the tame and the wild, although

they are both of the same species. Mr. B. H. Hodgson, who has done much for the zoology of British India, thus speaks of them: "The bhainsa, or tame buffalo, is universal in India. The arna, or wild buffalo, inhabits the margins rather than the interior of primeval forests. They never ascend the mountains, and adhere, like the rhinoceros, to the most swampy sites of the districts they inhabit. There is no animal upon which ages of domesticity have made so small an impression as upon the buffalo, the tame being still most clearly referable to the wild ones, frequenting all the great swampy jungles of India. The arna ruts in autumn, gestating ten months, and produces one or two young in summer. It lives in large herds, but in the season of love the most lusty males lead off and appropriate several females, with which they form small herds for the time. The wild buffalo is fully $\frac{1}{2}$ larger than the largest tame breeds, measuring $10\frac{1}{2}$ feet from snout to vent, and 6 or $6\frac{1}{2}$ feet high at the shoulders, and is of such power and vigor as by his charge frequently to prostrate a well-sized elephant. It is remarkable for the uniform shortness of the tail, which does not extend lower than the hock, for the tufts which cover the forehead and knees, and lastly for the great size of its horns. They are uniformly in high condition, so unlike the leanness and angularity of the domestic buffalo even at its best." The arna variety is known to naturalists as the *bos arni*. Its horns, which grow out horizontally from either side of a flattened frontal bone, rise in a regular crescent upward and backward until near the point, when the tips, which are nearly equidistant with the bases, turn slightly forward. The bases of the horns, which are flattened and deeply corrugated in irregular rings through $\frac{1}{4}$ of their length, and smooth only at the points, often measure each upward of 18 inches in circumference, while their length, taken along the outer curve, has been known to exceed 5 feet in either horn, and to include a distance of 10 feet from tip to tip. In no respect does it differ from the bison more than in its covering, which consists of smooth, short, thin hair, resembling the bristles of a hog more than the coat of the ox family. It is much addicted to wallowing in the mud, is a fierce and vindictive animal, and in its native jungles is more than a match for the Bengal tiger, which never dares to attack it unprovoked. This buffalo was introduced into Egypt, Greece, and Italy during the middle ages. Its great strength makes it peculiarly adapted for draught; its milk is good, its skin highly valued, but its flesh is much inferior to that of the ox. It is a singular fact that it prefers marshy and even malarious places and coarse plants.—The *Caffer* or Cape buffalo of Africa has very large, black horns, placed close together and flattened at the base, broad, rough, and sinuously ringed, covering the whole front with a sort of horny helmet, with a smooth tip curved upward and

inward. Its horns are more horizontal in position than those of the arna, which are sometimes elevated 2 feet above the frontal bone. It has pendant ears and dewlap, skin with dark, stiff hairs about an inch long, and though of massive proportions and extremely ferocious, has neither the height nor the activity of its Indian congener. Neither species have either hump or mane, which at once distinguishes them from the bisons. The Cape buffalo is a native of all South Africa; it congregates in immense herds, but the old bulls, which become quite gray and are often almost destitute of hair, sometimes adopt solitary habits, when they grow very morose and savage, attacking both men and animals in mere wantonness, and when killed, trampling and kneeling on the carcasses and crushing them with their massy horns and frontlets, until every bone is broken. Gordon Cumming, in his South African wanderings, gives many accounts of this powerful and savage brute, which has not, however, the power of defending himself against the lion, as his Indian relative has against the tiger, but, on the contrary, often falls a prey to him by open attack. This animal also delights to wallow in the mire, like a hog, and when heated by hunting, plunges into the first water-pool, in which he wholly submerges himself, allowing only the extremity of his muzzle to protrude among the water plants and floating leaves of the nymphææ. All travellers dwell on the loud bellow which he utters in the death agony.— There is an Indian wild bull (*bos gaurus*), little known, which appears to be intermediate between the bison and buffalo. General Hardwicke and Captain Rogers describe it as a genuine bull, neither bison nor buffalo; but Major Walter Campbell, the author of the "Old Forest Ranger," who gives a full description of this rare animal, which he calls the jungle *roolgha*, makes it clearly a bison. From the character of its horns, which resemble those of the Cape buffalo in form, though they have not the horny helmet over the brow, and of its hump, supported by hump-ribs, and of its mane, it is presumed that, on further investigation, it will be elevated into a distinct genus. (See Bison.)

BUFFALO, a city and the county seat of Erie co., N. Y., situated at the eastern end of Lake Erie, and at the head of Niagara river, lat. 42° 53' N., long. 78° 55' W. It was founded by the Holland Land company in 1801, and during the war between the United States and England, in 1814, was burned by a force of Indians and British. The city was laid out by Joseph Ellicott, upon a plan which has been greatly admired. The streets are wide and straight; they generally cross each other at right angles. A few of the side streets, however, enter the principal avenue of the town, Main street, at an angle of 45°. These latter streets, crossing the others at their points of intersection, form a large number of places or squares, give variety to the outlines of the city, and destroy the monotony which would have been produced by

a rigid adherence to a rectangular plan. The city is well paved, is lighted with gas, and is supplied with water from the Niagara river. The site is a plain, which, from a point about 2 miles distant from the lake, slopes gently to the water's edge. The uplands command an extensive prospect of the lake and river, and afford beautiful situations for suburban residences. The city has no park, but there are several small public squares. Buffalo is an instance of the rapid growth so often seen in American towns. In 1814 it was a hamlet of 200 houses. The following table shows the increase in population from the year 1810:

1810.....	1,508	1840.....	19,213	1855.....	74,214
1820.....	2,095	1845.....	34,656	1853 (est'd)	90,000
1830.....	8,653	1850.....	49,764		

The increase in taxable property during 5 years has been as follows:

1858.....	\$22,537,300	1856.....	\$35,498,748
1854.....	29,973,509	1857.....	37,487,061
1855.....	33,037,711		

Total debt, Dec. 31, 1857.....\$704,535 83
Resources of the city at the same period..... 75,200 57

Buffalo was incorporated by act of the legislature in 1832. It is divided into 13 wards, each of which is represented in the common council by 2 aldermen. The legislative powers are vested in one body, the common council. The mayor is the chief executive officer. He has the veto power, and measures to which he refuses his assent must receive a 2/3 vote in the council in order to be passed. He is the head of the police; his appointments must receive the approval of the council, but he has, in certain cases, a summary power of removal. Those departments of the executive which are connected with the finances, schools, public works, and law, are independent bureaus, and the officers are elected by the people. All of these officials hold their places for 2 years. The fire department is composed of 13 engine, 3 hose, and 2 hook and ladder companies. The chief engineer is elected by the members of the department, subject to the approval of the common council.—For educational purposes the city is divided into 32 districts, in each of which there is a school. All children who reside in the district may attend without charge. In addition there is a school for colored children, and a free academy called the central school, where instruction is given in more advanced studies. Candidates from the district schools are admitted into the central school, after being subjected to a thorough examination. Two hundred and twelve teachers are employed in these schools. In 1856 they were attended by 19,093 pupils, the average daily attendance being 7,878. An officer called the superintendent of schools is at the head of this department, who appoints the teachers. This educational establishment is in every respect most admirable, and the cost of maintaining it, during 1858, is estimated at \$115,000.—The climate of Buffalo is more equable than that of any other American city in the same latitude. The winter and spring months are boisterous,

but the heats of summer are tempered by the lake winds. Owing to the salubrity of its climate, and an admirable system of sewerage, Buffalo will compare favorably with any other town in point of healthfulness. The yearly mortality is stated to be in the proportion of 1 in 50.—The United States government has lately built a fine edifice for a post-office, custom-house, and court-house. The state is now (1858) constructing a large arsenal, and the city contains 4 fine market houses; but the other public buildings are not important. The private architecture is creditable; there are many handsome banks, stores, and dwellings. The number of dwellings in the city is estimated at 10,613, valued at \$21,520,100. There are 57 churches in Buffalo, estimated at about \$1,000,000: 10 Presbyterian, 6 Episcopalian, 8 Methodist, 6 Baptist, 14 Catholic, 1 Unitarian, and others. St. Joseph's cathedral (Catholic), and St. John's and St. Paul's churches (Episcopal), are unusually beautiful edifices. St. Joseph's is in the decorated Gothic style; its shape is cruciform, and the eastern front is flanked by 2 lofty towers. It is built of blue stone, with dressings of white sandstone, and is not yet (1858) entirely finished. This church contains a stained glass window, lately made at Munich, which is the finest specimen in this department of art in the country. St. John's church is a simple parallelogram in the style of the transition from the early English to the decorated Gothic, with a square tower upon the north-west corner. It is built of blue limestone, and is worthy of notice for having an open timber roof. St. Paul's is in the early English style; the material is red sandstone, and the building is very remarkable for its picturesque appearance and for the variety of its outlines.—The university of Buffalo was chartered in 1846; the medical department is the only one in operation. This school has a fine building, and is under the charge of a corps of highly accomplished teachers. The Young Men's association is a society of citizens formed for literary purposes; any suitable person may become a member upon making application. The yearly fee is \$3. It has a library of 9,350 volumes, and the reading-room contains 57 newspapers and periodicals; a considerable collection of shells and minerals has been made, and some steps have been taken toward the establishment of a gallery of the fine arts. During the winter a series of popular lectures are delivered before this association by distinguished gentlemen from different parts of the country. The German Young Men's association, and the Young Men's Christian union, are similar institutions; some religious qualification is necessary in order to procure admittance to the last. The Buffalo female academy is liberally endowed; it is delightfully situated, and is now in a very flourishing condition. The Forest Lawn cemetery is situated in the suburbs of the city, and contains 75½ acres of land. The principal charitable institutions are the Buffalo orphan asy-

lum, hospital of the sisters of charity, female orphan asylum (Catholic), Buffalo general hospital, children's aid and reform society. The German, Scotch, English, and Irish residents, all have societies for the relief of unfortunate countrymen. There are 7 lodges of masons, 2 chapters of royal archmasons, a grand commandery of knights-templars, 2 temperance organizations, and 6 lodges of the order of odd fellows. There are 9 banks of issue, with an aggregate capital of \$2,683,091 (Dec. 31, 1857), 3 savings banks, and a trust company. In 1855 Buffalo had 265 manufacturing establishments, employing 6,848 persons, having a capital invested of \$4,000,000, and producing \$10,169,329 worth of manufactures. In 1857 the number of manufactories is stated at 450. Ship building, for which Buffalo possesses many facilities, is extensively carried on. In 1857 there were 7 ship yards, from which were launched 18,256 tons of shipping, of the value of \$1,180,800.—Buffalo is the western terminus of the Erie canal, to the construction of which the city owes its prosperity. It is likewise the principal western station of the New York central railroad. The other railroads are the Buffalo and State Line, which connects with the roads of Pennsylvania, Ohio, and other western states; the Buffalo, New York and Erie railroad, which connects with the New York and Erie railroad at Corning and Hornellsville; and the Buffalo and Lake Huron railroad, which intersects the Great Western railroad of Canada. A new road is under contract which will make a connection with Pittsburg and the coal fields of Pennsylvania, and for the purpose of facilitating railroad communication it is now proposed to bridge the Niagara river.—The principal business interests of Buffalo are those of commerce. It is the largest commercial town on the lakes. The harbor is formed by the Buffalo creek, a small stream, which is navigable for one mile from its mouth. The entrance is protected by a breakwater upon the south side of the creek, which is 1,500 feet long. A breakwater has likewise been constructed in Niagara river upon the north side of the creek, by which a new and capacious harbor has been made. In addition, there is a large number of slips and basins for the accommodation of shipping and canal boats. The entrance to the harbor and the approaches from the river are defended by a small fortification called Fort Porter, situated on the heights to the north of the city. In 1857, 242 vessels were owned and enrolled at this port, 80 steamers and 160 sail vessels, with an aggregate tonnage of 91,974 tons; value, \$3,640,950; 160,000 tons of shipping were engaged in the trade of Buffalo, nearly ¼ of the entire lake marine. The number of entrances and clearances of vessels to and from the port was 7,581; tonnage, 3,221,806. The value of imports by lake was \$36,918,166; by canal, \$47,627,526; by railroad, \$65,500,000; making a total of imports of over \$150,000,000. The exports were about the same. Grain and flour

are the chief articles of commerce. The following table of the profit, and flour reduced in wheat, received during the last 8 years, will show the extent of this trade:

1859	75,000,000 bush.	1854	20,000,000 bush.
1861	11,778,079 "	1855	25,000,000 "
1862	75,000,000 "	1856	26,000,000 "
1863	12,977,500 "	1857	26,000,000 "

Buffalo, however, is not a mere place of transshipment. The transactions in the grain market are on a large scale. In 1857, 10,052,000 bushels of grain were sold here. The trade with Canada is active; the aggregate value of exports and imports, in 1857, was \$2,258,744. The British government considered it of sufficient importance to justify the establishment of a consulate. The immense increase of the grain trade called for increased facilities for handling the cargoes on their arrival. Until 1844 the discharging of cargoes was effected in buckets; since that time it has been done by steam, which despatches in a few hours what formerly required whole days. There are now in Buffalo creek 15 elevators, with a capacity for storage of 2,350,000 bushels, elevating per hour 20,500 bushels. A new elevator, in course of erection, is estimated to store 250,000 bushels, and to elevate about 3,000 bushels per hour. The cost of discharging a cargo is 4 cent per bushel. The elevators also possess facilities for loading canal boats.—Eight daily papers are published in Buffalo, of which 3 are in the German language; 6 of the daily papers publish weekly editions, and there are 11 other weekly or monthly publications.

BUFFET (Fr. *byfèt*) was formerly a little side apartment for holding china, plate, glassware, and articles of vertu; it is now generally superseded by the sideboard.

BUFFON, a French village, department of Côte-d'Or, canton of Montbard, situated on the Armançon, 11 miles N. of Semur. The seignory of this village belonged to the naturalist Buffon, for whom it was erected into a county. It has several iron founderies and forges. Pop. 405.

BUFFON, GUYONNE LOUIS LACROIX, comte de, a celebrated French naturalist, born at Montbard, in Burgundy, Sept. 7, 1707, died in Paris, April 16, 1788. He was the son of Benjamin Lacroix, counsellor of the parliament of Dijon, and was destined to occupy the same office. He received a good education at Dijon, and made rapid progress in his studies, especially in mathematics and astronomy. At the age of 20 he made the acquaintance of a young English nobleman (the duke of Kingston), who was travelling with his tutor, and agreed, with the permission of his father, to join them in their travels and studies. They visited together many parts of France, Switzerland, and Italy, during a period of 18 months. The spectacle of nature with which he thus became familiar made a deep impression on his mind, presenting a strong contrast to the most perfect of human works in the activity of its operations and the completeness of its productions. From this time he resolved

to devote himself to the pursuit of science. He visited London with his friends, and there pursued the study of the English language, and at the same time eagerly intent on improvement in his favorite branch of research. He there translated Newton's treatise on fluxions from the Latin, and Hales's "Statics" from the English, into the French language. The 2 manuscripts were presented to the academy of sciences of Paris, and favorably received; the 1st being printed in 1735, and the 2d in 1740, with the approbation of the academy. On March 16, 1749, he was elected member of the academy of sciences, and during the same year appointed director of the *jardin des vég.*, now called the *jardin des plantes*. This appointment called his attention more exclusively to natural history, and diverted his mind from the abstract speculations of philosophy. In lieu of philosophizing on the theory of creation, he resolved to continue the work so brilliantly commenced by Aristotle and by Ely, in describing the organic and the inorganic forms of nature on our globe; and to surpass his predecessors in the adornments of style, and the rich variety of facts, as much as modern art and science surpass those of ancient Greece and Italy. With this view, he collected the cooperation of Dantenton in the anatomical and scientific portions of the work, reserving to himself the more external forms, habits, instincts, and geographical distributions of the animal kingdom. Dantenton and Buffon worked together diligently some 10 years, and in 1749, the first 5 volumes of the "Natural History" appeared; 12 more volumes following at intervals between 1749 and 1767. Few works have ever met with such success; the study of natural science, and particularly natural history, became universally attractive. Buffon's "Theory of the Earth" excited numerous admirers among the more imaginative readers of his works, while those of cooler judgment wondered how a man who had written the preface to the translation of one of Newton's works, could possibly put forth a theory of such a vague and speculative nature. In that preface Buffon wrote the following words: "The system of nature combines, perhaps, several principles; these principles are unknown to us, and their combinations are not less concealed. How is it possible, therefore, for man to enter himself that he can unveil the mysteries of nature, with nothing to guide him but his own imagination!" And yet Buffon had little else than his own imagination, in addition to some scattered facts, to guide him in building up a theory of the foundation of the globe which we inhabit, and the numerous revolutions it has undergone in the course of ages. Buffon made the best attempt he could to form a theory of unity, and failed; but his attempt and failure will help other minds to soar into the higher sphere of thought, and reach more nearly to the final truth. His general views of the animal creation and the natural history of man were more successful than his "Theory of the Earth;" and, notwithstanding

the obscurity of his ideas with regard to "organic molecules," and "interior moulds of form," in his theory of generation, his ideas of relation between form and substance were felt to be at least poetically true, in his own day, and they have since been demonstrated scientifically by the experiments of Flourens on the gradual appearance and disappearance of coloring matter in the bones of living animals. "That which is the most constant and unalterable in nature," says Buffon, "is the type or form of each species; that which is the most variable and corruptible, is the matter or the substance which clothes the form;" and this has been experimentally proved by Flourens, in addition to the evidence of daily nutrition and loss of substance in every individual organism. His eloquent description of the gradual development of the human organism, and the concomitant unfolding of sensation and the faculties of thought and reason, is a masterpiece of observation and delineation never before equalled in its way, nor has it been surpassed. The infant learns by slow degrees to see and feel and hear distinctly, and to separate sensations and ideas, which arrive in a confused mass, into relative degrees of size and shape, distance, force, and motion; and this power of analysis and synthesis increases as the child develops into manhood or womanhood, until the highest powers have been attained of which the individual is capable; some attaining to colossal heights of genius at maturity, while others never grow beyond the stature of a dwarfed intellect; just as the body of one type of animal attains to the proportions of a lion or an elephant, while others, of like nature, never grow beyond the stature and the force of a domestic cat or a small pig. The body is developed slowly, and more slowly still the mind; and Buffon paints in glowing tints the process of unfolding, which suggests to us the difference between the animal and the human powers of discrimination, reason, and progression; the difference between one man's mental development and another's, as the two pass through the animal degrees of infancy, to reach the human, and then stop at very different heights of the ascending scale. The first class of animals described by Buffon were the quadrupeds; the second, birds; and here, with regard to the animal kingdom, his labors ceased. The "History of Domestic Animals," published between 1753 and 1756, was particularly interesting to the farmer and the general reader. That of the carnivorous tribes and other wild species was published between the years 1758 and 1767. More than 3,000 species and varieties are there described. The "History of Birds" was published in 8 volumes, between the years 1770 and 1781. Daubenton then retired from the work, and Buffon obtained the coöperation of Guéneau de Montbeillard, the abbé Bexon, and Sonnini de Manoncourt. The "History of Minerals" was published between 1783 and 1786, and the "Epochs of Nature" in 1788.

The style is always good, and the illustrations rich with imagery, but the theories become more and more hypothetical and vague; but his ideas paved the way for his successors, Cuvier and Geoffroy Saint Hilaire, who have laid the foundations of true science in these branches of investigation. He, more than they, inspires the reader with a love of nature, and transforms the dry details of science into poetry and eloquence of the sublimest kind. His mind was not so keen in the perception of remote relations between normal and abnormal types of organism as that of Geoffroy Saint Hilaire; but he had more poetical views of truth and beauty than either, and deeper intuitions of the unitary laws of nature, physical, instinctual, and rational. His works have been reprinted many times in France, and rendered into all, or nearly all, the languages of Christendom.—He left one son, HENRI LÉCLERC, born in 1764, who erected a monument to his father in the gardens of Montbard, and who died by the guillotine during the revolution.

BUG, Bous, or Bog, a river of Europe. It rises in Galicia, and after a course of 300 miles, during which it receives the waters of the Muchawetz, Zna, and Narew, it joins the Vistula, 18 miles N. W. of Warsaw. It forms the E. boundary of Poland.—Also, the name of a Russian river which empties into the estuary of the Dnieper. It is navigable from the sea to Vosnesensk. Total length, 340 miles.

BUGARES, or BULGARII, a religious sect in Bulgaria, otherwise known as the Catharists, from whom sprung the Paterini of Italy and the Albigenses of Languedoc and Provence. The Bulgarii themselves were a branch of the Gnostic Paulicians of the East after their amalgamation with the Manicheans. They denied the necessity of infant baptism, and rejected the Old Testament.

BUGEAUD DE LA PICONNERIE, THOMAS ROBERT, duc d'Isly, marshal of France, born at Limoges, in Oct. 1784, died in Paris, June 10, 1849. He entered the French army as a private soldier in 1804, became a corporal during the campaign of 1805, served as sub-lieutenant in the campaign of Prussia and Poland (1806-'7), was present in 1811, as major, at the sieges of Lerida, Tortosa, and Tarragona, and was promoted to the rank of lieutenant-colonel after the battle of Ordal, in Catalonia. After the first return of the Bourbons Col. Bugeaud celebrated the white lily in some doggerel rhymes; but these poetical effusions being passed by rather contemptuously, he again embraced, during the Hundred Days, the party of Napoleon, who sent him to the army of the Alps, at the head of the 14th regiment of the line. On the 2d return of the Bourbons he retired to Excideuil, to the estate of his father. At the time of the invasion of Spain by the duke of Angoulême he offered his sword to the Bourbons, but the offer being declined, he turned liberal, and joined the movement which finally led to the revolution

of 1830. He was chosen as a member of the chamber of deputies in 1831, and made a major-general by Louis Philippe. Appointed governor of the city of Blaya in 1835, he had the duchess of Berry under his charge, but earned no honor from the manner in which he discharged his mission, and became afterward known by the name of the "ex-gaoler of Blaya." During the debates of the chamber of deputies on Jan. 15, 1834, M. Larabit complaining of Soult's military dictatorship, and Bugaud interrupting him with the words, "Obedience is the soldier's first duty," another deputy, M. Delong, pungently asked, "What, if ordered to become a gaoler?" This incident led to a duel between Bugaud and Delong, in which the latter was shot. The consequent exasperation of the Parisians was still heightened by his cooperation in suppressing the Paris insurrection of April 13 and 14, 1834. The forces destined to suppress that insurrection were divided into 8 brigades, one of which Bugaud commanded, in the rue Transnonain a handful of enthusiasts who still held a barricade on the morning of the 14th, when the serious part of the affair was over, were cruelly slaughtered by an overwhelming force. Although this spot lay without the circumscription made over to Bugaud's brigade, and he, therefore, had not participated in the massacre, the hatred of the people nailed his name to the deed, and despite all declarations to the contrary, persisted in stigmatizing him as the "man of the rue Transnonain." Sent, June 16, 1836, to Algeria, Gen. Bugaud became invested with a commanding position in the province of Oran, almost independent of the governor-general. Ordered to fight Abd el Kader, and to subdue him by the display of an imposing army, he concluded the treaty of the Tafna, allowing the opportunity for military operations to slip away, and placing his army in a critical state before it had begun to act. Bugaud fought several battles previous to this treaty. A secret article, not related to writing stipulated that 30,000 boojous (about \$12,000) should be paid to Gen. Bugaud. Called back to France, he was promoted to the rank of lieutenant-general and appointed grand officer of the legion of honor. When the secret clause of the treaty of the Tafna came out, Louis Philippe authorized Bugaud to expend the money on certain public roads, thus to increase his popularity among his electors and secure his seat in the chamber of deputies. At the commencement of 1841 he was named governor-general of Algeria, and with his administration the policy of France in Algeria underwent a complete change. He was the first governor-general who had an army adequate to its task placed under his command, who exerted an absolute authority over the generals second in command, and who kept his post long enough to set up to a plan needing years for its execution. The battle of Idj (Aug. 14, 1844), in which he vanquished the army of the emperor of Morocco with vastly inferior forces, proved its success to

his taking the Mussulmans by surprise, without any previous declaration of war, and when negotiations were on the eve of being concluded. Already raised to the dignity of a marshal of France, July 17, 1843, Bugaud was now created duke of Idj. Abd el Kader having, after his return to France, again collected an army, he was sent back to Algeria, where he promptly crushed the Arabian revolt. In consequence of differences between him and Guizot, occasioned by his expedition into Kabylia, which he had undertaken against ministerial orders, he was replaced by the duke of Aumale, and, according to Guizot's expression, "enabled to come and enjoy his glory in France." During the night of Feb. 22-23, 1848, he was, on the secret advice of Guizot, ordered into the presence of Louis Philippe, who conferred upon him the supreme command of the whole armed force—the line as well as the national guard. At noon of the 23d, followed by Gen. Balthazar Bedon, Lamoriciere, De Saligny, St. Arnaud, and others, he proceeded to the general staff at the Tuileries, there to be solemnly invested with the supreme command by the duke of Nemours. He reminded the officers present that he who was about to lead them against the Paris revolutionists "had never been beaten, neither on the battle-field nor in insurrections," and for this time again promised to make short work of the "rebel rabble." Meantime, the news of his nomination contributed much to give matters a decisive turn. The national guard, still more incensed by his appointment as supreme commander, broke out in the cry of "Down with Bugaud!" "Down with the man of the rue Transnonain!" and positively declared that they would not obey his orders. Frightened by this demonstration, Louis Philippe withdrew his orders, and spent the 23d in vain negotiations. On Feb. 24, alone of Louis Philippe's council, Bugaud still urged war to the knife; but the king already considered the sacrifice of the marshal as a means to make his own peace with the national guard. The command was consequently placed in other hands, and Bugaud dismissed. Two days later he placed, but in vain, his sword at the command of the provisional government. When Louis Napoleon became president he conferred the command-in-chief of the army of the Alps upon Bugaud, who was also elected by the department of Charente-Inférieure as representative in the national assembly. He published several literary productions, which treat chiefly of Algeria. In Aug. 1852, a monument was erected to him in Algiers, and also one in his native town.

BUGENHAGEN, JOHANN, surnamed POME-RANUS, or Dr. POMMER, a German Protestant theologian, a contemporary and friend of Luther, born at Wollin, near Stettin, June 24, 1485, died April 20, 1559. He was fully persuaded by the publication of Luther's treatise on the Babylonish captivity. He thus announces his espousal of the Protestant cause: "The whole world is blind, walking in Climmerian

darkness; this man alone sees the truth." He assisted Luther in the translation of the Bible, and published a great number of books now little read or known.

BUGGE, THOMAS, a Danish astronomer, born in Copenhagen, Oct. 12, 1740, died June 15, 1815. After Tycho de Brahe, he was the greatest astronomer of Denmark. First officiating as professor, he afterward spent most of his time in travelling abroad, and was sent to Paris in 1798 to confer with the commission of the French institute on the subject of the introduction of uniform weights and measures, on which occasion he was made a member of that learned body.

BUGIS, a people of the Malay archipelago, noted for a spirit of enterprise and independence. Their colonies and emporia of trade are found in many islands, in all parts of the archipelago; but the chief seat of this people is in the southwestern peninsula of Celebes, in the territories of Boni and Wajoo. The Bugis traders are the chief carriers and factors of the Indian seas. In the European ports of Singapore, Malacca, Batavia, and Rhio, their richly freighted vessels are to be seen at all times. From data derived from their intercourse with these ports, they had in 1857 about 950 *padenakans*, or prahus, averaging 50 tons each, engaged in foreign trade; and probably a still larger amount of tonnage engaged in the tripang, pearl, and other fisheries, and in trade with the Papuan islands, and other portions of the archipelago not yet in direct communication with European commerce. The value of this native trade may be judged from the fact, that it is not uncommon to see in the port of Singapore the cargo of a *pade-wakan*, consisting of dammar, sapan wood, birds' nests, tripang, pearls and mother of pearl, ratans, gatah taban, nutmegs, and other Malaysian products, sell for \$20,000 and \$30,000, and even for as large an amount as \$50,000. Their advancement in civilization keeps pace with their active commercial development. Barbosa, in 1515, describes the Bugis and their neighbors, the Macassars, as ferocious pirates and cannibals. None of the Portuguese historians of the archipelago give any intimation of the commercial enterprises of this race. When in 1660 the Dutch conquered the Macassar tribes of Goe, no other mention is made of the neighboring Bugis people than as of an inferior race of barbarians. A little while previous to this conquest, the Macassars had invaded the Bugis territory, destroyed the pagan worship of the people, and forced them to receive teachers of the Mohammedan faith, the Bugis being the last converts to the creed of the Koran in the archipelago. Islamism abolished head-hunting, as now practised by the Dyaks in Borneo, human sacrifices, cannibalism, and many degrading superstitions; and from this period of conversion to the present day, this people have made rapid progress toward a respectable position in the civilized world. They are perhaps a more vigorous and promi-

ing branch of the brown races than the New Zealanders. They have domesticated the horse, ox, buffalo, sheep, and goat. They cultivate cotton successfully, and manufacture it into cloths of substantial quality; they are skilful workers in iron and copper; the wealthy construct houses of substantial materials, the walls of some being made of a solid mass of small broken stone and cement, which after a short time cannot be torn apart with chisel or pick, and their dwellings are generally surrounded with evidences of much horticultural taste; they build durable sailing vessels; in their navigation they use charts and compasses; they have framed a maritime code, that has been admired by authorities in naval jurisprudence; they have also framed a calendar, dividing the solar year as we do; but more than all, they have invented an alphabet and a system of phonetic writing, which none of the energetic races of western Europe, except those of Italy, have done. The government of this people is an oligarchy or elective monarchy. The state of Boni is composed of 7 principalities; and that of Wajoo, of 40. In both states the sovereign is elected by the nobles, and from the patrician class. The vote, in choosing a ruler, must be unanimous; and often the merits of every nobleman and noblewoman (females being eligible, and generally preferred), in the state, is canvassed, before a choice is made; the sovereign only holds power during good behavior, and may be deposed by an adverse majority vote in council; hence there are frequent changes in the presidency, as the executive power of the Bugis people may be justly termed. A privy council of 5 nobles is chosen to advise with the chiefs, who receive the title of *Bati-lumpo*, or "great banners." The people pay no taxes; except a small tribute of three days' labor, or an equivalent, to the sovereign; and there are no imposts on trade. Strangers visiting their ports are exempt from all charges. The princes derive their revenue from their own estates. An unrestricted freedom of intercourse with all parts of their own country, and with foreign countries, prevails; and this liberty of foreign enterprise, joined to their entire freedom of trade, may be justly regarded, as it has been observed, as both the cause and effect of the independence, enterprise, and prosperity of this interesting people. The Tuwaju, or Waju tribes, are esteemed as decidedly superior in many respects to their brethren of Boni. The Wajus have been enterprising colonists as well as traders. Large communities of this tribe have within the present century been formed in Borneo, Sumatra, in portions of Celebes distant from the parent country, and in many small islands of the archipelago. The native entrepot of Bonirati is one of their settlements. In Singapore they form a separate and flourishing community. They have not been encouraged by the Dutch to establish settlements in their possessions; and indeed the rulers of Java have so often been worsted in hostile encounters with

the brave Bugis, that they may justly dread the sentiment of such a vigorous and free-spirited race among the feeble people they control. It is worthy of special notice that among this people, the most enterprising of the eastern hemisphere, not even excepting the Chinese, and who promise, judging from their past rapid progress, to become the leading race in the archipelago, and to be probably the founders of an enlightened Oceanic empire, their women possess the fullest social and political equality. The greater portion of the sovereigns of Luwaja and Bond, since these states have been known to Europeans, have been females. The Bugis women manufacture all the cloth, and other staples of Bugis trade; they carry on all the shipbuilding at home; and in many instances are mechanics on board of Bugis yachts; and not infrequently their navigators. A romantic event of recent occurrence, which was generally noticed by the journals of Europe and of this country, is a signal illustration of the energetic character of the Bugis women. Col. Poland of the Netherland India army, when a lieutenant in command of a detachment of European and native troops in Celebes, was attacked by a large body of Macassar insurgents. Early in the action he was wounded; and his troops being forced to retreat before overwhelming numbers, he was left on the field and was on the point of being despatched by the kreos of the Macassars; but at this juncture a Bugis girl, daughter of a native soldier to whom the commander had shown kindness, with *klewang* in hand felled the foremost Macassar, and so vigorously defended the prostrate lieutenant as to induce the others who threatened his life to follow their victorious competitors. The hero's *Fiema*, the name of the girl, dragged the wounded man to a cool shade, nursed him in the woods for 2 weeks, and afterward led him to a place of safety. When Poland was made colonel, and retired on a pension, he married *Fiema*, in Holland, in 1856.

DUBLE-HORN, a musical wind-instrument, of brass or other metal, which, by the addition of keys, is capable of producing all the inflections of the scale. It was formerly peculiar to the chase, and was called by the Germans the *Waldhorn*, or wood-horn, but is now almost indispensable in military or orchestral bands.

DUBLE, JOHANN GOTTLIEB, a German philosopher, born at Brunswick, in 1763, died in 1821. When only 18 years old he delivered a course of lectures on the history and literature of philosophy; and at the age of 30 he gained at Göttingen the academic prize. In 1787 he was appointed professor extraordinary, and in 1793 professor of philosophy at Göttingen. When the French revolution broke out he was deprived of his professorship, and withdrew to Bussia, where he became successively professor of philosophy, history, and literature in the university of Moscow, librarian of the grand duchess Catherine, and councillor of state. He retired from Moscow before its occupation by

Napoleon, and drew up a comparison between the taking of Moscow by the French, and of Rome by the Goths. He returned in 1814 to his native town. His summaries of the history of philosophy, and his manual of "Natural Right," are among the most important of his works.

BUHL-WORK, a process of inlaying by the use of the saw, the name of which is supposed to be derived from a famous Italian workman named Buhl, who settled in France in the reign of Louis XIV., and carried on this business, which he invented. As practised by him the work consisted in inlaying dark-colored tortoise shell or wood with brass, and in flowing patterns to imitate vines and wreaths of flowers. Kelsner, who practised the art at a little later period, made use of woods, which contrasted well in color; and the term is now applied to his process. The general term, *marqueterie*, designates in France all the varieties of this kind of work. It consists in cutting out a pattern from two veneers of different-colored woods, which are glued together with a piece of paper laid between them; and then, after separating the pieces by running a thin knife-blade through the paper, the patterns are carefully taken out, and the figure removed from the one is inserted into the cavity of the other, the dust of the wood being rubbed in to fill the interstices. The cutting of the pattern is effected by the use of a very fine saw, of the kind known as a key-saw, which can readily be made to run around the sinuities of the pattern. The suitable designs for this work are continuous figures, like a running vine or the honeysuckle, the saw completing these without the necessity of discontinuing the work to commence anew. When three thicknesses of wood are glued together and cut, the work is carried on more rapidly, and with more variety; but it is not found expedient to increase the number of thicknesses beyond this. In old work of this kind it has been found that different woods contract unequally, and at last produce a defective joint. This is remedied by the use of veneers of the same light-colored wood, one of which is dyed a dark color. In inlaying pearl work by the Buhl method, some modifications of the process are rendered necessary by the small size of the pieces, and by greater care required to make a nice joint. The saw in this is run through at an angle to give a bevelled edge, and the lines are filled in with strings of white metal, as tin or pewter.

BUURSTONE, called by the French *silex caulaire* and *pietre meulière*, the best material known for constructing millstones. It is a silicious rock found interstratified with the sands, marls, and sandstones of the tertiary formations of the Paris basin, peculiar for its regular cellular structure and hardness like flint, with which it is identical in composition, both being mere varieties of quartz. It is these qualities of extreme roughness, derived from its honey-combed structure, and great hardness and strength, that render it the best stone for

grinding. The fossil shells of land and fresh water origin, with which the rock is sometimes filled, are converted into the same hard silicious substance as the rest of the stone, and their cavities are often lined with crystals of quartz. The color of the rock is whitish, with a shade sometimes of gray, and sometimes of yellow and blue. The best quality is that about equally made up of solid silex and of vacant spaces. The stones are quarried at numerous localities near Paris, whence they are transported in large quantities into the interior, and to Bordeaux and Havre for exportation. La Ferté-sous-Jouarre, Seine-et-Marne, is one of the most important points where they are procured. The quarries are worked open to the day, and the stones, when extracted from their beds, are split with wedges into cylindrical forms. The pieces are cut into parallelepipeds, which are called *panes*. These are to be hooped together into the shape of millstones, answering the purpose perfectly well, while they are of much more convenient size for transportation than single stones. Good millstones of a bluish white color, and 6½ feet diameter, are worth 1,200 francs, or about \$250, each. In this country numerous substitutes for the French buhrstone have been found, the most important of which is furnished by the Buhrstone rock of the bituminous coal measures of north-western Pennsylvania and eastern Ohio, immediately underlying the principal iron ore deposits of that region. This rock has been wrought into millstones ever since the revolution, but the French rock has, nevertheless, maintained a decided preference in all the great markets.

BUIL, BERNARDO, the first Spanish missionary in the new world, died in the convent of Cuxa, in 1520. He was selected by Ferdinand and Isabella to accompany Columbus for the purpose of converting the natives of Hispaniola. He took with him several priests, but returned to Spain after 2 years in consequence of disagreements with the governor concerning the treatment of the natives.

BUILDING, the art of construction, applicable to a variety of objects, as houses, bridges, wharves, ships, &c. The term architecture, of which building is the mechanical execution, is in common use limited to the construction of buildings for the purposes of civil life; but this is sometimes designated as civil architecture, in contradistinction to the planning and construction of forts, &c., which is called military architecture, or of ships, which is called naval architecture. Building also is commonly understood to apply to only the first class of objects, unless otherwise specifically designated. Even thus limited, it is too comprehensive for more than a general notice; so that for the details of the art reference must be made to the articles in this work upon the materials employed, as **BRICK, STONE, TIMBER, BEAMS, SLATE, LIME, &c.**; and also to those upon the various minor portions or processes of the construction, as **FOUNDATIONS, CARPENTRY, PAINTING, WARM-**

ING, VENTILATION, &c., &c. With all these subjects the practical builder should be familiar, as also should the architect, who designs the plans which the former executes. The history and principles of building have already been treated in the article **ARCHITECTURE**. The importance of this art to all classes of men has caused it to receive especial attention with all cultivated nations; and from early periods there have been able treatises elucidating the various processes it includes. The modern progress it has made has called forth numerous works and periodicals devoted to this subject, among which may be named as particularly adapted to the wants and tastes of this country, Lafever's "Modern Builder's Guide" (New York, 1846), and Sloan's "Model Architect." Among English works, those of Loudon, and the periodical called the "Builder," may particularly be referred to. A very elaborate work by Rondelet was published in Paris in 1830-'32, in 5 vols. quarto, with a folio volume of plates, entitled *Traité de l'art de bâtir*.

BUITENZORG, the official name of the ancient province of Bogor, in the island of Java, now forming a residency; bounded N. by the residency of Batavia, E. by Krawang, S. by the Prayangan regency, and W. by Bantam. Area, 1,276 sq. m.; pop. 820,756, of whom 650 are Europeans, 9,580 Chinese, and 28 Arabs. The name was first given to a country seat of the Dutch governor-general, and signifies "without care," or equivalent to *sans souci*. This rural residence of the Dutch viceroy is now a place of considerable magnificence; being situated nearly 1,000 feet above the level of the sea, it enjoys a much more invigorating climate than Batavia, which is 40 miles distant. Many fruits of temperate climates, the cherry and plum, and every variety of European esculent vegetables, are cultivated with success in the gardens of Buitenzorg. A park enclosing several tigers and other wild beasts, large tanks filled with the fresh-water fish of the archipelago, and aviaries containing cassowaries, rhinoceros birds, and other remarkable birds of these islands, form a part of the oriental features of this palatial residence. The grandeur of the surrounding mountain scenery is very imposing. A company was formed, partly American capitalists, to construct a railroad from Batavia to Buitenzorg, but the government withdrew permission to go on with the work, even after the locomotives and other material had been imported. However, an electric telegraph is established between the capital and the seat of the viceroy; but it is used exclusively for government purposes.

BUKKEN, an island on the W. coast of Norway, province of Christiansand. It has a small village of the same name. The Bukke or Bukken fiord, an arm of the sea 35 miles long, from 10 to 15 miles wide, and crowded with small islands, separates it from the island of Karmoe.

BUKKUR, a fortress of Sinde, Hindostan, occupying nearly the whole of a rocky island

of the same name, in the India, opposite the town of Rangoon on the E. and Sakku on the W. bank of the river. Before the annexation of Sindh, it belonged to the ameer of Kyrgyz, by whose permission it was garrisoned by the British in 1839, during the Afghan war. About that time the Bengal army on its march to Afghanistan crossed the river here on a bridge of boats, which was soon after swept away.—Also, a town in the Panjab, near the Indus, with an extensive commerce. Pop. about 5,000.

BULAGAN, a town of Luzon, and capital of a province of the same name, in the Philippine islands, 30 miles N. W. of Manila. It is situated on the river Bulagan, which is here crossed by a bridge of 6 arches. Sugar, silks, and carpets are its chief manufactures. Pop. 9,833.

BULAMA, the easternmost of the Bessagos islands, off the W. coast of Africa, 30 miles S. of Bissau. Lat. 11° 04' N., long. 16° 03' W. It is about 13 miles long by 9 miles wide, densely wooded, fertile, but unhealthy. The land rises from the coast toward the centre, where the elevation is about 100 feet above the sea. In 1793 an English company, called the Bulama association, sent out here a colony of 276 miserable adventurers, most of whom were soon carried off by disease. The remnant sailed for Sierra Leone the following year. Portugal now claims the island, but in a recent parliamentary report on western Africa, its reoccupation by the British for commercial purposes and the suppression of the slave trade was earnestly recommended.

BULARCHUS, the earliest painter mentioned in history. He was of a Greek colony in Asia Minor, and lived more than 700 years B. C.

BULB, in botany, a broad imbricated bud, usually subterranean, emitting roots beneath, and developing the herbaceous stock and foliage upward. The leaves or scales with which it is clothed are thickened by the deposition of nutritive matter, stored for the future use of the plant. It differs from the tuber, which is the enlargement of a subterranean branch.

BULGARIA, a dependency of European Turkey. The Danube forms the whole of its northern, and the parallel chain of the Balkan its southern, boundary. It has an area of about 33,000 sq. m., and is divided into 3 eyalats, or provinces, viz.:

	Pop.	Christians.
Silistria.....	1,870,000	155,028
Widdin.....	1,000,000	508,522
Sissa.....	1,354,000	573,022

Total..... 4,224,000 with 1,236,572 Christians.

and the rest Mussulmans, Jews, Serbians, Gypsies, Greeks, Armenians, Tartars, and Russian settlers, Boezyaks and Wallachians, Germans, Italians, and Hungarians. Sophia (Bulgarian, *Trilohitsa*), in the eyalat of Widdin, Sistova, and Nicopol are among the chief cities. The most strongly fortified towns are Varna, Silistria, Shoomla, and Roustchouk. The principal rivers are the Danube, with its tributaries, the Isker, Vid, Yantra,

and Oema, and the Kamtsiak and Ptervel, which enter the Black sea. The river Mariza rises southward from the Balkan. The largest lake is that of Bessin, which is separated by a narrow strip of land from the St. George's mouth of the Danube, from which a little arm, called Danawitz, enters the lake, the communication of the lake with the Black sea being formed by 2 channels, called the Jabova and the Porticha mouths. The surface is mountainous in the south, level in the north, generally well wooded, and with dense forests along the Balkan range. Iron, lead, and some silver are found. Agriculture is more flourishing here than in any other part of Turkey. The largest quantities of grain are grown in Silistria, and in the plains near the Danube. The general exports of the country comprise, beside various kinds of grain, timber and oak planks, hemp, flax, tobacco, hides, honey, wax, and great quantities of tallow, 40,000 oxen or more being fattened during the summer months and slaughtered during the autumn for their hides and fat, beef being seldom eaten by the Mussulman, whose favorite food consists of mutton and goat's flesh. Large quantities of wine are made, and fruits are abundant. Roses abound, and gardens are laid out to cultivate them, Bulgarians excelling in the preparation of otto or attar of roses, much of which goes to England. The Tartar population is actively engaged in the rearing of horses (of an inferior breed), and in the culture of bees. Beside horses, horned cattle, and buffaloes, the country produces sheep and goats, also swine for the consumption of the Christian part of the population. Grain is occasionally shipped in lighters to Matelin, a small port opposite Brailoff, and thence exported to foreign ports, but the chief Bulgarian shipping port is Varna, in the eyalat of Silistria, which has an annual aggregate tonnage, inward and outward, of about 45,000 tons, in about 500 vessels. There is also a depot at Varna for tallow and other products. The most noted manufactures of the country are coarse woollen cloth, and rifle barrels. The rest are all of coarse goods. The imports are manufactured goods, coffee, spices, sugar, salt, &c. The town of Sistova carries on an extensive trade with Wallachia, and has a large commerce in manufactured goods imported from Austria. The agricultural production is estimated at \$17,000,000, the industrial at \$4,000,000.—Bulgaria was the *Mosia Inferior* of the Romans, and derives its name from northern hordes who invaded the country in the 7th century. The history of the Bulgarians presents a series of continued conflicts with the Servians, Greeks, and Hungarians on the one hand, and on the other with the Turks, who finally subdued them, and put an end to the existence of a Bulgarian kingdom in 1392. The territory is of the first importance to the integrity of the Turkish empire, and to neutralize the Russian influence which operates powerfully

in Bulgaria, is a matter of great moment for the Turkish government. In 1853, during the Russian occupation of Moldavia and Wallachia, the line of fortresses along the left bank of the Danube and those in the Balkan range were guarded by a large Turkish army, divisions of which crossed the Danube opposite Oltanitz and Kalafat, and obtained some slight advantages over the Russians. The St. George's mouth of the Danube is by treaty open to all trading vessels, and to the war ships of Russia and Austria, and measures have lately been taken to facilitate the navigation, which is difficult. Various railways are projected; but that between Boghazkew and Kustendji, is the only line to which a charter has as yet been granted, and which, when completed, will be the first railway in operation in Turkey.

BULGARIAN LANGUAGE AND LITERATURE. Bulgaria and the adjacent provinces of Macedonia are considered to have been the cradle of the old Slavic languages. The ancient Bulgarian language was the richest of them all, and was the Scriptural language of the Greek-Slavic church, and the great medium of ecclesiastical literature in the ancient Slavic lands. After the overthrow of the Bulgarian kingdom at the close of the 14th century, the grammatical structure and purity of the language became impaired by mixture with the Wallachian, Albanian, Roumanian, Turco-Tartar, and perhaps Greek vernaculars; and the modern Bulgarian language has only the nominative and vocative of the 7 Slavic cases, all the rest being supplied by prepositions. It has an article, which is put after the word it qualifies, like that of the Albanians and Wallachians. Among the ancient Bulgarian ecclesiastical literature must be mentioned the translations of the Bible by Cyril and Methodius, and the writings of John of Bulgary in the 10th century. The modern literature is very slender, consisting almost entirely of a few elementary and religious books. Grammars of the Bulgarian language have been published by Neofyt in 1835, and by Christiaki in the following year. Venelin, a young Russian scholar, sent to Bulgaria by the Russian archæographical commission, published in 1837 a grammar and 2 volumes of a history of the Bulgarians, but died while he was engaged in preparing a 3d volume. A new grammar was given to the public by Bogojev in 1845, and finally in 1849, by the Rev. E. Riggs, an American missionary stationed at Smyrna, who also sent a Bulgarian translation of Gallaudet's "Child's Book on the Soul" to New York. Dictionaries of the Bulgarian language have been prepared, or are in course of preparation, by Neofyt and Stojanowicz. A Bulgarian version of the New Testament was printed at Smyrna in 1840, for the British and foreign Bible society. The Bulgarian national songs are numerous, and are similar to those of the Servians. Czelakowsky's collection of Slavic songs contains a number of Bulgarian songs. Bogojev published 12 historical poems in 1845,

while a publication on the subject of education has appeared from the pen of Neofyt. Bulgarian publications are issued chiefly in Bucharest, Belgrade, Buda, Cracow, Constantinople, Smyrna, and Odessa. A paper, called the "Bulgarian Morning Star," has appeared at the latter city since 1843. The first number of a monthly magazine, entitled "Philology," was issued from the press of Smyrna in 1844, and a Bulgarian almanac from the same press in 1856.

BULGARIN, THADDEUS (Polish *TADDEUSZ BULHARYN*), a Russian author, born in 1789, in Lithuania. His father fought under Kosciuszko, and after the fatal issue of the Polish war of independence, his mother removed to St. Petersburg, where Thaddeus was educated at the military academy. In 1805 he took a part in the war against France and Sweden, and subsequently left the Russian service, served in the Polish legion in Spain, was taken prisoner by the Prussians in 1814, served on recovering his liberty under Napoleon, and after the Emperor's downfall, occupied himself with literary pursuits in Warsaw. After some time he returned to St. Petersburg, and, throwing off his Polish nationality, he henceforth devoted himself to Russian literature. In 1823 he edited the "Northern Archives," originally a historical and statistical paper, but which he made popular in Russia by his humorous and satirical contributions. In 1825 he published in conjunction with his friend Gretsach the "Northern Bee," became also editor of the "Daguerreotype," and of the first Russian theatrical almanac, called the "Russian Thalia." His complete works, published at St. Petersburg, 1827, and at Leipsic, in German, in 1828, include many of his fugitive essays and his Spanish sketches, to which he added his Turkish sketches in a separate volume. In 1829 he made his debut as novelist with "Ivan Vuishigin," or the Russian "Gil Blas," of which "Peter Ivanovitch Vuishigin" is the continuation. Subsequently he published 3 works containing pictures of Russian life, "Rostavlev," "Demetrius" and "Mazepa," which have lost somewhat of their popularity in Russia, although from a Russian literary point of view they have many excellent points, especially the two last-named novels, from their historical character, and generally from the insight which they afford into Russian life. His Russian "Gil Blas" was published in English at Aberdeen in 1831, and his "Russia in a Historical, Statistical, Geographical, and Literary Point of View," one of his most valuable works, has been translated into German by Brackel. His literary labors proved profitable, and he lives in comfortable circumstances in a villa near Dorpat. His last work, *Vospominaniya*, of which 6 volumes have already appeared, contains interesting reminiscences of his stirring life. The czar and his family have always befriended him, and he writes with a strong bias in favor of Russia.

BULKHEADS, the partitions built up in

several parts of a ship, to firm and separate the various apartments.

BULKLEY, PARRIS, first minister of Concord, Mass., born at Woodhill, Bedfordshire, in 1682. He was educated at Cambridge, and succeeded to the living of his father in Woodhill, which he retained for 21 years. He was removed from this by Archbishop Laud, for non-conformity to certain ceremonies of the church, whereupon he immediately left England for the new world. He settled with a few companions in a place first named by them Concord, in the colony of Massachusetts, since distinguished in New England history, where he died in 1690. He was the author of some Latin poems, which are contained in Cotton Mather's "History of New England," and also of the "Covenant Opened," published in London in 1686. He was as remarkable for his benevolence and kind dealings as for the strictness of his virtues.

BULL, PAPA (Lat. *bulle*, a seal), one of the forms in which the pope issues his ordinances. It differs from a brief in that the latter is shorter and less solemn, though equally authoritative. Briefs are sealed with red wax, stamped with the fisherman's ring. The seal of a bull is of lead or gold, stamped on one side with the effigies of Saints Peter and Paul, and on the other with the name of the reigning pope, and attached to the document by strings. The two sets differ also by the subscription, salutation, and apostolical benediction, which are simpler in the brief; and by the date, which is taken from the modern calendar for briefs, and from the Roman calendar for bulls. Bulls are commonly designated from the words with which they commence, as the bull *In cæna Domini*, which was formerly read publicly at Rome on Holy Thursday, and contains a general excommunication against heretics and those contumacious and disobedient to the holy see. Its publication was suspended by Clement XIV. in 1773. Among the bulls most celebrated in history are the *Unigenitus*, given in 1296, by Boniface VIII., and which began his contest with Philip the Fair; the *Execrabilis*, issued by Pius II. in 1450, to interdict appeals to future councils; the *Exsurge Domine*, directed in 1520 by Leo X. against Luther, who burned it at Wittenberg; the *Decretum*, by which Innocent X. condemned the 5 propositions of Jansenius, in 1653; the *Unigenitus*, issued by Clement XI. in 1713, against the "Moral Reflections" of Quesnel; the *Pastorale*, by which Pius VII. in 1800 established a new judiciary order in the state of the church; and the *Ineffabilis Deus*, by which Pius IX. in 1854 established the dogma of the immaculate conception.—**BULL**, DUNN, or **HALF BULLS**, are instruments of this character issued by the pope before his coronation, and so called from the fact that the lead or gold is stamped only on one side.

BULL, GEORGE, an English prelate, born at Walls, Somersetshire, March 25, 1664, died Feb. 17, 1710. Having graduated with distinc-

tion at Oxford, he was ordained at the early age of 21, and soon became rector of St. George's, near Bristol. Here he made himself beloved by all, and kept his parish in peace during those troublesome times. On one occasion, while he was preaching, a certain fanatic rushed out, "George, come down! thou art a hireling and a false prophet!" George did come down, but only to receive this scolding from the fury of the congregation, who wished to resent on the spot the insult offered to their pastor. In 1689 he became rector of Sodbington St. Mary, in Gloucester, and in 1692, of Saldington St. Peter. In 1698 he published in the Latin tongue his most important work, called *Harmonia Apostolica*. This is an attempt to reconcile the apparent contradictions between St. James and St. Paul, on the doctrine of justification. This publication exceeded his fame to foreign countries, and his reputation procured him a stall in the cathedral of Gloucester. In 1705 he was promoted to the bishopric of St. David's. He is reckoned among the great lights of the church of England.

BULL, JAMES, the popular name applied to Englishmen. It was first used by Dean Swift; others ascribe its origin to Dr. Arbuthnot's novel entitled "John Bull."

BULL, JAMES, an English musician, born in Somersetshire about 1563, died at Lübeck, in Germany, about 1622. In 1596, on the recommendation of the queen, he was appointed professor of music at Grodham college, which position he resigned in 1607 to become chamber musician to King James. He quitted England in 1618, and finally settled in Lübeck. As a performer on the organ, he was the most able musician of his age. Having once performed before King James a song which he called "God save the King," the present national anthem of England has been erroneously attributed to him.

BULL, OLE BORNEMANN, a Norwegian violinist, born at Bergen, Feb. 3, 1610. His father, a chemist, who had destined him for the church, steadily repressed his son's passion for music. At the age of 18 he was placed at the university of Christiania. His skill on the violin gained him no favor with the professors; and when he took the temporary charge of the orchestra at one of the theatres, during the illness of the leader, his connection with the university was dissolved forever. In 1829 he went to Cassel to study with Spahr, but his reception was so chilling, that in a moment of despondency he went to Göttingen and commenced the study of the law. His fondness for his art, however, soon interrupted this pursuit, and he went to Minden, where he gave a concert with considerable success. While at this place he had a quarrel with a fellow-artist, which resulted in a challenge. The parties met, and Ole Bull's antagonist was mortally wounded. Compelled to leave the country, he betook himself to Paris, where he arrived poor and unknown, and for some time

led a precarious and most wretched existence. Moreover, he was robbed of every thing he possessed, including his violin, and in despair he threw himself into the Seine, from which he was rescued. A bereaved mother, who traced in his features a remarkable resemblance to her dead son, took him into her house, and assisted him so liberally that he was enabled to make his first appearance in public as a violinist. The public were charmed by the performance, and the proceeds of his first concert enabled him to make a musical tour through Italy. The next 7 years were spent in frequent professional tours through Italy, France, Germany, England, and Russia, by which he acquired a handsome fortune. Returning to his native place in 1838 with his wife, a Parisian woman, he settled upon an estate which he had purchased in the neighborhood. At the end of 5 years he came to the United States, and experienced an enthusiastic reception; and after a career of great pecuniary success, he returned to Europe in 1845. During the next 7 years, he gave concerts in the chief cities of the continent, made a campaign in Algeria against the Kabyles with Gen. Yusuf, made improvements in musical instruments, built a theatre in Bergen, and endeavored to establish in Norway national schools of literature and art. Influenced by patriotic feelings, he introduced political sentiments into the dramas performed at his theatre, and was brought into collision with the police. Vexatious lawsuits, resulting from these troubles, dissipated a large portion of his fortune; his wife sank under the rigors of the climate; and the artist once more left his country for the new world, where he arrived in 1852. In that year he purchased a large tract of uncultivated land, comprising 120,000 acres, situated in Potter co. in the northern part of Pennsylvania. A large number of families, to whom the lands were sold at a nominal price, gathered upon the spot, forming the germ of an extensive agricultural colony, to which the name Oleana was given, in honor of the founder. For a time the new settlement was favored by bright prospects; but dissensions soon crept in; pecuniary embarrassments followed; and at length the project was entirely abandoned and the colony broken up. To repair his shattered fortunes, Ole Bull resumed his concerts, and after the completion of the academy of music in New York, in 1854, took a lease of the building with the intention of undertaking the management of the Italian opera. The enterprise proved disastrous, and at the end of 2 months he found himself involved in a number of lawsuits resulting from it, beside having experienced heavy pecuniary losses. He has since returned to Europe, and is now (1858) engaged in giving concerts in Vienna and other cities.

BULL, WILLIAM, an American physician, and lieutenant-governor of the colony of South Carolina, of which province he was a native, born in 1710, died in London in 1791. He received at Leyden a medical degree, the first, or

one of the first, ever obtained by a native of America. With some short intervals he was lieutenant-governor of South Carolina from 1764 till that province ceased to be subject to Great Britain. He was faithful to the crown in 1776, and in 1782 accompanied the British troops to England, where he resided during the remainder of his life.

BULL-BAITING, a barbarous and brutal exhibition, common in England from a very early period till the commencement of the reign of George IV., when it was prohibited by act of parliament. The bull was secured to a post by a chain fastened through a ring in his nose, allowing him to move in a circle, but preventing him from gaining his liberty, which would have been dangerous to spectators, when bull-dogs were let loose to run at him, which, rushing always at the head, either pinned the bull by the nose or lip, or were tossed in the air, gored and trampled. The excitement consisted in witnessing the courage of the dogs in the attack and of the bull in defence; but there was no fairness in the contest, as the more powerful animal, chained to the stake, had neither the opportunity to decline the contest, nor to exert his powers, and terminate it by defeating his enemies.

BULL-DOG (*canis molossus*), a species of dog, said to be peculiar to the British islands, and distinguished almost solely for its indiscriminating ferocity. The dog, generally, by naturalists, is distinguished into 8 divisions, to one of which all natural species belong, while to a combination of 2 or more all the artificial varieties are to be referred. These are the *canes sagaces*, *veloces*, and *feroces*, distinguished respectively for their intelligence, their speed, and their ferocity. The first or highest is represented by the spaniel, to which belong all the pure species which hunt by scent; the middle, by the greyhound, or, more properly, *gashound*, to which are referred all those which hunt mainly or solely by speed; and the lowest, by the bull-dog, of which pugnacity is the sole characteristic. The bull-dog is low in stature, deep-chested, and strongly made about the shoulders, which, with the chest and neck, are enormously developed, as are also the muscles of the thighs behind, although, generally, the hind quarters are light as compared to the fore part, and the flanks hollow and tucked up, like those of the greyhound. In his head, however, are seated his principal peculiarities. It is remarkable for its short broad muzzle, and the projection of its lower jaw, which causes the lower front teeth to protrude beyond those of the upper. The *condyles* of the jaw are placed above the line of the upper grinding teeth; and it is this conformation which renders the bite of the bull-dog so terribly severe, and his hold, when once taken, almost immovable. The lips are thick, deep, and pendulous; the ears fine, small, and pendant at the tip; the tail thick at the root, but tapering to a point, as fine as that of the greyhound. "He is the most ferocious and un-

relenting of the canine tribe, and may be considered courageous beyond every other creature in the world; for he will attack any animal, whatever be his magnitude, without hesitation, either at his own caprice, or at the bidding of his owner. His most important quality, and that, probably, which causes all the others, although we cannot perceive the connection, is the diminution of the brain; which, in the bull-dog, is smaller and less developed than to any other of the race; and it is, doubtless, to the decrease of the encephalon that must be attributed his want of intelligence, and incapacity for receiving education." So strongly marked is this peculiarity, that an able recent writer on the dog mistakes the bull-dog as a sort of abnormal canine monster, a dog idiot, yielding to uncontrollable physical impulses, now of blind ferocity, now of equally blind and indiscriminating, wantonly tenderness, which renders him more addicted to licking, slobbering, and muzzling the hand, the foot, or any other part of any person to whom he takes a sudden and capricious liking, and whom he is just as likely to assault the next moment, than any other of his species. This view is, however, scarcely to be regarded as philosophical. All creatures have their places in the scale of creation; and, without any one of them, the chain of existence, and it may be added of intelligence, would be incomplete. It is probable, also, that the intelligence and capacity of this animal to learn are underrated. Men are very apt, because they bestow much pains on the education of one animal, and none on that of another, to pronounce this a wonder of intelligence, that incapable of learning. It cannot, however, be denied that the bull-dog does not display the usual intelligence nor the fidelity of the dog; since he will capriciously attack his master, of whom he may, ordinarily, be morbidly fond. A proof of his distinct purpose in creation is his native antipathy to the bull; which is not akin to the propensity of all animals, particularly of all dogs, to pursue any thing which flies, but to the instinctive antipathy which induces the falconer to attack the venomous snake, the kitten to assail the mouse, and the ferret to hunt the rat—antipathies not connected with the desire of prey, and owned by the one party as intensely as by the other. In proof of this, a thorough-bred bull-pup, of 6 months, which has never seen a bull, the first time he beholds one, will run at the head, which is his invariable point of attack, and, seizing him by the lip, tongue, or eye, hang on, in spite of every attempt to detach him, and will suffer himself to be killed or even dismembered—instances of which horrible barbarity have actually occurred in what are absurdly called the good old times—rather than forego his hold. It is clear, indeed, that bull-baiting was the consequence of this natural hatred and antagonism of the 2 animals, not the cause of it. It was an old saying that 1 bull-dog was a match for a bull, 2 for a wolf, 3 for a bear, and 4 for a lion. The latter experiment was tried on a wild,

newly imported African lion, in the tower of London, some years since; when, although not one of the dogs showed a symptom of fear, or relaxed his hold, the lion annihilated them all, with blows of his paws, in a few seconds. The very propensity of the bull-dog to run at the head only, renders them useless in attack wild beasts; as it limits the number of those which can attack at once to as many as can seize at one time. If they would only lay hold on all sides, like fixhounds, nothing but a rhinoceros could resist the combined attack of a pack of bull-dogs. With the decline of bull-baiting, the demand for the bull-dog has ceased; although he is still found useful to cross with other dogs, to which he imparts courage, endurance, and tenacity of purpose. There is a large cross of the bull-dog, where it would be least expected, in the greyhound, introduced by Lord Orford, to give certain valuable qualities; and the greyhound shows it by his always running at the head of large animals, as the deer. There is, also, a probable cross in the pointer, shown in the pendulous jaw and rat tail, as well as in the determined character.

BULL-FIGHT, a Spanish spectacle, introduced by the Moors originally, and universally adopted in all the cities of the kingdom, each of which has an arena of greater or less magnificence, called *las plazas de toros*, set apart for this entertainment. The bulls are turned one by one, with many forms of pomp and solemn ceremonial, into the open space; where they are assailed, first by horsemen, called *placadores*, who attack them with the lance; then, when a dozen or more horses have been ripped up, and one or two men have narrowly escaped a similar fate—for the riders are rarely injured, since, the moment they are overthrown, a crowd of active footmen, called *chulos*, provided with crimson banners, take off the attention of the bull—they are tormented by the *banderilleros*, armed with sharp-barbed darts having fireworks and flags attached to them, until they are thickly covered with shafts, bleeding at every pore, and scorched till their glossy hides are black and crisp by the explosion of the fireworks. Then comes the last act of the tragedy, when the skilful *matador* enters the arena slowly and alone, habited in unadorned black, and armed only with a long straight sword, with which he soon gives the *coup de grace* to the tortured brute, sheathing the blade, with one sure thrust, up to the hilt in his body just at the juncture of the neck and spine. A train of mules drag out the slaughtered carcass, amid the sound of trumpets and the acclamations of the spectators; the dead or dying horses are removed; the arena is strewed with fresh sawdust; another bull is introduced; and so goes on the Spanish holiday, until perhaps 30 bulls and double that number of horses have been slaughtered to delight the populace, with whom the cry, almost identical with the *passion et cetera* of the Roman mob, is still for *pan y toros*.

BULLA (Lat. *bulła*, a bubble), the name of a genus of shells, the form of which is globose like a bubble. They are not furnished with any projecting spire. The animal which inhabits the shell is too large to be contained within it, so that the whole shell is frequently concealed beneath the fleshy covering. The *bullæ* are all furnished with a gizzard for masticating and digesting their food. This consists of 8 rough and prominent pieces of shell, connected by a cartilaginous ligament by which they are moved. By this apparatus hard substances, such as small shells, are ground and converted into food.

BULLARD, ARTEMAS, D. D., an American clergyman, born at Northbridge, Mass., June 8, 1802, died Nov. 1855. He was graduated at Amherst, in 1826, studied theology at Andover, and visited the western states as agent of the Sabbath-school society. In 1832 he was appointed general agent of the board of commissioners for foreign missions, and took up his residence at Cincinnati, making excursions over the Mississippi valley. He was installed pastor over the first Presbyterian church of St. Louis, Mo., June 27, 1838, and was one of those who perished at the railroad accident in crossing the Gasconade river in 1855.

BULLARD, HENRY ADAMS, a lawyer of Louisiana, born at Groton, Mass., Sept. 9, 1788, died in New Orleans, April 17, 1851. He graduated at Harvard college in 1807, studied law, and also many modern languages. Through his knowledge of the Spanish he became acquainted, while at Philadelphia, with Gen. Toledo, and embarked with him, as his military secretary, in an expedition to revolutionize New Mexico. Upon its failure he contrived to escape, and opened a law office at Natchitoches. He succeeded in the profession, and in 1822 was appointed one of the judges of the district court. In 1831 he was sent to congress, in 1834 became judge of the supreme court, and in 1846 removed to New Orleans, and entered upon a large legal practice. He was made professor of civil law in the law school of Louisiana in 1847, and delivered 2 courses of lectures. He reëntered congress after an absence of 16 years, and died soon after his return home.

BULLER, CHARLES, an English politician, born at Calcutta, Aug. 1806, died in London, Nov. 28, 1848. He was educated in England, graduated at Cambridge as B. A. in 1826, entered parliament for West Looe in 1830, and in the following year was admitted a barrister at Lincoln's Inn. He voted for the reform bill, which disfranchised West Looe, and in 1832 was sent to the house of commons for Liskeard, in Cornwall, which he continued to represent till his death in 1848, distinguishing himself by his support of liberal measures and by his readiness as a debater. In 1838 and 1839 he officiated as secretary of the earl of Durham, governor-general of Canada. On his return to England he was devoted to the practice of his profession, chiefly in connection with cases relating to Indian affairs. In 1841 he became secretary of

the board of control; in 1846, judge-advocate-general; in November of the same year, a queen's counsel; and in July, 1847, a member of the privy council. In Nov. 1847, he was made president of the poor-law board, but his promising career, which pointed to him as one of the future great statesmen of England, was cut short by death a year afterward. His skill in the treatment of public questions was made evident in his writings, most of which appeared in the journals of London and the leading periodicals of the country.—**SIR FRANCOIS**, an English judge, born in 1745, died June 4, 1800. He acquired some reputation by his publication relative to trials at nisi prius, which is considered a standard work, and has passed through many editions.

BULLET, or **BALL**, a round piece of lead or iron, used to load a musket or cannon. From the invention of gunpowder to the beginning of this century bullets were made spherical. The best material to make bullets is the heaviest; lead is used for musket bullets, but this substance is too dear and too scarce for cannon balls, and cast-iron, though much lighter, is generally used. Balls are made by casting; this process leaves a rough surface. This is unimportant in lead bullets, as the metal is soft and gives way; but in cast-iron balls it is a cause of wear for the cannon, and means are employed to give more finish to the surface. Numerous persons during the last fifty years have experimented on the form of bullets without marked success, till Captain Minié, of the French army, succeeded in introducing his cylindro-conical bullets. The desiderata of bullets are: 1st, that they fill exactly the bore of the gun; 2d, that when projected, they proceed with a rotary motion; 3d, that they be shaped so as to encounter the least resistance from the air; 4th, that the whole of the bullet, or at least the forward part, be of a solid substance to cut through obstacles. The Minié bullet is for rifles, and is made of lead; the shape is that of a cylinder of nearly the diameter of the rifle, one end of which comes to a point in a conical shape, and in the other end a curved recess is left. The effect of powder, when firing, is to expand the thin portion of lead around the recess, and to make it fit tightly in the grooves of the rifle. Lead bullets have been made with a steel point. The expansion of lead to make the bullet fit has been produced by inserting in the end of the bullet a cone of iron, which was forced in by the expansion of powder, at the first instant, before the inertia of the bullet had been overcome. The best cannon ball was patented in 1858, in the United States, by S. M. Sigourney; it is cast of the shape of Minié's bullet without the recess at one end; it is a cone and a cylinder on a common basis; the cylinder is smaller than the bore of the cannon, except at the top and bottom, where rims are left projecting a quarter of an inch; between these rims there are, on the body of the cylinder, three ribs, shaped like the grooves in the bore, projecting sufficiently

to fill these grooves. After being cast, the ball is placed on a lathe, where the size is turned to the exact diameter of the bore, and where a peculiarly made planing tool cuts the ribs to the proper shape and angle to correspond with the grooves. This ball, placed in the gun, fits perfectly, and only the turned and planed portions of its surface are in contact with the cannon. It has been lately discovered that the rotation of a bullet combined with the force of gravity produces a motion sideways; this fact was yet but little known, but will at some future time be the occasion of improvements. The best form of a bullet is identical with the best form of a vessel, both being bodies cutting their way through fluids the resistances of which obey the same physical law. The best known shape for the base of a vessel is that of a dipper, that is, a convex curve. It has been also found that the shape of the stern has much to do with the velocity of a ship. It seems that those who devise bullets have not made these remarks, and that there is yet room for improvements. Various machines have been contrived for producing bullets from the bars of lead; some by casting them in moulds, and others by forcing the bits of lead into dies, and by compression giving to them their form. One of these machines, recently invented by Mr. Wm. H. Warr, of Auburn, N. Y., cuts the pieces for the bullets from lead-wire of suitable size regularly fed to it, and compresses them into any sort of bullet, for musket, pistol, or rifle, that is required. Eight bullets are produced by every revolution of the machine; and this is capable of being worked up to 25 turns in a minute. The bullet adopted for the U. S. "rifle musket," which is to supersede the old gun musket, is an elongated, hollow, pointed ball, weighing 497 grains.

BULLETIN (fr. *bulletine*), a word derived immediately from the French, and the diminutive of the low Latin *bulle*. In the French army, the public despatches of the general are called bulletins. Many learned societies call their transactions bulletins, among others the St. Petersburg and Belgian academies, and the archaeological institute of Rome. The authorized collections of the laws and ordinances of the French government were once called *bulletin des lois*. The tickets on which the voter inserts his vote are termed in France *bulletins*.

BULLFINCH (*pyrrhulox rubicilla*, Pall.), a bird of the finch family, a native of northern and temperate Europe. The bill is remarkably short and thick, of a black color, and convex in all its outline; the head is large, the neck short, and the body stout. The length of the male bird is 6 inches, the extent of wings 10 inches, the bill about one-third of an inch. The plumage is soft; around the base of the bill the feathers are hoistly, concealing the gonyx; the third quill of the wing is the longest; the tail nearly straight, consisting of twelve broad rounded feathers. The eyes are

dark brown, the feet dusky, the claws brownish black. The upper part of the head and a band at the base of the lower jaw are glossy bluish black; the hind neck, back, and scapulars ashy gray; the rump and lower tail coverts white; the upper coverts and tail bluish black; the quills and primary coverts are brownish black, the outer webs of the secondaries being glossed with blue; the secondary coverts are tipped with gray or grayish white, forming a bar on the wing; the cheeks, front of the neck, breast and sides are light crimson; the belly grayish white. This is the ordinary male plumage, which in captivity becomes sometimes very dusky. The female is a little smaller; the coloring is similar, but the tints are much duller; the parts which are red in the male are dull grayish brown in the female. The bullfinch is fond of wooded and cultivated districts, avoiding barren tracts near the sea and bleak islands; it is gregarious, but seldom associates with other birds; it is not migratory, but frequents the woods and thickets of England during the whole year. Its flight is quick and undulating; its notes are soft, low, plaintive, and mellow; it is often caged for its beauty, and in captivity becomes very docile, and may be taught a variety of tunes. During the greater part of the year it lives in the thickets and woods, occasionally visiting the fields in search of seeds. In the spring it is very destructive to the buds of the gooseberry, cherry, plum, and other fruit trees. It begins to build its nest in the beginning of May, of small, dry twigs and fibrous roots, generally in a thorn bush, thick hedge, or bushy spruce; the eggs 4 or 5 in number, are of bluish or purplish white color, speckled and streaked with purple and reddish brown. The young at first resemble the female, but without the black on the head; the male does not assume the full red tint until the second year.

BULLHEAD, the popular name of several species of catfish fishes, principally of the genera *catfish* and *acanthopterus*, inhabiting both fresh and salt water. All were formerly confounded in the genus *catfish*, but Mr. U. Girard ("Smithsonian Contributions to Knowledge," vol. iii.) has separated them, restricting the genus *catfish* to the fresh-water species, while he gave the name *acanthopterus* to the marine species, more commonly called sculpins. These two groups are distinguished very easily: the head of the former is smooth or nearly so, that of the other is tuberculous or armed with spines; the former is not found in salt water, nor the latter in fresh, though it is sometimes found in the brackish water of the mouths of rivers. For the minute characters of the genera and species, the reader is referred to the work above alluded to, and to the "Proceedings of the Boston Society of Natural History," vol. iii, p. 168. The most obvious characters are the following: In *acanthopterus*, the opercular apparatus is armed with strong spines; the surface of the head, and often the circumfer-

ence of the orbits, is similarly armed, or is serrated in various ways; the nasal bones are in some species surmounted by a ridge or spine; the head is high and broad, occasionally deformed, with very large eyes and an immense mouth; the body is without scales, the back often arched, and the first dorsal almost as high as the second; the soft rays are 3 or 4 in the ventral fins; the lateral line runs uninterrupted and distinct from the head to the base of the tail; in the cottoids, the lateral line is remarkably developed, being in some a regular cartilaginous tube with a series of openings communicating by pores of the skin with the surrounding water, leaving no doubt that this line in fishes is intended to supply water to the system. The common bullhead or sculpin (*A. Virginianus*, Willoughby) is well known to every boy as a perfect pest and scarecrow among fishes. The body is of a light or greenish brown above, with irregular blotches arranged as 4 transverse dark brown bars; the abdomen is white, occasionally stained with fuliginous; the dorsals are crossed by dark brown bands, the pectorals light yellow with concentric brown bands, and the ventrals, anal, and caudal yellowish white, also banded. The length is from 10 to 18 inches, of which the head is about one-third. There are 10 naked spines on each side, on and about the head, the largest being at the posterior angle of the preoperculum, and partially covered with a loose membranous sheath; there are also strong scapular and humeral spines, so that it is rather a difficult species to handle; the gape of the mouth is large, and the jaws, pharynx, and palate are armed with numerous sharp, card-like teeth; the caudal fin is even at the end. This species is found from New Brunswick to Virginia. Another species of the New England coast is the Greenland bullhead (*A. varidilis*, Gd., and *A. Groenlandicus*, Cuv.); these may be different species, but they are described under one head by Dr. Storer, in his "Fishes of Massachusetts," in "Memoirs of the American Academy," vol. v. p. 74. This is darker colored than the common sculpin, with large clay-colored blotches on the top of the head and gill covers, smaller ones on the back and sides, and circular yellow spots on the sides near the abdomen, which is yellow tinged with red, and the throat dull white; the fins are more or less banded and spotted with yellow; the sides are rough from granulated tubercles. The length is about a foot, of which the head is one-fourth; this is armed with spines. These ill-favored sculpins are the favorite food of the Greenlanders, though rarely, if ever, eaten by us. They are very troublesome in the fishing grounds of the British provinces, and often compel the vessels to remove to another place, as experience proves that their presence drives away all desirable fish. The bullheads are very voracious, devouring small fish, crabs, echinoderms, mollusks, and almost every thing, even decaying matter that comes in the way. There

are several other American species described by Mr. Girard. The genus *cottus* (Artedi) has but one small spine at the angle of the preoperculum, and sometimes another smaller, hidden under the skin, and perceptible only to the touch, at the lower margin of the suboperculum; the head is depressed, truncated in front, and broader than high; mouth less deeply cleft than in *acanthocottus*, but, like that, having teeth on the intermaxillaries, lower maxillaries, and front of the vomer; body smooth, gradually tapering to the tail; second dorsal higher than the first, ventrals with 3 or 4 soft rays; lateral line generally interrupted. The river bullhead (*C. gracilis*, Heckel.) rarely exceeds 8 inches in length, and is of a light green color, with irregular dark brown blotches, largest posteriorly; it is found in the New England states and New York. The *C. viscosus* (Hald.) is about 4 inches long, and inhabits eastern Pennsylvania and Maryland; the color is yellowish, clouded with black, the first dorsal fin being edged with a narrow line of orange; it receives its name from the uncommon alminess of the skin; it delights in clear spring waters with pebbly bottoms, and lies concealed under stones and stumps, close to the bottom, and, when disturbed, hastens to a fresh cover; the eggs are laid in April and May, in round packets about the size of an ounce bullet, under boards and stones; it is supposed that they are watched by the parent, from her having been found under the same cover. Many other species, all small, are described by Mr. Girard as American; others are found in the colder portions of the temperate zone in Europe and Asia, at least 6; it is probable that many have been confounded under *C. gobio* (Linn.). The family of cottoids appeared on the earth some time during the last period of the cretaceous epoch, the genus *cottus* appearing in the tertiary. There is a cottoid in the Columbia river, called the prickly bullhead, for which Mr. Girard has established the genus *cottopsis*, resembling the marine species in its size, but the fresh-water species in its smooth head; the body is beset with prickles, there is one preopercular spine on each side, and the teeth of the palatic bones are card-like; its length is from 9 to 10 inches; it is the *C. asper* (Gd.). The name of bullhead is also given to some species of *aspidophorus* (Lacép.), and *hemitripterus* (Cuv.), marine genera, extending from the New England coast to the Greenland seas.

BULLINGER, HENRICH, a Swiss Protestant theologian, born at Bremgarten, July 18, 1504, died in Zürich, Sept. 17, 1575. He associated himself with Zwingli, and became his successor as pastor at Zürich in 1531. He took an active part in the theological discussions of the time, was one of the authors of the first Helvetic confession in 1536, and was sole author of the second Helvetic confession. He was the principal cause of the close relations established in the reign of Edward

VI. between the Anglican and the Swiss churches.

BULLITT, a northern county of Kentucky, with an area of 250 sq. m. It is watered by Salt river, and the Rolling Park of that river touches its S. W. boundary. The surface is hilly and the soil fertile. Pine woods abound, and there are numerous mines of superior iron ore. The productions in 1850 were 418,530 bushels of Indian corn, 53,295 of oats, 2,000 lbs. of tobacco, and 18,146 of wool. There were 25 corn and flour mills, 10 saw mills, 4 tanboats, 2 iron furnaces, several woolen factories, 10 churches, and 150 pupils attending public schools. Value of real estate in 1855, \$1,443,198. The county is traversed by a railway designed to connect Louisville (Ky.) with Nashville. Pop. in 1850, 6,784, of whom 1,365 were slaves. Capital, Shepherdsville.

BULLOCK, an eastern county of Georgia, lying between the Ogeechee and Canoochee rivers, and covering an area of 900 sq. m. The climate is healthy, the surface is generally level, but the soil is poor and sandy. Cotton, rice, sugar, and corn are the chief productions. The pine forests which cover a large portion of the county abound in game. Capital, Statesborough. The productions in 1850 were 112,475 lbs. of rice, 60,610 bushels of sweet potatoes, 98,512 of Indian corn, and 2,237 of oats. There were 12 grist mills, 2 saw mills, 10 churches, and 256 pupils attending public schools. Value of real estate in 1856, \$590,839. Pop. in 1855, 4,541, of whom 1,696 were slaves.

BULLS, in stock-exchange parlance, see BEARS and BULLS.

BULMER, WILLIAM, an English printer, born at Newcastle-upon-Tyne, in 1745, died at Clapham, Sept. 1820. He labored for some time with John Bell, in London, who published some fine miniature editions of the British poets. He was subsequently put at the head of Nicol's establishment for the printing of a magnificent edition of Shakespeare, the first numbers of which appeared in 1791.

BULOLA, a river of Senegambia, western Africa. It passes through the country of the Biaferes and empties into the Atlantic. On a small tributary of this river, 60 miles distant from the sea, stands the town of Bulola.

BÜLOW, FERDINAND WILHELM, Count von Dornowitz, a Prussian general, born Feb. 10, 1756, died Feb. 25, 1816. At the earliest period of Napoleon's European wars, he was engaged against him. In 1808 he was made a general of brigade. In 1813 he was enabled for his victories at Möckern, Luckau, Gross-Boeren, and Dornowitz. He subsequently distinguished himself in Westphalia, Holland, and Belgium, and contributed essentially (as Wellington warmly acknowledged) to the victorious close of the battle of Waterloo, in which he commanded the 4th division of the allied army.—HEINRICH, baron, a Prussian diplomatist, born at Schwerin in 1790, died in Berlin, Feb. 6, 1846. While a student at Heidelberg, in 1815, he was called home to take

part in defending his country from the French. After serving in various engagements under Crown Prince Waldemar, he returned to Heidelberg to complete his studies. Through the joint influence of Prince Hardenberg and Wilhelm von Humboldt (whose daughter he afterward married), he was allowed to enter the diplomatic service of Prussia. From 1826 to 1841 he officiated as Prussian ambassador in England, and took an important part in the conventions of 1830 and 1840 on the French, Belgian, and Oriental questions. From 1841 to April, 1842, he acted as Prussian ambassador to the German diet in Frankfurt, and from the latter period to 1845 as minister of foreign affairs in Berlin.

BULKUSH (*Scirpus lacustris*, Linn.), an aquatic plant, with a large cylindrical stem from 3 to 8 feet high, the sheath often bearing a small, linear, awl-shaped leaf, and the culm tipped with an erect and pointed involucral leaf. It has numerous spikes in a compound umbel-like panicle, and ovate, sword-shaped scales. It is a native of Europe, and is now common in rivers and ponds on the continent, in England, North America, and New South Wales. The root was formerly used in medicine for its astringent and diuretic qualities. The leaves and stem are tough and fibrous, and are employed for thatching, and making matting and chair-bottoms.

BULSAR, or **BULSAVA**, a thriving town in British India, district of Surat, presidency of Bombay. Many of the inhabitants are weavers and sellers; others are engaged in agriculture. Cloths are manufactured here, and an active trade is carried on in grain, timber, sugar, and salt. The estuary of the river Bulsar, on which the town is situated, is obstructed by a bar. Pop. 7,000.

BULTI, or **BULTIBYAN**, or **LITTLE THIBET** (Iskardoh), a state of central Asia, tributary to the rulers of Cashmere, in the north-western part of the mountainous curve of the Himalayas, forming the north-eastern boundary of Hindostan. It is on the N. slope of the chain, and in the valley of the Indus. It is the N. W. part of the little division laid down on our present maps as central Thibet (Lutskh). It is a table-land, 5,000 feet above sea level, and the surrounding peaks rise 7,000 feet higher. The climate is therefore cold, though European fruits abound. The inhabitants are Tartars, and their religion Mohammedan. The land was subdued by Gholab Singh in 1648. Until then it was an independent state, the last independent ruler having been Ahmed Shah. The area is estimated at about 12,000 sq. m. and the population at about 75,000. The capital is Iskardoh.

BULBORGURH, or **BALLANAGURH**, the principal town in the jaghira of Bulboghur or Pursoodabad, under the lieut.-gov. of the North-West Provinces, Hindostan. The jaghira, which is governed by a rajah of the Jait tribe, extends for 26 miles along the right bank of the Jumna, and is bounded N. W. by Delhi; E. and N. E.

by Boolnundshahur; S. and S. W. by Goorgaon. Area, 190 sq. m.; pop. about 57,000. At one period (about 1880), during the minority of the hereditary chief, the tract was taken under British management, but was restored to the rajah on his coming of age, and its relations to the British are now but imperfectly understood. The annual revenue of the state is estimated at 160,000 rupees, and the annual expenditure at 130,000. The military force consists of 100 cavalry and 350 infantry. The town of Bulubgurh, situated on the road from Delhi to Muttra, 29 miles S. of the former city, in a pleasant, well-cultivated country, is tolerably well built, but small. The streets are narrow, the houses tall, and the temples numerous. The palace of the rajah is a neat edifice.

BULWER, SIR HENRY LYTTON EARLE, an English diplomatist, born in 1804, is an elder brother of Sir Edward Bulwer Lytton. He was educated for public life, and, in 1827, was attached to the British embassy at Berlin, and in 1829 to the embassy at Vienna. He was sent to Brussels in 1830, to watch the progress of the Belgian revolution. In the same year he was returned to Parliament for the borough of Wilton, and in 1831 for Coventry. In 1832 he was attached to the British embassy at Paris; represented the metropolitan borough of Marylebone from 1834 to 1837; was made secretary of legation at Brussels in 1834, and subsequently filled the same office at Constantinople and Paris. He remained at the latter place until 1843, when he was sent to Madrid as envoy extraordinary and minister plenipotentiary, where he negotiated the peace between Spain and Morocco in 1844. During the disturbances in Spain in 1848, he was the medium, more than once, of conveying to Gen. Narvaez the remonstrances of the British government on the arbitrary system he was pursuing. Narvaez, who knew his sympathy to be with the liberals, accused him of complicity in certain plots said to be formed against the Spanish government, sent him his passport, and insisted on his quitting Spain. The British government marked their sense of this treatment by naming Mr. Bulwer a knight of the bath; by dismissing Señor Isturitz, the Spanish ambassador in London; and by withholding the appointment of an ambassador to Madrid for nearly 2 years, when Lord Howden was appointed. It is said that Narvaez eventually made an apology, the terms of which were dictated by Lord Palmerston. In 1848, Sir Henry Bulwer married the youngest daughter (born in 1817) of the first Lord Cowley, and niece to the duke of Wellington. In April, 1849, he was sent as ambassador to the United States, and in that capacity negotiated the Clayton-Bulwer treaty. He was transferred to Tuscany in 1852, as envoy extraordinary, and held that appointment until January, 1856. He was subsequently sent on a special mission to the East, and in 1858 was appointed ambassador at Constantinople.—Sir Henry Bulwer, in parliament, was a frequent and fluent speaker,

and has always held liberal opinions. He is an author as well as a politician, having published "An Autumn in Greece;" "France, Social and Literary;" "The Monarchy of the Middle Classes," and a "Life of Lord Byron," prefixed to a Paris edition of the poems.

BULWER, JOHN, an English physician, born 1596, died in the first part of the 17th century, who devoted his life to the humane employment of discovering and applying means of instructing the deaf and dumb. His first works on the art of speaking on the fingers (*Chironomia* and *Chirologia*) appeared in 1644.

BULWER, ROSINA (LADY BULWER LYTTON), born in Ireland in 1807, married to Sir Edward (then Mr.) Bulwer, Aug. 29, 1827. She was granddaughter of Hugh, 2d Lord Massy, of Duntryleague, co. of Limerick, Ireland, and only surviving daughter of Mr. Francis Wheeler, of Lizzard Connell, in the same place. After living with her husband for several years, a separation took place. Lady Bulwer Lytton, who had decided literary tastes, occasionally contributed to magazines during the first years of her wedded life. A classical sketch, in prose, entitled "The Supper of Sallust," appeared in an early volume of "Fraser's Magazine." In 1839 was published her first novel, "Cheveley, or the Man of Honor," to which have succeeded "The Budget of the Bubble Family;" "Bianca Capello," an Italian story; "Memoirs of a Muscovite," a tale of modern Italian life; "The Peer's Daughters," illustrative of the age of Louis XV.; "Behind the Scenes;" "The School for Husbands, or the Life and Times of Molière," and "Very Successful." A new novel from her pen appeared in 1858. Its title is, "The World and his Wife; or, a Person of Consequence." Five of these works are vehicles, under a very thin guise of fiction, for satire and abuse of the author's husband, and his mother and brother. A pamphlet, circulated during the parliamentary session of 1857, sets forth, more plainly and particularly, the grounds, real or assumed, of Lady Bulwer Lytton's quarrel with and separation from her husband. On June 18, 1858, she created not a little excitement at Hertford, by making her appearance at the hustings, for the purpose of confronting her husband, who was addressing his constituents. Her historical novels, though overloaded with quotations in various languages, dead as well as living, show considerable acquaintance with the lives and characters of eminent personages, as well as of the countries in which they lived. Two children were the fruit of Lady Bulwer Lytton's marriage. One of these, a daughter, died in youth. The other, **EDWARD ROBERT**, born in 1831, heir to his father's title and estates, was attached to the British embassy at Washington (under his uncle, Sir Henry Bulwer), in 1849; was transferred to Florence in 1852; and in 1856, under the *nom de plume* of Owen Meredith, published a volume entitled "Clytemnestra, the Earl's Daughter, and other Poems."

BULWER LYTTON, Sir EDWARD GEORGE EARLE LYTTON, an English novelist and politician, born at Haydon Hall, in the county of Norfolk, in 1803. He is the 3d and youngest son of the late Gen. William Earle Bulwer. His mother was heiress of the Lyttons of Knebworth, Hertfordshire. She had strong literary tastes, and contributed greatly to the formation of her son's mind. His father died when the future novelist was yet young. He was educated by private tutors, and entered Trinity hall, Cambridge, where he graduated in 1825. At the university he gained the chancellor's prizes for English versification by a poem on "Sculpture" (1825). A friend at Cambridge, who had resided at Weimar, directed his attention to the beauties of German literature, which he set himself to study. He occupied his vacations by pedestrian tours through England and Scotland and by a jaunt on horseback over a great part of France. In 1825 he published a collection of his youthful effusions, entitled "Woods and Wild Flowers." In 1827 appeared a Byronic poem, entitled "O'Neil, or the Rebel." In 1827 his first novel, "Falkland," was published anonymously, followed, in 1828, by "Pelham, or the Adventures of a Gentleman." "Pelham" was adversely criticised in many quarters, but conveyed a general impression of originality and power. Next came the "Disowned," and, in 1829, "Devonia;" in 1830, "Paul Clifford;" and in the next year, a satirical poem entitled the "Mansons Twins." "Eugene Aram" appeared in 1834; "England and the English," in 1835; the "Student," in 1836. Previous to this he had been for some time editor of the "New Monthly Magazine." In 1844 appeared the "Pilgrims of the Rhine" and the "Last Days of Pompeii;" in 1845, "Rienzi, the Last of the Tribunes." In 1857 he wrote "Athens, its Rise and Fall," a work of historical criticism, and "Ernest Maltravers," and the continuation of the same, "Alice, or the Mysteries," in 1858; "Lalla, or the Siege of Granada," appeared in 1840; "Night and Morning," 1841; "Zanoni," 1842; and the "Last of the Barons," 1843. In 1836 he first entered the lists as a dramatic writer. The "Duchess de Valiere" was a failure, but the "Lady of Lyons" and "Richard III" were, on the other hand, very successful. "Money," a later comedy, was also well received. The "Poems and Ballads of Schiller," translated into English metre, appeared in 1844. "Eva, the Ill-omened Marriage, and other Tales and Poems," preceded the last-named. "Ingroia, or the Children of the Night" (1846), another romance, was condemned by the critics as being too full of horrors. Bulwer published a pamphlet in its defence, entitled "A Word to the Public." The "New Tithes," a satirical poem, and "King Arthur," an epic, were published anonymously, the latter in 1848. "Harold, the Last of the Saxon Kings," was published in the same year. In 1850 appeared his "Claxtons," a domestic novel of English high life, first published periodically

in "Blackwood's Magazine." "My Novel, or Varieties of English Life," was in the same style and equally well received. Meanwhile, in 1844, he had succeeded to the Knebworth estates of his mother, and exchanged, by royal license, his surname of Bulwer for that of Lytton, which he now bears. In 1851 he wrote "A Letter to John Bull, Esq., on Affairs connected with his Landed Property and the Persons who live thereon," in which protectionist views were advocated. In 1845 he wrote the "Confessions of a Water-patient, in a Letter to W. H. Ainsworth, Esq.," in which he recommended the water-cure to overworked literary men. He took great interest in the founding of the guild of literature and art, at whose service he placed a small portion of his estate, and for which he also wrote "Not so Bad as we Seem, or Many Sides to a Question" (1852), a five-act comedy performed by a company of amateur actors. In 1850 he was elected lord rector of the university of Glasgow in opposition to Lord Stanley, and delivered an inaugural address advocating the study of the classics, and rejoicing over the increased weight of British literature in the intellectual balance of the world, as compared with the state of things in the 18th century. In 1857 he began to publish in "Blackwood's Magazine" a new novel, "What will he do with it?" No living English writer is more read on the continent of Europe than Bulwer. His works have been translated into nearly all the living languages of Europe. In America he has found republishers in Boston, New York, and Philadelphia.—Mr. Bulwer entered the house of commons as member for the small borough of St. Ives in 1831. He joined the ranks of the reformers. In 1832, when St. Ives had been deprived of its representative by the reform bill, he was elected by the city of Lincoln, which he continued to represent until 1841. He did not acquire in parliament any general influence. His efforts to relieve newspapers from the stamp duties and his speeches on the copyright question are the only points of his parliamentary career at this period of his life which have not passed into oblivion. He adhered rather to the radical than to the whig branch of the liberal party. In 1855 he published a political pamphlet, entitled the "Creed," which ran through 7 editions, and was very serviceable to the whigs. He was created a baronet in 1838. He was defeated by the conservative candidates for the borough of Lincoln in June, 1841, and again in July, 1847. Having resumed parliament as a member for the county of Herts, in the general election of 1853, as a conservative and supporter of the earl of Derby, he soon distinguished himself by some lively and well-put opposition speeches, and rose to the position of an ornamental leader of the party. In 1855 he supported the repeal of the penny-stamp duty on newspapers in opposition to the bulk of his political associates. At the general election of 1857 he was again

returned as member for Herts. In June, 1858, he became a member of the Derby cabinet as successor of Lord Stanley in the office of secretary of state for the colonies.

BUNAISSOR (anc. *Vansiwara*), a town in the presidency of Bengal, British India. It is now in ruins, and is said to contain a great number of temples, one of which surpasses in size the famous temple of Juggernaut.

BUNCOMBE. I. A county of North Carolina, near the border of Tennessee; area, 450 sq. m., occupied in great part by mountains and valleys of the Appalachian system. The Blue Ridge is on or near the S. E. boundary. The French Broad river is the principal stream. The soil is fertile, and affords excellent pasturage. In the N. W. part are celebrated warm springs. The productions in 1850 were 487,014 bushels of Indian corn, 27,548 of wheat, 185,804 of oats, 8,248 tons of hay, 127,677 pounds of butter, and 1,899 of tobacco. There were 86 corn and flour mills, 7 saw mills, 2 newspaper offices, 44 churches, and 4,682 pupils attending public schools. Value of real estate in 1857, \$1,164,265. The county was formed in 1791, and named in honor of Col. Edward Buncombe, an officer of the continental army. Pop. 13,425; 1,717 being slaves. Asheville is the capital. The origin of the phrase, "talking for Buncombe," is thus explained: "Several years ago, in congress, the member from this district arose to address the house, without any extraordinary powers, in manner or matter, to interest the audience. Many members left the hall. Very naively he told those who remained that they might go too; he should speak for some time, but 'he was only talking for Buncombe.'" (Wheeler's History of N. C.) II. A north-western county of Iowa, bordering on Minnesota, and having an area of 800 sq. m. The Inyan Reakah river intersects it, and the Sioux forms its W. boundary. In the E. part is Ocheyedan lake. The county is not included in the census of 1856.

BUNDELOUND, or the **BUNDELA COUNTRY**, an extensive province of Hindostan, between lat. 23° 52' and 26° 26' N., long. 77° 53' and 81° 39' E. Area, 18,099 sq. m.; population, 2,260,714. It comprises the British districts of Bandah, Hummerpoor and Calpee, Jaloun, Jeitpoor, Churgaon, Duboi, and Guota, and a number of petty native states and jaghires, all under British protection. Up to 1857, it was included in the North-West Provinces, but on the overthrow of the lieutenant-governor's authority by the sepoy revolt, it was erected, with Goruckpoor, Benares, Allahabad, the Lower Doab, and Sangor, into a new government called the Central Provinces, of which Mr. Grant, a member of the supreme council, was appointed lieutenant-governor. It is a hilly country, traversed by the 3 ranges of the Bindyachal, Bandair, and Punna, the last of which is rich in diamonds and coal. From these mountains flow numerous rivers, including the Betwah, Desan, and Cane, all affluents of the Jumna, which flows along the N. E. boundary. The

soil produces almost every kind of grain and fruit known in India. The climate is healthy in some places, but in others, chiefly in the W., is fatal to Europeans. The chief towns are Calpee, Bandah, Jhansi, Duttea, Oorcha, Jaloon, and Callinger.—The earliest dominant power in Bundelcund, of which there is certain record, is that of the Chundel Rajpoots, from the 9th to the 12th century. Under them the country reached its culminating point of prosperity, and on their decline was occupied by the Bundelas, a branch of the Garwha tribe of Rajpoots. About 1784 the district of Jhansi and a third part of eastern Bundelcund were made over to the peishwa, in consideration of services rendered by him in a contest with the emperor of Delhi. The remainder of the country gradually became divided into petty chieftainships; incessant wars naturally followed; and in 1792 the Mahrattas made a partially successful attempt to subjugate the entire territory. Soon after, the peishwa ceded to the British the districts of Hummerpoor and Bandah, and in 1817 by the treaty of Poonah made over to them all his remaining possessions in Bundelcund. The power of the East India company was not established in the ceded districts without much resistance from the secondary chieftains, but after their pacification the country remained comparatively tranquil until 1857. It was seriously affected by the sepoy rebellion, though the native princes are said to have generally sided with the British. Mutinies took place at Jhansi (June 4), Nowgong (June 10), and Bandah (June 14). The rising at the first of these places was attended with the massacre of about 70 Europeans, among whom were 19 women and 23 children. The Europeans at Nowgong escaped by flight, and those at Bandah were protected by the nawab of that place, a titular prince who receives a pension from the E. I. company. Sir Hugh Rose recaptured Bandah, Jan. 31, 1858, and stormed Jhansi, after a siege of 12 days, April 4. Our latest accounts (July, 1858) left him marching toward Calpee, where the sepoys had meanwhile been gathering in great force. He was opposed on the route by a body of 7,000, commanded by the rane of Jhansi and a brother of the Nena Sahib, whom he defeated in a pitched battle.

BUND-EMIR, or **BUND-EMIR** (anc. *Araxes*), a Persian river, rapid and apt to inundate its banks. It is 150 miles long, and empties into Lake Bakhtegan.

BUNGE, **ALEXANDER**, a Russian botanist and traveller, born at Kiev, Sept. 24, 1803. He was educated at Dorpat, and after taking the degree of M. D., in 1825, he travelled in Siberia and the eastern part of the Altai mountains, and then joined the mission of the academy of St. Petersburg to Peking. He remained 8 months at Peking, and procured an extensive herbarium. In 1833, by invitation of the academy of St. Petersburg, he made a second Asiatic journey, and in 1836 settled as professor of botany at Dorpat. His principal publications are catalogues of the plants which

he collected in China and near the Alai mountains.—FRANCIS GRISON, brother of the preceding, a historical writer upon law, born at Kiev, March 1, 1802. He was educated at Dnepat, and since 1831 has been professor of law there; and since 1842 has been burgo-master of Revel. His writings, principally upon the history of law and rights in the countries around the Baltic sea, are numerous, and valuable.

BUNION, a swelling on the inside of the first joint of the great toe, is caused by the pressure of tight boots or shoes. The same term is sometimes applied to a similar kind of swelling on the first joint of the little toe, or on the instep. Those who are troubled with bunions have the great toes turned outward and the little toes inward to an unnatural extent, from wearing boots or shoes too narrow at the extremities, which force the toes out of their natural position. The proper remedy is to wear loose boots or shoes made of cloth or of soft leather, with sufficient room for the free movement of the toes and space enough for the bunions. High heels should also be discarded, as they throw the feet forward in the boot, and thus increase the pressure on the instep and the toes. When a bunion is not inflamed, the pressure may be partially removed by applying over it and the surrounding parts a piece of thin linen or silk spread with diachylon plaster, and over the latter a piece of thick buckskin leather of the same dimensions, also covered with diachylon, and perforated with a hole the size of the bunion; the pressure is thus thrown on the adjacent parts. Much walking in warm weather may bring on inflammation of the bunion, which then becomes painful; in which case poultices, fomentations, or leeches may be necessary; or if matter forms, the lancet may be required to give vent to it.

BUNKER HILL, a round, smooth elevation in Charlestown, Mass., 110 feet high, commanding the peninsula of Boston. It was connected by a ridge on its southern slope with Breed's hill, about 75 feet high, the crests of the 2 hills being about 700 yards apart. These heights are famous for the battle fought on them between the British and American forces, June 17, 1775. The city of Boston was at that time occupied by the British under Gen. Gage, who had recently received large reinforcements under Generals Howe, Burgoyne, and Clinton. Around Boston, having their headquarters at Cambridge, were the minute men of Massachusetts and various bodies of militia and parties of volunteers, as yet independent of each other, obeying their several commanders, knowing little of military discipline, united only by their devotion to the common cause, but of which Washington in person was soon to take command. Gen. Artemus Ward, the military head of Massachusetts, was, however, in general regarded as commander-in-chief, with Prescott, Putnam, Gridley, Stark, and

Pomeroy, who had learned the art of war in the old contests between England and France, served under him. The beleaguered and now reinforced British, had determined to begin offensive operations against the rebels. This design became known in the American camp, where the daring counsels of the officers and the inexperienced eagerness of the soldiers at once suggested the project of anticipating any movement of Gen. Gage. It was determined to seize and fortify the heights of Charlestown on the night of the 16th of June, and Col. William Prescott, of Pepperell, whose military port, garb, and reputation alike gave him consequence, received command of a brigade of 1,090 men to execute this perilous enterprise. The detachments paraded soon after sunset, on Cambridge common, where prayers were offered up by Langdon, the president of Harvard college. At about 9 o'clock they began their march toward Charlestown, and near the isthmus called Charlestown neck were joined by Major Brads and Gen. Putnam, and by the wagons laden with intrenching tools. Prescott conducted them undisturbed up the ascent of Bunker hill, and thence, after a consultation, to Breed's hill, which was nearer to Boston, and had better command of the town and shipping. There the lines of a redoubt were marked out, and a little after midnight the first and was thrown up. Twice during the night Prescott repaired to the water's edge to be sure that his party was unobserved, and heard the drowsy country's cry from the decks of the British men of war, "All's well." At dawn of day a strong redoubt, backed on the left by a breastwork which extended northerly toward a piece of low land called the Slough, was already completed, and was copied from the ships in the harbor. These immediately brought their guns to bear upon it, and the cannonade awaked the citizens and occupants of the town, who crowded to gaze with wonder upon the bulwark which had so silently and suddenly sprung up. Gen. Gage with his telescope descried the tall figure of Prescott walking the parapet and encouraging the men, and asked quickly, "Will he fight?" "Yes, sir, to the last drop of blood," was the answer from one who knew him. Meantime, amid an incessant shower of shot and shells, on one of the hottest days of the season, after having toiled all night, and possessing but scanty supplies, the Americans steadily pursued their work till about 11 o'clock. At that time the intrenching tools were removed by Putnam to Bunker hill, with the design of forming a new breastwork there. Prescott strengthened his right flank by some troops thrown into the village of Charlestown at the southern foot of the hill, and on the left, at the very moment of battle, a fortification against musket balls was completed by the intertexture of 2 rail fences and the new-mown hay of the meadows. While the military din and clatter which reached from the streets of

Boston announced an impending attack, Prescott repeatedly sent messages to Cambridge asking for reinforcements and provisions, and Putnam went in person to urge the exigencies of the case. Yet Ward hesitated to expose his stores and to risk a general engagement by weakening his main body, and it was not till 11 o'clock that orders from him reached Stark at Medford to advance to the relief of Prescott. This veteran was at the head of 500 New Hampshire troops, and wisely and warily led them on at a moderate pace, determined to bring them fresh into battle. He appeared on the heights at about 2 o'clock, and took his position on the left to maintain the rustic bulwark which reached toward the Mystic. At the same time Warren arrived, and after declining the command, which was tendered to him by Putnam at the rail fence, and by Prescott on Breed's hill, entered the redoubt as a volunteer, and was cheered by the troops as he selected the place of greatest danger and importance.—Already the British army of assault had landed. Gen. Gage had decided, in opposition to a majority of his council, to attack the Americans in front instead of in rear, in the conviction that raw militia would flee before an assault of veterans. At about 1 o'clock, in plain sight of the Americans, 28 boats and barges, containing 4 regiments of infantry, 10 companies of grenadiers, 10 of light infantry, and a proportion of field artillery, in all about 2,000 men, bore away from Boston under cover of a heavy fire from the ships in the harbor, and landed without opposition at Moulton's Point, a little to the north of Breed's hill. Gen. Howe commanded the right wing, which was to push along the bank of the Mystic river, and attempt to force the rail fence, and so to outflank and surround the whole American party; Gen. Pigot commanded the left wing, which was to mount the hill and force the redoubt. Reinforcements were on their way toward the American lines during the whole day, but the whole number who arrived in time to take part in the action did not exceed 1,500 men. Prescott commanded upon the redoubt, Knowlton and Stark on the left, and Putnam was active and efficient, in various ways, now planning additional fortifications on Bunker hill, now scouring the whole peninsula to hurry up reinforcements, and now mingling with, encouraging, and threatening the men at the rail fence. The 2 columns of the British, after partaking of refreshments, advanced to a simultaneous assault at a little after 2½ o'clock. With their scarlet uniforms and flashing armor they presented a formidable appearance, and Gen. Pigot's division ascended the hill in good order, discharging their musketry, and galled only by a flanking fire from the Americans in Charlestown. The men in the redoubt, obedient to the strict command of Prescott, withheld their fire till the enemy had approached within 8 rods, when a tremendous volley was discharged, and nearly the whole front rank of the British

fell. The assailants, recoiling for a moment, again advanced, and were met by a second volley more effective than the first. The Americans were all marksmen, and for a few minutes an unremitting fire was kept up between the 2 armies, till the British staggered and retreated in disorder, some of them even to their boats. Gen. Howe's division had in like manner moved gallantly forward, been received at the distance of 9 rods by a sheeted and deadly fire from the whole line of the rail fence, and forced after a struggle into confusion and a precipitate retreat. The moments following this first check given by New England husbandmen to the veteran battalions of the mother country, were employed by the American officers in cheering and praising the men. Meantime Charlestown neck, over which recruits were hurrying to the action, was raked by an unceasing discharge of balls and bomb shells from the neighboring British batteries and ships; the village of Charlestown, from which so much annoyance had been experienced in the first attack, was set on fire by shells thrown from Copp's hill, and its 500 wooden edifices burst into a blaze; and while the thunder of artillery, the cracking of bomb shells, the dense volumes of flame and smoke, the crash of burning buildings, and the shouts of the combatants, made a scene than which, wrote Burgoyne, "nothing ever has or ever can be more dreadfully terrible," the British began their second attempt to storm the redoubt, firing musket shots as they ascended the hill. The Americans reserved their fire till the enemy was within 6 rods, and then a volley aimed with the fatal skill of sharpshooters did its accustomed execution. The British, however, pressed boldly forward in the face of a continuous stream of fire, but staggered before reaching the redoubt, and in spite of the remonstrances, threats, and even blows of the officers, again gave way, and retreated in greater confusion than before, leaving some of their dead within a few yards of the works. The grass fence on the left was at the same time maintained against Gen. Howe, whose division suffered severely in loss of men and officers. The crowd of spectators on the opposite shore beheld with astonishment the successful stand of raw militia against veteran regulars, and the British soldiery in Boston regarded with consternation the convoys of wounded which were brought back to the town. Gen. Clinton, who from Copp's hill had watched the action, now hurried over as a volunteer with reinforcements. The terrible scene was new to the American troops, but they answered with cheers when Prescott cried, "If we drive them back once more, they cannot rally again." It was now discovered that the ammunition was nearly exhausted, and when the engagement was renewed the Americans had each only from 1 to 4 charges of powder left, and not more than 50 bayonets in all. The British advanced in 3 divisions, from the south, east, and north-east,

and when close at hand received the same murderous volley which had never during the day been poured in upon them without making them recoil for an instant. They advanced with fixed bayonets, and the American fire immediately slackened. The last round of ammunition shot down those of the enemy who first mounted the parapet, one of whom was Major Piestra. There was for some time a hand-to-hand struggle carried on by the Americans with their bayonets, the skulls of the musketeers, the barrels after the stocks were broken off, and even with stones, till the wings of the British getting into the rear of the redoubt, at a little before 4 o'clock Prescott gave the order for retreat. He himself was one of the last to leave the redoubt, parrying with his sword bayonets which pierced his coat, and his men cut their way through the 3 divisions by whom they were nearly surrounded. They received a destructive volley as they left the redoubt, and Warren fell shot through the head with a bullet. Stark and Knowlton maintained their station at the rail fence till the troops of Prescott had left the hill, and then retired slowly, Pomeroy, a veteran of 70 years, firing back upon the enemy till his musket was shattered by a ball. The retreat was across Bunker hill, where they were encountered by Putnam, who had been collecting reinforcements, and who, amid whistling balls, sought in vain to rally them to make a stand at the unfinished works which he had constructed. The retreat was harassed by a raking fire from the British ships and batteries, but there was no pursuit beyond Charlestown neck. Putnam, who had assumed the supreme direction after the retreating forces left Bunker hill, rallied a portion of the fugitives, and encamped that night on Prospect hill. Prescott repaired to head-quarters at Cornhill, and was so little discouraged that he offered with 3 regiments to recover his post. Indeed, the result of the battle, though a defeat, had all the moral effect of a victory. The Americans had seen superior numbers of the disciplined soldiers of England retreat before their fire, and were confirmed in the trust that their liberties would be preserved. The loss of the British in killed and wounded, by the account of Gen. Gage, was at least 1,954, among whom were 79 commissioned officers wounded and 15 killed. The whole loss of the Americans was 146 killed and missing, and 394 wounded. The death of Warren, one of the most guileless and ablest of patriots, caused profound and universal sorrow.—In the centre of the grounds included within the redoubt on Breed's hill, now stands the obelisk known as Bunker hill monument. It is a square shaft, built of Quincy granite, 221 feet in height, 21 feet square at the base, and 15 at the top. Its foundations are enclosed 12 feet under ground. Inside of the shaft is a round hollow cone, 7 feet wide at the bottom, and 4½ feet at the top, and encircled by a winding stair-case of 294 stone steps which

leads to a chamber immediately under the apex, 11 feet in diameter. This chamber has 4 windows, which afford a wide view of the surrounding country, and contains 5 canons, named respectively "Hancock" and "Adams," which were used in many engagements during the war. The ceremonies of this monument was laid on the 50th anniversary of the battle, June 17, 1825, by Gen. Lafayette, then the nation's guest, when Daniel Webster, pronounced an oration to an immense concourse of people. There were present on the occasion about 500 soldiers of the revolution, and 40 survivors of the battle. The monument was completed in 1842, its entire expense having been over \$150,000; and on June 17, 1843, it was dedicated, Daniel Webster being again the orator, and the president of the United States and his whole cabinet forming a part of the vast audience.

DUNKHOOR, *Harzen*, or *Barnitz*, a fort and district in western Beloschistan. The fort is built of mud upon a large mound, apparently artificial, which the natives say was raised by an army of Ghebers. The soil is fertile, and the chief of the territory obtains from his subjects an annual revenue of about \$12,000, beside contributions of camels, sheep, wheat, &c. The military force is 800 cavalry and 2,500 infantry.

BUNSEN, **CHRISTIAN KARE JUSTUS**, chemist, a German statesman, philosopher, and theologian, born Aug. 25, 1791, at Corbach, ancient capital of the German principality of Waldeck. He began his studies at the university of Marburg, and continued them from 1809 to 1813 at Göttingen under the celebrated Heyne. In 1811 he was made a teacher at a gymnasium in Göttingen. He now gained an academic prize by a dissertation on the Athenian laws of descent, published in 1812 at Göttingen. After resigning his place, Bunsen went to Holland and to Copenhagen to study the Frisian, Scandinavian, and Icelandic languages. In 1816 he went to Berlin and became acquainted with Niebuhr, who henceforth exercised a powerful influence on Bunsen's scientific and political career. In 1816 he went to Paris and studied the oriental languages under Sylvestre de Sacy. Then he accepted the office of tutor to a young American travelling in Europe; but after waiting for a long time the arrival of his pupil at Florence, Bunsen went to Rome, where he married the daughter of a clergyman of the English church, and renewed his relations with Niebuhr, then Prussian minister there. Bunsen became Niebuhr's private secretary, which rendered him a sharer in the latter's literary labors; and in 1819 he became secretary of the legation. From this time his influence began to be felt alike in the scientific and literary world, and in the political affairs of his time. The late king of Prussia visited Rome in 1824, was pleased with the ardent but enlightened Protestant fervor of the secretary, and to this are ascribed several reforms in the state church of Prussia, which were decreed by the king dur-

ing his sojourn in the centre of the Roman world. When, in 1824, Niebuhr resigned his diplomatic position, Bunsen was made chargé d'affaires, and in 1827 minister of Prussia near the holy see. When the European powers sought to bring the affairs of Rome into order, Bunsen elaborated for the conferences the so-called *memorandum del Maggio*. He had obtained from Pope Leo XII. the celebrated brief regulating mixed marriages; but when Gregory XVI. succeeded Leo, a different view of the subject was taken at the Vatican; and then began in Germany, Poland, and all semi-Catholic and semi-Protestant countries, a series of dissensions between the state and the clergy, a contest which ended in the imprisonment of several bishops. Bunsen, being unsuccessful in his efforts to change the opinion of the pope, gave up his diplomatic position in Rome in 1837, and in 1838 became Prussian minister to the Swiss federation. In 1841 he was sent to England to take measures for the erection of a Protestant bishopric in Jerusalem, and soon after was made ambassador at the court of St. James. From England he several times visited Berlin; and in 1844, at the request of the king of Prussia, presented several memoirs and projects concerning the introduction into Prussia of a representative form of government, modelled as far as possible on the English standard. After the outbreak in 1848 Bunsen strongly favored the cause of Schleswig-Holstein against Denmark, and published a pamphlet in English, under the title, "Memoir on the Constitutional Rights of the Duchies of Schleswig and Holstein, presented to Viscount Palmerston April 8, 1848." His convictions, and the influence of his name, were on the side of the efforts made by the diet in Frankfort for the union of Germany under the king of Prussia, as emperor, and he supported this movement in several pamphlets. In 1849, in the name of Prussia, he participated in the conferences at London, and protested in 1850 against the decisions of the London protocol, which in the name of England, France, Austria, and Russia, settled the question of Schleswig, as he contended, contrary to the interests of Germany. At the beginning of the eastern war, Bunsen's sympathies were with the western allies, contrary to the will and opinion of the cabinet which he represented at London. This fact, and his opposition to the pietistic turn of the Prussian court and government, weakened the favor which for more than 20 years he had enjoyed with the king of Prussia. Toward 1853 he fell into disgrace, resigned his diplomatic functions, and retired to an active and studious private life. He established himself in the city of Heidelberg, whose university, for centuries the stronghold of Protestantism, was at the beginning of 1848 the focus of moderate liberal ideas. Bunsen holds there the position of a leader and champion of the freedom of the Christian church; opposing sternly all limitations of religious liberty, wheth-

er exercised by Roman or Lutheran, by the sacerdotal or civil powers. The most recent of his publications of this character is entitled "Signs of the Times" (Leipzig, 1856-'56, 2 vols.), which was followed by "God in History," in 1857. During this period he refused the offer of the citizens of Magdeburg to elect him to the Prussian chamber of deputies.—Bunsen's literary activity has been displayed in various intellectual fields. During his residence in Rome, in conjunction with Niebuhr, he studied Roman antiquities, and made various historical researches upon the philosophy of language and religion, and their influence in the world's history. He united the study of Plato's philosophy with Biblical and liturgical studies, and with researches in the history of Christianity. In 1826, under Champollion, who was then at Rome, he studied the Egyptian hieroglyphics. As the result of these labors we have the great work, "Egypt's Place in Universal History" (Hamburg and Göttingen, 1845-'57, 5 vols.), a book divided into 5 parts, each composing a distinct whole. Most of his other publications bear on theological and political questions. Among them "Hippolytus and his Times, or the Life and the Teaching of the Roman Church under the Emperors Commodus and Alexander Severus" (Leipzig, 1853, 2 vols.), is considered one of the most eminent productions of the present epoch in the field of theological literature. From the press of Brockhaus, of Leipzig, appeared in the early part of 1858 the first semi-volume of his "Complete Bible-work for the Christian Community" (*Vollständiges Bibelwerk für die Gemeinde*). This comprehensive work, which has engaged Chevalier Bunsen's attention for many years, will be brought out in 8 great divisions, the 1st division in 4, the 2d in 3 volumes, and the 3d division in 1, altogether in 8 volumes, which will be issued at the rate of 4 semi-volumes a year, so as to complete the entire publication in 4 years, from 1858 to 1862. The 1st division will contain the translation and exposition of the Bible, viz.: the Law, the Prophets, and other books of the Old Testament, and the books of the New Testament, with copious explanatory notes accompanying the translated text. The 2d division will be a continuation and completion of the first, under the title of "Bible Texts historically arranged and explained." The 3d division, under the titles, "Bible History," the "Everlasting Kingdom of God," "Life of Jesus," &c., will present a consideration of the great events and personages of the old and new covenants. The author states that the translation will aim at presenting a close but improved rendering of the original text, and at producing a work which shall not only prove useful to the theologians and scholars, but to the people at large.

BUNTING, a name given to several birds of the order *passeres*, tribe *corvirostræ*, family *fringillidæ*, and sub-family *emberisina*; characterized by an acute conical bill, with a straight or

nearly straight culmen, and with the lateral margin serrated; the interior of the upper mandible with a palatine hook; the wings moderate and somewhat pointed; tarsi about as long as the middle toe, and webbed; hind toe robust and longer than the tarsi; claws slender and generally curved. Among the genera are *euphonia* (P. Linn.), of which a well-known species is the black-throated bunting (*E. americana*, Gmel.), with the face part of the head greenish olive, hind head, neck, and cheeks dark ash-gray; streak over eye and lower mandible, lower neck, and middle of the breast yellow; chin white, throat black, sides gray, abdomen white, and lesser wing coverts bright chestnut; length 5½ inches; female without the black on the throat. This bird arrives in the New England states from the south about the middle of May, and returns early in September, spending the winter beyond the limits of the United States; it consumes caterpillars, insects, and immense numbers of canker-worms early in the summer; it also eats seeds of various grasses. The nest is made on the ground, and the eggs are 5, white, speckled with black. Birds of this genus are found also in Asia, Europe, and South America; they frequent bushes and open cultivated fields, seeking their food on the ground; there are about 12 species described. The genus *emberiza* (Linn.), of which familiar species are *E. hortulana*, and *E. miliaria*, contains about 30 species, scattered over the old and new world, especially the former; in the approach of winter they collect in flocks, in which they remain until spring; their habits are the same as those of the preceding genus. The genus *plochophanes* (Meyer), contains 4 species, among which are the snow-bunting (*P. nivalis*, Linn.) and the Lapland lark-bunting (*P. lapponicus*, Linn.), remarkable for their long hind toe, and very long and nearly straight claw. In winter they live in temperate Europe and North America, going to the far north in spring to breed; they associate in flocks in open mountainous districts, running quickly on the ground in search of seeds, Alpine fruits, and insects; the nest is made in fissures of rocks or on grassy hillocks. Other *fringillide*, so many species of sparrows and finches, are in various localities called buntings.

BUNTING, James, D.D., an English minister of the Wesleyan Methodist connection, born at Moryash, Derbyshire, in 1778, died in London, June 16, 1858. Both his parents were members of the Wesleyan connection, and removed to Manchester when he was a child. While in the grammar-school there he attracted the attention of Dr. Percival, who employed him as his amanuensis, and at his death made him one of his executors. While yet in his youth he became a member of the Wesleyan church; entered the travelling connection in the year 1798, and joined the conference after the death of Mr. Wesley, and was appointed to Oldham circuit. After travelling 4 years he came to the notice of Dr. Cokes, who

selected him for the missionary work, desiring to have him sent to Gibraltar. For some cause or other this design was not carried out, and he was sent to London, where he labored with much success and gained great popularity as a pulpit and platform orator. After remaining 3 years in London he was removed to Manchester, where he distinguished himself as an advocate of ecclesiastical order and discipline in a controversy with some dissipated Methodists. To this controversy he gave such evidence of a knowledge of the polity of Wesleyan Methodism as excited the admiration of the people, and secured for him the favor of the entire body in which he belonged. He was 4 times president of the Methodist conference; officiated during 17 years as missionary secretary; during 8 years as editor; since 1835, when the theological school was established, as president of that institution, and was looked upon as the acknowledged leader of the Methodists, superintending the interests of the body at home and abroad, while, at the same time, his influence was felt in other evangelized denominations, and also in the political world, statesmen frequently resorting to him for advice. Although his sphere of activity was so great, he derived only the ordinary emoluments of a Methodist minister, namely, a yearly salary of 2150, with house-rent and taxes. During all the distractions connected with the secessions that have taken place in the Wesleyan body, Dr. Bunting remained a firm, unwavering adherent and advocate of the doctrines and discipline of the church as they came from the hands of John Wesley, and to his influence and indefatigable zeal, are to be ascribed, in a large degree, the permanency and prosperity of the Wesleyan connection.

BUNTZLAU, or BUNZLAU, a town of Prussian Silesia, on the Bober. In the market place stands a monument to the Russian general Kutusoff, who died here in 1813. The town also contains an orphan asylum, schools, and several factories. Buntzian chinaware is much valued in Germany. Pop. about 6,700. The posts Opitz and Tscherning were born here.

BUNWUT, an island in the bay of Illanon, Malay archipelago, about 60 miles from Mindanao. It is surrounded by a chain of islets, coral banks, and dangerous reefs, except at one point on the E. side, where good anchorage can be obtained. It is 9 miles long, and 4½ broad. This island is in possession of a piratical chief of Selangan, and is resorted to as a rendezvous of the Illanon pirate fleets.

BUNYAN, JOHN, the author of "Pilgrim's Progress," born at Elstow, near Bedford, in 1638, died Aug. 31, 1688. His father was a tinker, and brought up his son to the same business, giving him a very imperfect education. It has been usual with the biographers of Bunyan to attribute to him an idle, vagrant, and dissolute youth, but this in a great degree is owing to Bunyan's own strain of self-condemnation. In after years, when he was made the subject of

obloquy and accused of the very vices which he had laid to his own charge, he indignantly defended himself and denied the truth of the allegations. There is no good reason to believe that his early manhood was stained with gross impurity, and a careful reading of his curious autobiography, "Grace abounding to the Chief of Sinners," will convince the student that he only adopts the extravagant style of the Puritans. He acknowledges a habit of profane swearing, but says that he was cured of this by a single well-timed rebuke. He appears to have been very fond of playing at tip-cat, and dancing on the village green, as well as ringing the church bells. All these amusements he in time came to look upon as sinful, and bemoaned as if he had committed irreparable evil. At the age of 17 he enlisted in the parliamentary army, but all that is known of this part of his career is, that he was present at the siege of Leicester, and escaped death by permitting a fellow-soldier to take his place as a sentinel, and thereby lose his life. Bunyan always regarded this as a direct interposition of Providence. His military experience was eventually reproduced in his writings, especially in his "Holy War," written after the completion of the "Pilgrim's Progress." Soon after the campaign of 1645 he returned home and married one as poor as himself. He now partook of that religious enthusiasm which was spreading all over the land; and he became distressed by doubts regarding the safety of his soul, and suffered all the horrors experienced by those who imagine themselves forever shut out from the mercy of God, and given up to the powers of hell. During the year which he assigns as the period of his greatest terrors, his sufferings were extreme. Now he would imagine that only the Jews could be saved, and again that the Turks and not the Christians were true believers. At last his mind became more quiet, his soul was gradually comforted, and he began to preach to the poor people of Bedford. He had been 5 years engaged in this occupation, when the restoration placed power in the hands of the cavaliers, and in common with many he was imprisoned. In Bedford gaol, the place of his incarceration, he remained upward of 12 years. His faith was put to the trial many times, as he was constantly told that if he would give up preaching he should at once be set at liberty, yet he always answered: "If you let me go to-day, I will preach again to-morrow." Nothing could shake his resolution, neither sneers, nor threats, nor his own health, nor the condition of his family suffering from poverty. Not being able to work at his old trade of a tinker, he made tagged laces to support himself, wife, and children, one of whom had been blind from her birth. These laces were furnished to peddlers, and while employed in this mechanical way, he neglected no opportunity of preaching to the prisoners. He had a most intimate knowledge of the Bible, which, with Fox's "Book of Martyrs," was a constant companion, and such hours as he could

devote to composition, were now spent in religious writing, many of his papers being against the Quakers, whom he cordially disliked. The misery of his family, and his own courage, at last prevailed with those in power; the rigor of his confinement was relaxed, and in 1671 he was freed altogether. In 1678 he published the 1st part of his "Pilgrim's Progress," only one perfect copy of which is known. To the corrector of the press he is indebted for a little improvement in the syntax and spelling, but not a single scene or line of that immortal work was suggested to him by others. When he had entirely completed the 1st part, he showed it to some of his friends, and was generally annoyed by their criticisms, they being divided in sentiment whether it should appear or not; but he finally wisely decided to publish it. At first it reached but a small class of the community, although hailed by them with delight; but in the same year a 2d edition was published with great success. From 10 to 15 editions were issued during the author's life, and he had the satisfaction of knowing that his work was read and re-read by hundreds of thousands in England, Scotland, among the Protestants of Holland, the Huguenots of France, and the settlers of New England. In 1684 he published the 2d part of it, and soon afterward his "Holy War," now little read. He continued to preach without further molestation, and every year made a journey to London, where he drew together at all times a large concourse to listen to his sermons. In the summer of 1688 he took cold from riding in a heavy rain after a benevolent visit to reconcile an angry father to his son. He died at his lodgings in Snowhill, and was buried in the grave-yard of Bunhill-fields, London. His great fame rests upon his "Pilgrim's Progress." Of this the editions have been almost innumerable, as well as its imitations. Yet fascinating as it is to the young and old, learned and unlearned alike, for full 100 years it was cherished by the lowly and obscure before its merits were appreciated by the great. No estimate can be formed of the good it has accomplished, or the number of pilgrims its examples have cheered and sustained in their journey through life. The story of Christian, his despair and struggles, his escape from his neighbors Pliable and Obstinate, his contempt for the counsels of Mr. Worldly Wiseman, who dwelt in the town of Carnal Policy and went to church in Morality, his meetings at the wicket-gate and the house Beautiful, his dreadful fight with Apollyon, his passage through the valley of the Shadow of Death, and, in truth, the whole of his triumphant pilgrimage, will ever charm the reader, from one gifted with the world-wide genius of Bacon, to the humblest rustic, "never heard of half a mile from home."—ROBERT, the last male lineal descendant of John Bunyan, born in 1775, died at Lincoln, England, Nov. 27, 1855.

BUOL-SCHAUENSTEIN, KARL FERDINAND, count, an Austrian statesman, born May 17, 1797, has been successively ambassador at Stutt-

gari, Turin, and in 1843, for a short time, at St. Petersburg. Subsequently he was selected, with Baron Meyendorff, to aid Prince Schwarzenberg in the conference at Olmitz, and at a later period he attended those of Dresden. In 1851 he resided as ambassador in London, where he succeeded in smoothing the difficulties which had arisen between the English and Austrian governments, on the subject of Lombardy. After the death of Prince Schwarzenberg he was appointed, April 11, 1852, to succeed him as president of the Austrian cabinet, and as minister of foreign affairs; positions which he continued to hold. In 1855 he presided at Vienna over the conference of Russia and the allied powers, and in 1856 attended the congress of Paris, where he signed, on behalf of Austria, the general treaty of peace of March 30, and on April 15, a separate treaty concerning Austria alone. In the complications of Austria with Switzerland and Sardinia, and on various other occasions, Count Badiuzzi exhibited great good sense and moderation.

BUONALENTI, BERNARDO, an Italian artist, born at Florence in 1555, died in 1608. He invented several hydraulic machines, and the invention of hand-grenades has also been attributed to him. He improved the scenic decorations of the theatres, and invented machines for changing them.

BUONAROTTI, PIZZO, descended from an Italian family, born in Pisa, Nov. 11, 1761, died in Paris, Sept. 15, 1837. He received an excellent education under the auspices of the grand duke Leopold, but forfeiting the friendship of that prince, on account of his sympathies with the French revolutionists, he resorted to Corsica, where he commenced a journal of an inflammatory character, that he became involved in difficulties with the government. After having spent some time in Sardinia, where he was invited to draw up a liberal constitution for the people, he eventually repaired to Paris to urge the desire of the people of the Corsican island of St. Pierre, for annexation to France. French citizenship was conferred upon him; he was employed in important missions in Corsica and Oneglia, and became an ardent partisan of the Ferrerists. Having been detained for some time in prison after the fall of Robespierre, he founded the Pantheon association, and when this was dissolved by the government, he joined the conspiracy of Babeuf, was sentenced to transportation, but was finally permitted to retire to Geneva, and afterward went to Brussels, where he published, in 1828, his *Conspiration de Babeuf*. Returning to Paris after the revolution of 1830, he spent the rest of his life in poverty and obscurity.

BUONAROTTI, MICHEL ANGELO, an Italian poet, nephew to the great Michel Angelo, born at Florence in 1565, died Jan. 11, 1648. He was received into the academy of his native town at the age of 17. He was afterward admitted into the academy della *Crozza*, and took part in editing its great dic-

tionary. He edited the poems of his uncle, and composed 2 comedies, *La Fiera* and *La Tascia*, the former of which is divided into 5 days, with 6 acts to each day.

BUONINSEGNA, DECCO, an old Italian painter who flourished at Siena from about 1350 to 1415. His principal work was an altar-piece for the cathedral of Siena.

BUONONCONI, GIOVANNI BATTISTA, an Italian composer, born in 1658, at Modena, died during the 18th century. In 1697 he went to Vienna, and soon after to Berlin, where his opera *Pollione* had great success. After living a while at Rome, he went, in 1720, to London, and became there one of the most powerful rivals of Handel. Every thing in England, at that time, was made to bear upon party politics, and Buononconi became the favorite of the whigs, while Handel was supported by the Tories. But upon a trial of skill, in an opera of their joint composition, the talent and taste of Buononconi proved an unequal match for the genius of his rival.

BUOYS, floating objects formed of cork, wood, hollow plate iron, &c., usually hollow like a cask, and strongly hooped, which are moored on the water so as to rise and fall with the tide. They are either to mark a shoal, and so to enable vessels to navigate a channel in safety, or in rivers and harbors they are laid down for the purpose of enabling vessels to make fast, instead of letting go their anchors. Buoys are used also to point out the place at which an anchor or a cable has been let go near the shore.—Bell buoys, recently introduced, are floating platforms of plate iron, with a mast supporting a bell, and a rail around the platform to give security to persons taking refuge upon them.

BUPALUS, an ancient Greek sculptor, of a family long celebrated as statuaries, flourished at Olios about 500 B. C. He and his brother Athenis are best known for their satirical conflict with the poet Hippocritus. Augustus adorned many of the Roman temples with works of the 2 brothers, who used the pure white marble of Paros. Pausanias represents Bupalus as being an elegant architect as well as a sculptor.

BUPHONIA (Gr. *Buphonia*, ox-killer), an ancient Athenian festival, celebrated every year on the 14th of Scirophocion, on the Acropolis, in honor of Zeus. Barley and wheat were placed on the altar, and the ox destined for the sacrifice was permitted to go and eat the seeds, when a priest armed with an axe sprang forward and slew the ox, and then secreted himself. The other priests, as if not knowing the author of the deed, made inquiry, and failing to ascertain any thing, for lack of a better victim arraigned the axe, found it guilty, and condemned it. The Buphonia were also called *Dipolia*.

BURBAGE, THOMAS, an associate of Shakespeare, and actor of his tragic parts, died March, 1620. Of his abilities there is little notice, except from one or two contemporary authors

by whom his name is incidentally mentioned. A contemporary epitaph, in which he is much praised, is extant. In 1608 he was one of the actors to whom, in company with William Shakespeare, a license was granted by James I.

BURBECK, HENRY, an officer in the American revolution, born in Boston, June 8, 1754, died at New London, Conn., Oct. 2, 1848. He joined the American army at the breaking out of the war, and received a commission as lieutenant. In 1777 he was made captain in a regiment of artillery in the Massachusetts line. He was with the army at Cambridge, was employed near New York till the British evacuated that city, was in the army of Pennsylvania under Washington, and shared in the conflicts of Brandywine and Germantown, in the winter's sufferings at Valley Forge, in the perilous retreat through New Jersey, and in the battle of Monmouth. He retired at the close of the war with the brevet rank of major. Subsequently he engaged under Gen. Wayne in the Indian wars on the western frontier, and for 4 years held command of Fort Mackinaw. In the war of 1812 with Great Britain, he held the rank of brevet brigadier-general.

BURKHARDT, JOHANN KARL, a German astronomer, born at Leipsic, April 30, 1773, died in Paris, June 21, 1825. He was educated in practical astronomy under Zach at Gotha, by whom he was recommended in 1797 to Lalande at Paris, where he was appointed in 1799 adjunct professor in the bureau of longitudes, and after the death of Lalande, in 1807, became director of the observatory of the military school. He distinguished himself by his calculations of the orbits of comets, translated into German the first 2 volumes of the *Mécanique céleste* of Laplace, published many astronomical tables, and wrote valuable memoirs for the academy of sciences.

BURKHARDT, JOHANN LUDWIG, a Swiss traveller, born at Lausanne, Nov. 24, 1784, died in Cairo, Oct. 17, 1817. He was descended from a patrician family of Basel, and after studying at Leipsic and Göttingen, went to England in July, 1806, where he formed the acquaintance of Sir Joseph Banks, and embraced the plan which the latter suggested of exploring the interior of Africa. He passed the next 2 or 3 years in gaining a knowledge of the Arabic language, and on March 2, 1809, sailed for the Mediterranean, arriving at Malta in April, and there assumed the disguise of a Mohammedan merchant. Thence he sailed for Syria, and on arriving on its coast joined a caravan and forthwith proceeded to Aleppo, where he made a protracted stay, engaged with his Arabic studies, and in gaining such a knowledge of the eastern character and customs, that afterward in times of trial and danger, when he was suspected of being a spy, he was enabled to pass not only as a true but as a learned Mussulman. In July, 1810, he left Aleppo on a journey to Palmyra, thence through the country of the Hauran to Damascus. He visited the famous ruins, but was pre-

vented from at once going to the Hauran by the treachery of the Arabs, although he remained 6 weeks in Damascus, and went to Lebanon, the territory of the Druses, Mount Hermon, and other places in Syria. He then in a fatiguing journey of 26 days explored this obscure country of the Hauran, the Huranitis of the Romans, finding many vestiges of ancient cities and Greek inscriptions, some of which dated as far back as the reign of Trajan and Marcus Aurelius. In Jan. 1811, he undertook excursions into the desert toward the Euphrates, and on one of these occasions was robbed, stripped to the skin, and failed in accomplishing any of the objects of his journey. In Feb. he again repaired to Damascus, made another journey into the Hauran, transmitted an account of his discoveries there to England, and on June 18 departed for the Dead sea. He explored its eastern shores, visiting many places celebrated in the Old Testament, and afterward the ruins of the city of Petra, which had not been visited by any modern European before himself. Proceeding toward Akaba, he joined a small caravan, crossed the desert of El Jih, and passing a short distance to the north of Suez, journeyed on to Cairo. His first employment at Cairo was to draw up a detailed account of his journey through Arabia Petræa; and then he turned his attention to an exploration of the interior of Africa. Finding no opportunity, he made a journey into Nubia, visiting the principal ruins of the Nile; he visited and described the majestic temple of Aboo Sambool, which was afterward opened by Belzoni. On March 2, 1814, he joined at Esneh a caravan of about 50 slave merchants, and after suffering innumerable trials and privations, he arrived on June 26 at Suakin on the Red sea, where he took passage for Jiddah, landing there on July 18. His funds becoming exhausted, he determined to make a direct application to Mehemet Ali, then at Jayef, to learn whether he would accept a bill upon Burckhardt's correspondent at Cairo, and order his treasurer at Jiddah to pay it. This application was made through the pasha's Armenian physician, and before the result could be known to Burckhardt, Mehemet Ali, accidentally hearing of his condition, despatched a messenger to him with a sum of money, requesting him to repair at Tayef. Burckhardt at once obeyed the command, and on being presented to Mehemet Ali, Burckhardt clearly perceived that he was regarded by him as a spy of the English government, although he was well received by the pasha, and eventually obtained his permission to visit Mecca during the last days of the month of Ramadan. Accordingly, on Sept. 7, he departed with other pilgrims for the holy city, and arrived at Mecca 2 days afterward. Thence he went to Jiddah to complete the purchase of his travelling equipments, and returned to Mecca about the middle of October. After witnessing the gorgeous pageant and the religious services of the great pilgrimage of Arafat, he visited Medina, and

barely escaping from the plague which was raging at Yembo, he finally returned to Cairo, June 24, 1816. He then undertook a journey into lower Egypt, and afterward wrote the journal of his Nubian and Arabian travels. In 1816, the plague again broke out at Cairo, and to avoid it he made a journey to Mount Sinai. He was about to join a caravan for Fezzan, when he died of dysentery. He bequeathed his collection of 206 volumes of oriental MSS. to the library of the university of Cambridge, and his travels were published after his death in England and Germany.

BURDEN, HESER, an inventor and mechanic, born at Dunblane, Scotland, April 20, 1791. His father was a small farmer, and it was while a youth engaged on the farm that the son gave evidence of inventive genius, by making with his own hands labor-saving machinery from the roughest materials, with but few tools and no models. His first marked success was in constructing a thrashing machine. He afterward engaged in erecting grist mills and making various farm implements. During this period he attended the school of William Hawley, an accomplished arithmetician; and afterward, having resolved to try his fortunes in America as a machinist and inventor, he went to Edinburgh and entered upon a course of studies, embracing mathematics, engineering, and drawing. Arriving in this country in 1819, he devoted himself to the improvement of agricultural implements. His first effort was in making an improved plough, which took the first premium at 3 county fairs. In 1820 he invented the first cultivator in the country. In 1823 he was appointed agent of the Troy iron and nail factory. In 1825 he received a patent for his machine for making the wrought spike. In 1834 he obtained a patent for an improvement in his spike machine, and in 1835 for a machine for making horse-shoes. In 1840 he patented a machine for making the hook-headed spike, an article which is used on every railroad in the U. S. In the same year he patented a self-acting machine for reducing puddlers' balls into blooms. In 1843 he patented an improvement in his horse-shoe machinery. In 1849 he patented a self-acting machine for rolling puddlers' balls into bars. In June, 1857, he patented a new machine for making horse-shoes. This may be considered his greatest triumph in mechanics; it is self-acting, and produces from the iron bars 60 shoes per minute. He has obtained patents for this machine from every prominent government of Europe. Mr. B.'s suspension water-wheel is another of his inventions. In 1823 he built a steamboat 800 feet long, with paddle-wheels 30 feet diameter; from its shape it was called the "cigar boat." It was lost through the mismanagement of the pilot. In 1838 Mr. B. warmly advocated the construction of a line of ocean steamers of 15,000 tons burden. In 1845, when the steamer Great Britain was crippled by breaking one of her screw blades, Mr. B. went to England for the special

purpose of inducing her owners to adopt the blades, but was unsuccessful. His views in regard to ocean navigation becoming known to some gentlemen in Glasgow, they, with his permission, issued a prospectus for "Burden's Atlantic Steam Ferry Company," in which was advocated the establishment of a line of steamers of enormous size, thus anticipating by several years the "Leviathan" of Mr. Brunel.

BURDER, RAY, GROOM, an English clergyman of the Independent church, and one of the founders of the London missionary society, born June 5, 1759, died May 29, 1832. In 1779 he was admitted a student in the royal academy of arts. He began then to preach occasionally, and at length determined to abandon artistic pursuits altogether. He was settled as pastor first at Lancaster, and in 1783 he removed to Coventry, where he resided during 20 years. In 1803 he became pastor of the church in Fetter lane, London, where he officiated during the remaining 29 years of his life. He was secretary of the London missionary society, and editor of its organ, the "Evangelical Magazine." He is now remembered principally by his "Village Sermons," which appeared in 6 volumes from the years 1789 to 1812. He also published volumes of "Cottage Sermons," "Sea Sermons," and "Sermons to the Aged," which were very widely circulated; and edited the "Pilgrim's Progress," and Henry's "Commentaries upon the Bible."

BURDETT, SIR FRANCIS, an English politician, born Jan. 25, 1770, died Jan. 26, 1864. He was educated at Westminster school and Oxford, and afterward passed some years on the continent, residing at Paris during the early part of the French revolution, and returning to England, in 1796, imbued with some of its principles, in which he was encouraged by his friend and instructor, John Horne Tooke. He married Sophia, youngest daughter of Thomas Coutts, the wealthy London banker, and sister to the marchioness of Bute and the countess of Galloway. In 1796 he became parliamentary representative of Boroughbridge, in Yorkshire, his colleague being Sir John Scott, afterward Lord Eldon. In parliament he avowed the most liberal opinions, denouncing the government as inimical to the liberties of the people, and condemning the war with France. He strenuously advocated parliamentary reform, the liberty of the press, and inquiry into and exposure of the abuses in the Cold Bath Fields and other prisons. He was brought forward at the general election of 1802 as candidate on the popular interest for Middlesex, was elected after a long and close contest, had to vacate his seat, owing to some irregularity in the proceedings, stood a second contest in 1804, and was finally returned. He continued strongly in opposition to the government until the accession of Fox and Lord Grenville in 1806, when he as strongly supported their policy, but at the same time lost his seat for Middlesex at the general election. In 1807 he was put forward as candidate for the city of Westminster while suffering from a

wound received in a duel with Mr. Paul (who was also wounded and also went to the poll), and was elected with Lord Cochrane. He continued to sit for Westminster for the next 30 years. In 1809 he made strong, not to say violent, speeches in the house of commons in advocacy of parliamentary reform. Early in 1810 he presented, and forcibly supported, a petition from his constituents in favor of the same measure. In Feb. of that year John Gale Jones, a popular declaimer at reform meetings in London, having impugned the conduct and motives of the house of commons, was committed to Newgate by that assembly. Immediately afterward Sir Francis Burdett addressed a letter to his own constituents, in which he denied the power of the house of commons to imprison delinquents, and condemned their treatment of Gale Jones. This letter was published in Cobbett's "Political Register" on March 24, 1810, and after a warm debate (April 6) the house of commons voted it to be "a libellous and scandalous paper," and the apprehension of the writer was ordered. Maintaining that the speaker's warrant was illegal, he barricaded his house and was besieged for 3 days, when the sergeant-at-arms, assisted by police and military, forcibly entered and conveyed Sir Francis to the tower. Prior to this, riots had commenced in the neighborhood of his house, and the military had fired upon and wounded many of the people. On the return of the soldiers from escorting Sir Francis to the tower, the mob assailed them; the soldiers fired their carbines, and shot one man dead, beside wounding several others. Sir Francis remained in the tower, however, until the prorogation of parliament in June, 1810, when his imprisonment expired as a matter of course. He afterward brought actions against the speaker for having ordered his arrest with forcible entry into his house, against the sergeant-at-arms for having executed the speaker's warrant, and against the lieutenant of the tower for holding him in custody, but was unsuccessful. In succeeding sessions he contended that taxation without representation was a fraud on the public. He also opposed the suspension of the *habeas corpus* act, and supported Catholic emancipation. In 1819 he was prosecuted by the attorney-general for a letter condemning the proceedings of the Lancashire magistrates and yeomanry at the "Manchester massacre," and in March, 1820, a Leicestershire jury declared this missive to be a seditious libel. His sentence was 3 months' imprisonment and a fine of £1,000. The bank note which he thus paid away is still preserved in the bank of England, with an inscription in Burdett's own writing that to save his life, which further imprisonment threatened to destroy, he submitted to be robbed. He supported the cause of Queen Caroline; brought in, and carried through the commons, a Catholic emancipation bill; supported chancery reform; opposed the corn laws; steadily adhered to Mr. Canning during his brief premiership, in 1827;

aided Peel and Wellington in passing the Catholic relief bill of 1829; and strenuously supported Lord Grey in the reform bill and the abolition of slavery. Aristocratic by birth, rank, property, and connections, he became angry with Lord Melbourne for maintaining a compact, expressed or implied, with Mr. O'Connell, and even made a motion in Brookes's club for Melbourne's expulsion. His Westminster constituents, after 30 years' reliance upon him, sent him a requisition to resign his seat in parliament. He complied, again became a candidate (though with an avowed change in his politics), and, between distrust in Lord Melbourne and abiding popularity on personal grounds, was reelected, after a close contest. He made a tour through the north of England in the course of that year (1837), avowing decided tory opinions. At the next election he was returned as member for North Wiltshire, where he had large estates, and held that seat until his death. At one period of his life Sir Francis Burdett lent £1,000 to Mr. Cobbett, which sum was never repaid, Cobbett declaring (in a letter from Long Island in Nov. 1817) that principle forbade his paying money to any English subject, as he had been badly used by the English government.—In person Burdett was thin, and almost invariably wore the costume (buckskins and top boots) of an English fox hunter. The best portrait of him was given by Hayter in his "Passing of the Reform Bill." He was a fluent and earnest, rather than an eloquent speaker, and was fond of quotations from the classics. Parliamentary reform was the great purpose of his life, and when that was granted, in 1832, he considered all beyond that as advancing into revolution. Napoleon stated at St. Helena that if he had carried out his intention of invading England, it was his purpose, had he succeeded, to proclaim a republic in London and establish Sir Francis Burdett, as a popular idol, at its head. On the death of Mrs. Coutts (duchess of St. Albans), his daughter, Angela Georgiana, born April 25, 1814, inherited her vast property, assumed the name of her benefactor, and, as Miss Burdett Coutts, became equally distinguished for her wealth and the liberal use of it.

BURDON, WILLIAM, an English writer on philosophical subjects. His work, entitled "Materials for Thinking," supplied Colton with many of the materials of his "Lacon." He also published "Thoughts on Politics, Morality, and Literature." He died in 1818.

BURDWAN, a district of British India, enclosed by the districts of Beerbhoom, Nuddea, Hoogly, and Bancora; area, 2,224 sq. m.; pop. 1,854,152. It is a rich, level country, abundantly watered by the Hadjee, Dummodah, Bhagruttee, &c., but subject to inundations. The climate is sultry but healthy. The lands are highly cultivated, and produce sugar, indigo, tobacco, cotton, rice, potatoes, betel, &c. Sugar refining is extensively and skilfully carried on. Coal and iron are found in considerable quantity and exported to Calcutta, but a large part of these

products, though bearing the name of Burdwan, is really brought from the adjacent district of Rancoot. The other exports are hides, horns, Gunter, tea, and silk. The native landowners, or *zamindars*, are usually very rich, and many of them reside at Calcutta, leaving the management of their estates to agents. The chief of these proprietors is the present titular rajah, a part of whose immense wealth has been devoted to the advancement of education. A school in Burdwan, the extension of a branch of the medical college, and several scholarships in the Hindu college, owe their foundation to his liberality. The great military route, denominated the great trunk road from Calcutta to Benares and the North-West Provinces, passes through this district, which is also intersected by the unfinished railway from Calcutta to Rajmahal, and by the branch railway from Hardwan to the coal mines of Rancoogunja. Burdwan was formerly an independent state, and was acquired by the E. I. company under the treaty with Meer Cassim in 1764. The cession was confirmed by the emperor Shah Alum in 1765.—**BURDWAN**, the capital of this district, is situated on the left bank of the Damoodah, 74 miles N. W. of Calcutta; pop. 64,000. It consists mainly of a crowded assemblage of wretched mud houses, with no temples of much elegance, and few handsome buildings of any sort. The residence of the titular rajah is a collection of various-colored houses surrounded by gardens, and remarkable for size and want of symmetry. The town contains English government and military schools, the residences of the European civil functionaries, and factories of silk and cotton. In the vicinity are indigo works, and an artificial pool surrounded by an ornamented portico, much resorted to by bathers.

BUREAU, a county of Illinois, N. W. of Illinois river, which is here navigated by steamboats. The surface is but little elevated, and the soil is generally fertile. Timber is scarce. Small groves are scattered over the surface, but there are no forests of considerable magnitude. Indian corn, wheat, oats, hay, and dairy produce, are the staples. In 1850 the productions were 542,822 bushels of Indian corn, 171,403 of wheat, 110,945 of oats, 3,425 tons of hay, and 151,410 pounds of butter. There were 6 corn and flour mills, 2 newspaper offices, 13 churches, and 1,478 pupils attending public schools. Area, 890 sq. m.; pop. in 1850, 19,518, an increase since 1850 of 10,877; capital, Princeton. The Chicago and Rock Island, and the Chicago, Burlington, and Quincy railroads intersect the county.

BURET, EUGENE, a French writer, born at Troyes in 1811, died at Saint-Lau Taverny in 1842. In 1840 he wrote a dissertation on pauperism, upon which a prize was conferred by the academy, and subsequently published in England with important paper upon the misery of the laboring classes in France and England. He spent some time in Algiers, and wrote a valuable volume upon that country.

BURETTE, a chemical instrument used for dividing a given quantity of any liquid into 100 or 1,000 parts.

BURG, JOHANN THOMAS, a German astronomer, born at Vienna Dec. 24, 1766, died at Wismar, near Klagenfurth, Nov. 22, 1834. He was for 4 years assistant in the observatory at Vienna, and afterward professor at Klagenfurth. In 1798 the French institute proposed an astronomical question, and required that its solution should be based upon at least 500 observations. Papers of great merit were presented by Burg and by Alexis Bouvard, and the judges were at a loss between claims so nearly equal. The difficulty was settled by Neapoleon, who contributed the amount of 3,000 francs for a second prize. The most important publications of Burg were upon the subject of the lunar motions.

BURGDORF (Fr. *Berthoud*), a town of Switzerland, on the Rhone. It is the outlet for the iron goods and chains of the Emmenthal. The castle which stands here was formerly a place of great strength. Postolazzi resided from 1705 to 1804 in the chateau of Burgdorf, and converted it into an educational institution. In the vicinity are the baths of Saumachans. Pop. 3,709.

BURGER, FURZMAN, baron, Austrian governor of Lombardy, began life as a lawyer in Gratz, and having subsequently rendered signal services to the Lloyd's steamboat company of Trieste, he was sent in 1845 as delegate of that city to the Frankfurt parliament. He soon relinquished his seat, and, returning to Austria, was appointed attorney-general at Trieste, and in 1850 governor of Styria. Successfully overcoming the prejudices attaching to him as a commoner, and adopting the policy of his friend Bach, the minister, he gave much satisfaction to the government, and was promoted in 1851 to the office of governor of Lombardy, the title of baron being conferred upon him April 23, 1864.

BURGER, JOHANN, a German writer upon rural economy, born Aug. 5, 1773, at Wolfen-berg, in Carinthia, died Jan. 24, 1842. He introduced the culture of maize, and the use of improved agricultural implements, among which was the horse-hoe or cultivator. In 1808 he was appointed professor of agriculture in the lyceum at Klagenfurth, where he remained for 12 years. His most important work was a "Hand-book of Agriculture," published in 1830.

BURGER, GOTTFRIED AROVER, a German poet, born at Wellmerswende, near Halberstadt, Jan. 1, 1748, died in Göttingen, June 8, 1794. Educated by his father, a Protestant minister, he evinced a remarkable talent for poetry. He left the school of Aschersleben in consequence of a severe punishment, incurred on account of a comic poem, and that of Halle because theological studies did not agree with his romantic disposition. He now chose the law, and went to Göttingen, where he found a circle of congenial spirits, the 2 counts of Stolberg, Voss, Holty,

and others, with whom he formed the romantic *Hainbund*, and pursued the study of foreign poetry, both ancient and modern. There he wrote his popular ballad *Lenore*, which made him one of the favorites of the German nation. In 1772 he obtained a small office, and his grandfather now assisted him with money; but a part of this was embezzled, and a series of bitter embarrassments followed. Love and marriage, however, were the chief sources of grief and sufferings for the poet. Three times married, his conjugal life was destroyed by romantic passion, death, and divorce. Appointed at Göttingen as professor without salary, he labored by writing and translating to earn bread for his children, and even the consolations of poetry and fame were envenomed by the severe criticism of Schiller. Death, however, soon gave him rest. His poetical works are distinguished by genial force and melodious versification. They bear the stamp of an ardent and passionate, but honest soul. Schiller found them wanting in the ideal element. His *Lenore*, *Lied vom bravem Manne*, &c., rank among the best productions of their kind. Renowned authors of other countries, among others Walter Scott and the great Polish poet Mickiewicz, in his beautiful *Uciezka*, have imitated him.—His first wife died in 1784. Bürger married then her sister Molly, who had been long before the object of his devoted love, and whom he celebrated with poetical enthusiasm in his writings. Molly died in 1786.—ELISE BURGES (Maria Christine Elizabeth Hahn), the poet's third wife, born in Stuttgart, Nov. 19, 1769, died in Frankfort-on-the-Main, Nov. 24, 1838. Fascinated with Bürger's genius, she addressed a poem to him expressive of her love and admiration. They were married in 1790, but divorced 2 years afterward. Elise was as brilliant as she was sentimental, became in turns actress and improvisatrice, and wrote several dramas, a novel, and a volume of poetry.

BURGES, TRISTAM, an American statesman and orator, born in Rochester, Mass., Feb. 26, 1770, died in Providence, R. I., Oct. 13, 1858. His father, John Burges, entered the army as a lieutenant in 1775, with the intension of remaining in it during the war, but a severe illness, from which he never fully recovered, obliged him to resign in a few months. He was a farmer of moderate means, and in winter worked at his trade as a cooper. With a large family of 8 sons and 5 daughters, and at a period when schools, even in New England, were few, he was unable to give his children the advantages of an early education. Tristam, the youngest of the sons, was obliged to assist his father on the farm and in the cooper's shop. His eldest sister taught him to read, his father instructed him in writing and arithmetic, and from a friendly sea-captain he learned a little navigation. When 15 years old he attended a school in the vicinity for 6 weeks, and again the next year for 6 weeks more. This was all the instruction he received from others until

he reached the age of 21. But he was a great reader, perusing every book within his reach, and devoting his leisure hours to composition and other modes of self-improvement. At 21 he commenced the study of medicine, and entered the academy at Wrentham, Mass., to prepare for college. A severe illness soon obliged him to leave this situation, but his determination to acquire a liberal education could not be repressed. He returned to the academy in the autumn, and was again called home by the death of his father. With rigid economy, and by teaching school a few months in the winter, he was enabled to return to Wrentham in the spring of 1792. Here his fine oratorical powers were first cultivated by a course of self-discipline not unlike that which the great master of Grecian eloquence employed to remedy a defect of nature. Although very fluent in conversation, yet whenever he rose to speak at the school exercises he would stammer and hesitate to such a degree that his friends deemed it impossible for him ever to acquire the power of oratory. But his energy and ambition were unconquerable. Near the village was a dense forest, within which he found a small cleared space, where, in solitude, he daily practised declamation, carefully studying every tone and movement, until he had mastered his hesitation, and acquired a natural and easy style of delivery. In Sept. 1798, he entered Rhode Island college, now Brown university, at Providence, and graduated 3 years later with the first honors of his class. He then taught a school in Providence for more than a year, at the same time pursuing the study of law, and was admitted to practise in 1799. The bar of Rhode Island at that time was eminent for the eloquence and legal ability of its members. It was a trying field for the young advocate, and a fitting arena for the exercise of his noblest powers. He soon won the distinction which legal acumen and commanding eloquence cannot fail to confer. His practice became extensive. The power of his oratory and the clearness of his arguments were confessed by all who heard him. In 1801 he married a daughter of Welcome Arnold, an opulent merchant of Providence. Mr. Burges soon became a leader of the federal party, and in 1811 was elected to a seat in the state legislature. In 1815 he was made chief justice of the state. The triumph of the republican party the next year removed him from this important trust. He was shortly afterward made professor of oratory and belles-lettres in Brown university, which place he filled with great success until his election as a representative in congress in 1825. He took his seat in December of that year, and almost immediately achieved a national reputation by his splendid speech on the judiciary, which was pronounced by a veteran member of the house to be "one of the greatest displays of eloquence ever heard in this hall." In 1827 he was re-elected without opposition. As chairman of the committee on military pensions he made a

report and submitted a bill proposing a system of pensions for the surviving soldiers of the revolution, and including also the widows of those who had died before this national debt of gratitude was acknowledged. The woolen bill in 1828 initiated a series of debates upon the tariff, which lasted for 5 years. It was in the course of this protracted controversy that Mr. Burges made many of his most brilliant efforts in defence of the American system; and it was in repelling the attacks made upon him by the opponents of protection that his luminous logic and his terrible sarcasm won for him an unrivalled reputation as a perfect master of the great art of intellectual gladiatorialship. There was scarcely a question of any importance that arose during the 10 years of his congressional career, which Mr. Burges did not illustrate with his convincing logic, his persuasive eloquence, or his blighting satire. In 1832 he was again elected, for the 5th and last time, at a period when the doctrine of nullification was agitating the country. His views on this subject were fully and fearlessly expressed. It was the only point upon which he sustained the course of President Jackson. He opposed the compromise tariff bill of Mr. Clay, when it came down to the house, with a vehemence natural to his character. This opposition,决然ness, caused his defeat in 1835, when the democratic republican party obtained the power in Rhode Island. He never again took part in public affairs, but cultivated his farm near Providence until his death, which occurred in the 54th year of his age. In the style of his writings and speeches Mr. Burges was ornate and peculiar. The richness of his classical and scriptural illustration was beyond that of his contemporaries. The sentences of his logic were felt and admitted by his opponents. He is better remembered for his unequalled sarcasm, probably because that was a sphere in which he had many competitors, and wherein he was usually the victor. But the brilliancy of his scholarship, the beauty of his allusions, the exquisite ornamentation of his more finished efforts, those are points that give him a far higher title to remembrance than the deadly thrusts of a satire in which he had no equal.—A memoir of Tristram Burges, with selections from his speeches and occasional writings, by Henry L. Bowen, was published in 1895.

BURGESS, GEORGE, D. D., bishop of the Protestant Episcopal church in the state of Maine, born in Providence, R. I., Oct. 31, 1809. After graduating at Brown university, and holding a teachership in that college, he travelled in Europe, and studied for 2 years in the universities of Göttingen, Bonn, and Berlin. He was rector of Christ church in Hartford from 1834 to 1847, when he was consecrated bishop of the diocese of Maine, and became, at the same time, rector of Christ church in Gardiner. The duties of both offices he has since fulfilled with great acceptness and ability. He has published 2 academic poems, a metrical version

of a portion of the Psalms, "Pages from the Ecclesiastical History of New England," a curious treatise on death, entitled the "Last Enemy, Conspiring and Conquered," a volume of "Sermons on the Christian life," and a valuable discourse delivered in 1854 before the Maine historical society. His style is remarkable for its sterling and sober vigor.

BURGESS, THOMAS, bishop of Salisbury, Eng., born at Odibank, in Hampshire, Nov. 13, 1759, died in Salisbury, Feb. 19, 1837. His father carried on business as a grocer, and his brother removing to London, where he had an establishment in the Strand, long the depot of "Burgess's sauce," amassed a large fortune there. Thomas Burgess was educated at Winchester, obtained a scholarship at Oxford at the age of 20, and became logic reader and fellow and tutor of his college. He obtained a prize for an "Essay on the Study of Antiquities," and published a "Treatise on the Origin and Formation of the Greek Language." Mr. Addington, who had been his fellow student at Winchester and Oxford, became prime minister in 1801, and appointed him bishop of St. David's in 1808. He was translated to the much richer see of Salisbury in 1835, which he retained until his death. He was mainly instrumental in founding the royal society of literatare, of which, in 1821, he became first president, an office which he resigned to Lord Dufferin in 1832. Among his numerous works are editions of Burion's "Pentologia" and Dawes's "Miscellanea Critica," "Considerations on the Abolition of Slavery," "First Principles of Christian Knowledge," and many others, theological, classical, and political.

BURGH, JAMES, a Scotch writer, born at Madderly, in Perthshire, in 1714, died Aug. 26, 1776. Proving unsuccessful in business, he went to London, where he was employed for one year as a corrector of the press. He then engaged as assistant in the grammar-school at Marlow; after which, in 1747, he opened a school on his own account at Newington, which he continued for 22 years. While at Marlow he published his "Britons' Remembrance," which passed through 3 large editions in less than 2 years. It was published anonymously, and its authorship was ascribed to some of the chief dignitaries of the church. He published numerous political pieces, and was, during many years, a frequent contributor to periodicals. His principal writings were "Thoughts on Education," "Political Disquisitions," the "Dignity of Human Nature," "Ordo, or Essays," and a Utopian romance under the title of the "Settlement, Laws, Government, &c., of the Comores, a people of South America."

BURGLARY (Law Lat. *burgi latro*, one who breaks into a house or enclosed place; See. *latro*, a house-breaker); in old English law called *Hame-saken*, as it still is in Scotland, the crime of breaking into a dwelling-house or building connected therewith, at night, with intent to commit a felony. Formerly it included

breaking into a church, because, as explained by Lord Coke, the church is *domus mansionalis Dei*; so, also, according to Spelman, it included the breaking the gates or walls of a town, which might in like manner have been said to be the mansion of the garrison or corporation. But, by the English statutes now in force, burglary is limited to the breaking into a dwelling-house; the breaking into a church is also made an offence, but not under this designation. To constitute burglary it is held: 1. That the house broken into must be a place of actual residence; yet, if it is habitually occupied, the fact that no one was in the house at the time of breaking into it will make no difference in the character of the offence. An outhouse, if immediately connected with the dwelling, is deemed a part thereof, so as to make the offence of entering it the same; and in England this rule has been extended to barns, stables, &c., though not under the same roof with the dwelling-house, or contiguous, provided they are in a common enclosure, called curtilage. So also a room in a private house which the lodger occupies as his own independent of the control of the proprietor of the house, or a room in a college or inns of court, is in law deemed the mansion of the occupant, and the breaking into it would be the same as the breaking through an outer door. But in a hotel or boarding house, where the apartments are under the management of the proprietor of the house, and there is a common entrance to them, the whole constitute but one mansion. 2. There must be an actual breaking, as opening a door or window; for, if found open, the entering thereby would not be burglary. But the mere lifting the latch of a door, or the shoving up a window which has no fastening, would be burglarious—much more the picking of a lock or removing any fastening. The breaking of an inner door, when an entrance has been made through an open outer door or window, would, however, be burglary; so, also, knocking at a door, and upon its being opened, rushing in with felonious intent. 3. It must be in the night, not by day. The peculiar criminality of the offence is the supposed danger to life. The English rule is, that if there is daylight enough to distinguish a man's face, the entering of a house will not be burglary. This does not include moonlight, for the offence is not so much that it is done in the dark as at an hour when the inmates of the house would be unguarded. In the state of New York, burglary in the 1st degree is defined to be "the breaking into and entering in the night time the dwelling-house of another in which there shall be a human being, with intent to commit some crime." Breaking into a house in the day time, under circumstances that would at night have constituted burglary in the 1st degree, is declared to be a burglary in the 2d degree. So, also, the entering by an open door or window at night and breaking an inner door with intent to commit a crime. Breaking into an outbuilding not forming a part of a dwelling-house,

or into a shop, warehouse, &c., with intent to steal, is burglary in the 3d degree. The punishment of burglary is various in the different states—usually imprisonment in state prison for a term of years.

BURGOMASTER (Ger. *Bürgermeister*, chief of the citizens), in German and Dutch towns, the chief executive municipal officer; in France called *maire*; in England, mayor. Burgh is synonymous with borough; a burgess is the holder of a tenement in a borough.

BURGONET, the upper part or ridge, above the crown-piece or curvilliere of the ancient helmet of the man-at-arms, upon which the heraldic crest of the knight's family, or, if he was royal, of his kingdom, was attached, and to which a panache of feathers was sometimes superadded. Hence burgonet is, sometimes, used to signify the heraldic crest itself; and, at other times, the entire knightly casque, so crested.

BURGOS, a Spanish city, and capital of the province of the same name, formerly the capital of Old Castile. Pop. in 1852, 15,924. Its origin is uncertain, probably not older than the 7th or 8th century. It is an irregularly built city, in the form of an amphitheatre, on the banks of the Arlanzon, over which there are 3 stone bridges. The environs are delightful, and the city has an ancient and picturesque appearance. In the upper part of the town are still shown the arch and mausoleum erected to the memory of Gonzalez and the Cid. The cathedral is a fine Gothic structure, and contains the tombs of many old knights and kings. The town hall is also worthy of notice. A court has existed here since 1835, forming a branch of the chancellery of Valladolid. There are a university, a college, a public library, a theatre, a museum, and an archiepiscopal seminary. There are about 80 looms employed in making woollen goods, 140 looms in linen goods, 14 shops engaged in the manufacture of saddles and bridles, 7 hat manufactories, 14 flour mills, 3 chocolate mills, a spirit manufactory, and a large paper mill and hardware factory in the suburb of Vega. Statues of Gonzalez, Alonso III., Enrique III., and Fernando I., are on the Espolon, a charming walk. Burgos was in former times renowned for its great number of churches and convents, but the church of San Idefonso is now a depot of artillery, San Agustin is an inn, San Juan Bautista a prison; the famous monastery, Frex del Val, has been sold to a contractor for the materials, and Trinidad and San Francisco, and others, are pulled down. Burgos was the scene of an engagement, March 10, 1808, in which Soult defeated the Spaniards. It was also besieged twice by Wellington, and on each occasion suffered the horrors of an assault.

BURGOS, FRANCISCO XAVIER DE, a Spanish statesman and author, born at Motril, in Granada, Oct. 22, 1778. He studied first theology, and then law, and under King Joseph Bonaparte, in 1810, was appointed sub-prefect of

Almeria. He fled to France in 1812, on the return of Ferdinand VII. to Spain, and devoted his leisure to making a translation of Horace. In 1824 he was made agent to effect a government loan at Paris, and concluded the business with the banker Guehard in a way to secure his own fortune. He was recalled from Paris in 1827, and became in 1833 minister of the interior, and afterward of finance; but was removed from the ministry by the influence of Martinez de la Rosa. He was accused by Gen. Alava of maladministration in contracting the loan, and although a committee of investigation declared him innocent of the charges, he yet wholly withdrew from public life. He lived in Paris till 1839, where he occupied himself with writing his yet unfinished "History of the Government of Isabella II.," after which he returned to Granada. He has published 8 comedies, a few poems, and a variety of miscellaneous articles on literature, the arts, and commerce.

BURGOYNE, JOHN, an English general, born about 1740, died in London, June 4, 1792. An illegitimate son of Lord Bingley, he entered the army at an early age, and, while a subaltern, made a runaway match with a daughter of the 11th earl of Derby. In a short time the earl received his son-in-law into favor, settled £300 a year on him (besides leaving him a legacy of £25,000 at his death, in 1776), and used the family interest to push him on in the army. He served in Portugal with much credit, as brigadier-general, in 1762. He sat in parliament, from 1761, for the borough of Milburst. In 1768 he contested the borough of Preston at an expense of £10,000, and for excesses which, it is said, his partisans committed, was prosecuted and fined £1,000. In the letters of Junius he was severely dealt with, on account of his presumed political connection with the duke of Grafton. In 1772, on his motion, parliament appointed a committee of inquiry on Indian affairs, and in the following year he moved, unsuccessfully, for a vote of censure on Lord Clive. In 1775 he was appointed to a command in America, where the war of independence was just commenced. He witnessed the battle of Bunker hill. In 1776 he returned to England, and had a long conference with George III. on colonial affairs. In 1777 he was appointed to lead the army which was to penetrate from Canada into the United States, in which the Americans threw in his way difficulties which he could not overcome. At last, the Americans, under Gates and Arnold, surrounded him, while he was encamped at Saratoga, and compelled him to capitulate, with the whole of his army. The news of this surrender was indignantly received in England. Returning thither on parole, in May 1778, he was ill received. The king refused to see him. A court-martial which he demanded was refused, on the plea that, according to precedents, a prisoner on parole could not be tried. He published a narrative, which cleared away some of the prejudice against him, and

ably vindicated himself in parliament, attributing the disasters in the war to Lord G. Germaine, the American secretary. He threw himself into the arms of the opposition, and a ministerial attempt was made to exclude him from the house of commons, on the pretence that as a prisoner of war he had no right to speak or vote, but the speaker decided in his favor. He then resigned all his appointments. At the close of the American war, when a change of ministry took place, he was restored to his rank in the army, appointed commander-in-chief in Ireland, and sworn in as privy councillor. Two years afterward he retired from professional life, devoting himself almost wholly to literature. In 1774 he had written a vendevilla, the "Maid of the Oaks," to be performed at Lord Derby's suburban seat (the Oaks), near Epsom. In Jan. 1780, he produced a comic opera, "The Lord of the Manor," taken from the French, and still a stock piece. In 1789 he wrote the comedy of "The Heiress," which is occasionally performed yet. These were his principal dramatic productions. He contributed 2 pieces to "The Rollad." He was one of the houses of commons managers for impeaching Warren Hastings, but died ere the trial was concluded, from an attack of the gut. His plays and poems were collected and published in 2 volumes in 1808.

BURGOYNE, SIR JOHN FOX, British general, born about 1732. He entered the army in Aug. 1798, as second lieutenant of engineers; served at Malta, in Egypt, in Sicily, and in Sweden, from 1800 to 1807; was with Sir John Moore in the peninsula in 1808, under Wellington from 1809 to 1814, and was present at the principal battles, and at all sieges; conducted those of Burgos and San Sebastian; and was twice wounded. In 1814-'15 he was engineer-in-chief of the attack on New Orleans, and was sent to Portugal in the same capacity in 1822. He was made colonel in 1820; appointed chairman of the board of public works in Ireland in the same year; created knight of the bath; made major-general in 1828; appointed inspector-general of fortifications of England in 1845; sent to Ireland as head of the famine-relief commissioners in 1847; placed at the head of the metropolitan commission of sewers (for the drainage of London) in 1841; made lieutenant-general in 1851; advanced as knight grand cross of the bath in 1852; sent to Turkey in 1854, to provide for the defence of Constantinople, and free passage through the Turkish waters; returning to England, he was despatched to the Crimea as chief of the engineering department against Sebastopol; was present at the battles of the Alma, Balaklava, and Inkermann. In 1855, in consideration of his long services and advanced age, he was recalled, Sir Harry Jones succeeding him, but at the pressing request of Lord Raglan, the commander-in-chief, remained 3 months longer with the army. In 1855 the sultan bestowed on him the order of the Medjidie, and he was created a baronet in 1856. The celebrated letter of the

duke of Wellington, showing how ill prepared England was for war and against invasion, was addressed in 1847 to Sir John Burgoyne, then inspector-general of fortifications.

BURGUETE, a town of Spain, in the valley of Roncesvalles, Navarre, memorable for the defeat of a part of Charlemagne's army, under Roland, in 778.

BURGUNDIANS, or **BURGUNDII**, the name of a primitive German race, a branch of the Goths, whose original territory lay between the Oder and the Vistula, from which they were driven out by the Gepidæ. They settled on the shores of the Rhine and Neckar, and in A. D. 407, joining the Suevi, Alani, and Vandals, who invaded the country, they formed part of an army of 80,000 men, which, under the command of King Gundicar, penetrated into Gaul, settling between the Aar and the Rhone, and setting up the Burgundian empire, which lasted till A. D. 534, when King Gondemar lost his life in the battle against the Franks, who took possession of Burgundy. One of Gondemar's predecessors, Gundebald, was the author of the *Lex Gundebalda*, and a subsequent Burgundian king, Sigismund, embraced Catholicism. The Christian doctrine which first obtained among the Burgundians, and to which they became converts shortly after their arrival in Gaul, was that of the Arians. One of their kings, Gundicar, was the first who endeavored to stem the progress of Attila; but he, and his army of 10,000 men, became victims of their bravery, and died to the last man on the battlefield. The description of the brilliant career of this heroic race forms one of the most remarkable passages of the *Nibelungenlied*.

BURGUNDY (Fr. *Bourgogne*), the name of 3 kingdoms varying somewhat in extent and locality, of a feudal duchy, and lastly of a French province. I. **THE FIRST KINGDOM OF BURGUNDY** was founded about 418 by the Burgundians, a German nation, who, after leaving the country between the Oder and the Vistula, wandered through Germany, and finally settled in the S. E. of Gaul. These peaceful conquerors gradually extended their dominion all over the valleys of the Saone and the Rhone, their possessions being bounded N. by the Rhine, the Faucilles mountains, and a winding line falling in a S. E. direction to the Loire; E. by the Alps and the Reuss river; W. by the upper Loire, Ardèche, and lower Rhone; S. by the Mediterranean sea. Consequently they included the provinces of France known afterward as Burgundy, Franche-Comté, Lyonnais, the N. E. part of Languedoc, Dauphiné, and Provence, with the western parts of Switzerland and Savoy. About the year 500, the Frankish king, Clovis, impelled by his wife Clotilde, a Burgundian princess, desirous of avenging her father's death, invaded Burgundy, and imposed a heavy tribute. Some 80 years later, the sons of Clovis conquered the kingdom, which, in 534, became a part of the Frankish empire. It, however, preserved its name and

national laws, and more than once had Merovingian kings of its own. II. **CISJURANE AND TRANSJURANE BURGUNDY**. The Frankish dominion over Burgundy had lasted 8½ centuries, when the dismemberment of the Carolingian empire occurred, and Burgundy was among the first to assert its independence. In 879, a number of bishops and noblemen assembled for that purpose, and conferred the crown upon the count of Vienna, Boso, a mild and prudent prince, brother-in-law of Charles the Bald of France. The new king was crowned at Mantaille by the archbishop of Lyons, and his kingdom, from its situation in respect to France, was called Cisjurane, and sometimes Lower Burgundy, consisting of western Franche-Comté, southern Savoy, Dauphiné, and Provence, with a part of Lyonnais. A little later, Count Rudolph of Upper Burgundy founded a 2d kingdom of Burgundy, the Transjurane, formed of western Switzerland to the Reuss, eastern Franche-Comté, and northern Savoy. The 2 kingdoms were united in 980, but not integrally, under the name of the kingdom of Arles, which continued for about a century. Meanwhile the kings of Arles or Provence, as they were also called, being unable on account of their weakness to contend successfully against the growing power of their nobles, were obliged to acknowledge the supremacy of the German emperors. Consequently, on the death of Rudolph III., in 1032, the emperor Conrad II., as lord paramount, took possession of the kingdom, so that the S. E. part of France became one of the provinces of the German empire. It was now governed by imperial vicars; but in the beginning of the 14th century, the various provinces of which it consisted separated; some, like the Swiss cantons, asserting their independence, others acknowledging the power of their own feudal lords, but most of them going back to the French kings. III. **DUCHY OF BURGUNDY**, 1st ducal house. While these kingdoms were passing through these revolutions, the N. W. part of old Burgundy had remained united to France, and formed one of its great feudal provinces. We find, in the 10th century, the duchy of Burgundy belonging to Henry, brother of Hugh Capet, the first king of the 8d dynasty, and a little later, to the 2d son of Robert the Pious, of France. This prince, who died in 1075, was the head of the first ducal house of Burgundy, which lasted till 1861. His successors, 11 in number, were among the 12 peers of France, and rivalled the most powerful princes of their times. They increased their family inheritance, especially by the annexation of the county of Burgundy or Franche-Comté, one of the provinces dismembered from the kingdom of Arles, and were beside, during the 13th and 14th centuries, possessors of a kingdom and 2 principalities in the East. They proved singularly constant in their loyalty to the French kings. Several of them engaged in crusades, especially Hugues III. and his grandson Hugues IV., each of whom twice

visited the Holy Land. The latter accompanied Louis IX. in his expedition to Egypt, participated in his captivity, and was liberated with him. By a treaty with Baldwin II., emperor of Constantinople, he became himself king of Salouina, which title remained for years in his house. Louis IV., the last but one of the family, besides that kingdom had also the principalities of Achaia and Morea.—**SECOND DUCAL HOUSE.** On the death of Philip de Rouvre, the last of the preceding family, the duchy of Burgundy reverted for a short time to the crown of France. King John, being desirous of rewarding his 3d son, Philip, summoned the Bold, who had fought gallantly by his side in the battle of Poitiers, resolved to bestow this rich inheritance upon him. John's bequest was honorably executed by his son and successor, Charles V. of France; and on June 2, 1364, PHILIP received the investiture of his duchy. He soon married Margaret of Flanders, who, on the death of her father, brought him the countries of Flanders and Artois, beside several other rich possessions. Philip at once gave evidence of his power and wealth by contributing largely to the organization of the army which, in 1396, was sent to assist the Hungarians against Sultan Bajazet. John, count of Nevers, heir of Burgundy, a young man, was appointed to command the expedition, the real chief of which was the celebrated Enguerrand VII., lord of Coucy. The army was destroyed by the Turks at Nicopolis, young John being taken prisoner, and his father had to pay very large sums for his ransom, which circumstance obliged him to tax his subjects heavily. Philip the Bold had also to conduct the government of France during the minority and afterward insanity of his nephew, Charles VI. By his prudence the calamities of civil war were for a time avoided; but the unceasing want of money to meet his extravagant expenditures, both private and public, forced him frequently into measures not conducive to national welfare. On his death, the treasury was empty, so that his sons had to sell his plate to defray the expenses of his funeral. He died in 1404, generally regretted, not on account of the good he had done, but because every one foresaw what animosities and misfortunes were to be the consequences of his death.—**JOFFY THE FRENCHMAN,** his successor, took immediate measures to procure for himself the same influence as his father had possessed in the government of France, but was opposed by the queen, Isabella of Bavaria, and the duke of Orleans, brother of the king. In the fury of civil contest, John hired assassins to murder his rival, and the duke of Orleans fell a victim in the very midst of Paris. Such, however, were the power of the duke and the spitality of the times, that he would probably have obtained a justification of his conduct from the court, had he not been obliged to retire to his territories to quell an insurrection of the citizens of Liège; the partisans of Or-

leans took advantage of his absence to call for justice, and being joined by all the enemies of Burgundy, they soon formed a very powerful faction. But John held out successfully against them; therefore they concluded that, to get rid of him, there was no other means than that he himself had resorted to. A plot was devised for his assassination. Ambassadors were sent, in 1410, to invite him to an interview with the dauphin on the bridge of Montreuil, in order that they might together consider measures for the defence of the kingdom. He went to the appointed place with a very scanty train, armed only with such weapons as gentlemen of the period usually wore on visits of courtesy. He had been scarcely introduced to the dauphin, when some high words were exchanged, upon which the partisans of young Charles, who were all Orleansists or Armagnacs, raised the cry of treason, and immediately struck the defenceless John down by axes and swords, his companions being also mercilessly butchered.—**PHILIP THE GOOD,** his son and successor, was eager to avenge his murder, and he unhesitatingly entered into alliance with Henry V. of England, and recognized him as the legitimate heir to the crown of France, on condition that Charles VI. should not be deprived of his regal dignity during the remainder of his unhappy existence. The war between the English and French now became identified with the feud between the Burgundians and Armagnacs, and was marked on both sides by shocking atrocities. For 16 years Philip held to his unflinching desire of vengeance against the dauphin, now become King Charles VII.; but at last the miseries of France, the entreaties of the pope, and perhaps the remembrance of an appeal addressed to him by Joan of Arc, modified his heart; consequently he opened negotiations with the king, which resulted in a reconciliation in 1435. From that time the tide of prosperity flowed in favor of the French, who gradually expelled the English from their territory, and the assistance of the duke of Burgundy largely contributed to this result. Meanwhile he devoted himself to the improvement of his dominions in the Low Countries. His brilliant court realized the visions of chivalry; the jousts and tournaments given under his sanction surpassed in magnificence any that had yet been witnessed in Europe; the wealth of the commercial cities in Flanders was freely poured forth to defray the expenses, and noble knights from all parts of Europe flocked to the court of Burgundy. Philip was the most respected sovereign of his time; he had nothing to fear from his most powerful neighbors; he generously welcomed at his court the dauphin Louis, then an exile from France; encouraged the artists and learned men; instituted the order of the golden fleece on the occasion of his marriage with Isabella of Portugal, and evinced wisdom as well as liberality. He purchased the county of Namur, inherited the duchies of Brabant

and Limbourg, and obtained by treaties the counties of Hainault, Holland, Zealand, and Friesland, as well as the duchy of Luxembourg. By these acquisitions he became a more powerful sovereign than his suzerain the king of France himself; and certainly, if he had wished it, could have assumed the title of king and asserted his entire independence. But he was satisfied with the consciousness of his power, and, during the 43 years of his reign, he had the gratification of seeing Burgundy the most wealthy, prosperous, and tranquil of all the states of Europe. He died in 1467; and the grief for his loss was increased by the dread which the character of his successor inspired.—CHARLES THE BOLD, who, as count de Charolais, was noted for his rashness, pride, obstinacy, and cruelty, more signally manifested the same qualities as soon as he became duke of Burgundy, and his entire career was but a succession of daring follies and rash eccentricities that finally brought him to destruction. Another misfortune was that he had to deal with the cunning and unscrupulous Louis XI. This shrewd prince knew too well how to incite the fury of that mad bull, as he used to call his cousin of Burgundy. The whole life of Charles was but an open or secret conflict against Louis. The latter was instrumental in the rebellion of several cities in the Low Countries, which the duke soon reduced and severely punished. In revenge he entered the "league of the public weal," which had been formed against Louis XI. by some discontented French princes, and forced him into a disadvantageous treaty at Conflans. The king, however, did not discontinue his intrigues, and the powerful city of Liège rebelled for the second time. Just at that moment, Louis, escorted by a feeble company of his personal retainers, was paying a visit to Charles at Péronne; on the intelligence of the new revolt of Liège, the duke kept his sovereign a prisoner, and swore that he would take his life. The crafty Louis succeeded partly in soothing his anger, but could only regain his liberty by submitting to the terms of peace dictated by the duke. The most mortifying condition of his liberation was that he should march in person against the insurgents, and thus aid his vassal in suppressing a revolt which he had himself secretly instigated. Meanwhile, Charles, who aspired to the royal dignity, and wished to obtain it from the emperor Frederic III., had become vicar of the empire in Alsatia. The haughty governor appointed by him over that province encroached upon the rights of cities, then the allies of the independent Swiss. These, fearing for their own safety, entered into an intimate alliance with Louis, and the young René II. of Lorraine, whom Charles had deprived of his duchy, and soon an important war broke out. Charles assembled a splendid army, consisting of 86,000 veteran soldiers, accompanied by the most formidable train of artillery that had yet been brought into the field, and invaded Switzerland. He first be-

sieged Granson, the garrison of which he ordered to be hanged, in spite of the terms of capitulation. The intelligence of this cruelty roused a desire of vengeance among the mountaineers who had flown to arms; they soon encountered the advanced guard of the duke, who was carelessly marching through the mountain defiles, and raising the war cry of "Granson! Granson!" they charged the Burgundians with the utmost intrepidity. The brilliant cavalry of the duke could not withstand the attack of the Swiss pikemen, and commenced a retreat which was at length converted into a precipitate flight. A panic dispersed the whole army of Charles, which left to the victors the richest booty that had been gained in war for several centuries. This defeat, which took place March 8, 1476, inspired Charles with such grief and rage that for weeks he was in a state bordering on insanity. At last he resumed his wonted spirits, and with unparalleled eagerness he attended to the recruiting of his army. Neither treasures nor efforts were spared to make it stronger than ever. The duke even had recourse to threats and violence to bring in soldiers from all his provinces; he moreover hired auxiliaries from France, Italy, and England. At last his troops were ready, and he marched from Lausanne toward Morat, which the Swiss had fortified, and in the vicinity of which their volunteers were slowly assembling. The town resisted with the utmost energy, and gave time to the Swiss to gather all their forces. They then advanced to its relief, and took a formidable position. The heedless Charles rushed to attack them, June 22, but was soon obliged to desist. His troops, assailed by a tempest of rain which injured their powder and relaxed their bowstrings, began to retire; when the Swiss pursued them with such ardor that the Burgundian army was completely routed, and Charles himself forced to flight. This second defeat was the death-blow to his power. The states of Burgundy, Flanders, and Brabant refused to grant him the enormous sums which he demanded to raise a 8d army, while the duchy of Lorraine, incited by René, attempted to resume its independence. Charles, however, by exhausting his last resources, succeeded in procuring some troops, and went to lay siege to Nancy. René, who had secured the city with a faithful garrison, proceeded to the Swiss cantons to solicit aid against their common enemy. Nancy, by a lengthened resistance, gave René time to accomplish his design. On Jan. 4, 1477, he reappeared before Nancy at the head of the Swiss confederates, attacked the Burgundians, and being helped by the treason of Campo-Basso, an Italian favorite of the duke, won the day. Charles himself was slain in a somewhat mysterious manner, and his body was found, after 2 days' search, lying in a rivulet covered with ice, and disfigured by wounds, some of which had every appearance of being inflicted by assassins. The death of Charles the Bold

was the end of the Burgundian dominion. Louis XI. at once seized on the duchy of Burgundy, Franche-Comté, Flanders, and Artois, as escheated French fiefs; he was, however, obliged to resign Franche-Comté, but managed to keep the other provinces. Mary, the heir-ess of Charles, married Maximilian of Austria, whose the pretensions of Austria to the ownership of the Burgundian provinces. The Low Countries and Franche-Comté were, however, all that it ever possessed. But the contests brought on by the conflicting claims were the origin of prolonged wars between France and Austria.—*THE PROVINCES OF BURGUNDY.* The duchy proper, from its reunion to France in 1477, became one of the most important provinces of the kingdom. It was, moreover, one of the most loyal. When Francis I., by the treaty of Madrid, agreed to give back to Charles V. all the provinces once belonging to the ducal house of Burgundy, the states of the province solemnly protested that they were French, and the king had no right to give up his subjects, if the latter were not willing to renounce their allegiance. This province has formed the departments of Côte d'Or, Saône-et-Loire, Ain, and part of Yonne. It was celebrated for its industry and commerce, but above all for its wines, which still preserve their ancient fame.

BURGUNDY WINES. These famous French wines, deriving their name from the ancient province of Burgundy, have a reputation superior to their popularity. They are nevertheless wines of delicious flavor and bouquet. It has been supposed that they would not well bear a sea voyage, but it is now settled that when transported to America and back, their quality is greatly improved. The most renowned red wines of Burgundy are Romanée-Conti, Clos Vougeot, Chambertin, and Richebourg. Chambertin was the favorite wine of Louis XVI. and of Napoleon. Chablis, a white wine, has many admirers, but is inferior to the best growths of the Garonne and the Rhone. The annual produce of wine in Burgundy and Beaujolais is estimated at about 7,000,000 gallons, of which $\frac{1}{4}$ is consumed in France and $\frac{3}{4}$ are exported.

BURL, the name of a very valuable palm, found only in the Philippine islands. The trunk is used in the construction of dwellings; sugar and brandy are made from the sap; the long, tough leaves make excellent mats; the pith is made into cakes, equal to sugar bread; the chaplets and rosaries of the converted natives are made from the seeds; and the spines and stems of the leaves yield a strong fibre, which is woven into a cloth called *saguna*.

BURIAL. The natural tenderness felt by men for the bodies of those who were dear to them, as well as the necessity of removing from sight or contact objects which rapidly become offensive, has in all ages led to some disposition of the dead by which it was thought these souls could best be affected. Funeral rites, too,

have in all ages been interwoven with and consecrated by the ceremonies of religion: portions of these rites have often survived the people and the religion to which they owed their origin, and the threefold speaking with earth with which the Christian is consigned to the tomb is handed down to us from the pagan Greeks and Romans. Three methods chiefly, at different times and in different countries, have been employed for the disposition of the dead: mummification, incineration, and interment. Mummification was practised by the Egyptians from the most remote period to the 6th century of the Christian era. They embalmed not only human corpses but those of various animals, as the ibis, the hawk, the monkey, the cat, together with those of the greater part of the animals that were known to them. This preservation of the bodies of the dead, through a series of ages, gave rise to an enormous multiplication of mummies. "All this," said an Arab to a French savant, showing, from the summit of the great pyramid, the immense plain which for the space of 60 square leagues extends about its base, "all this is mummy."—The Hebrews in general buried their dead, though, from a passage in Isaiah (*chap. xxx., v. 25*), it would seem that incineration was likewise practised. The cemeteries were invariably situated without the walls of the cities.—Among the Greeks, in historical times, the bodies of the dead were indifferently interred or burned, and a common word (*ταφος*) is used for either method of burial. When the body was not burned, it was placed in a coffin made commonly of baked clay or earthenware, and buried without the town; intramural interment was forbidden, from the superstition that the presence of the dead brought pollution to the living. If burned, the body was placed upon a pyre built of wood, to which fire was communicated in the presence of those who had attended the funeral; when the flames were extinguished, the bones were collected and placed in urns made of various materials. These were preserved in tombs, built commonly on the roadsides without the city gates. The burial of the dead by the nearest related survivors was a sacred duty, and its neglect exposed them to grave accusations. After the funeral the family of the deceased partook of a feast at the house of the nearest relative, and at Athens the period of mourning continued 30 days, during which other sacrifices and feasts were celebrated. In the representation of these ceremonies on monuments, a horse's head is usually found in one corner, intended to represent death as a journey. The punishment of certain criminals was heightened by the denial of funeral rites, and there were places both at Athens and Sparta into which the bodies of such criminals were cast.—In the older times of the republic the Romans generally buried their dead, though burning was likewise practised. Sylla appears to have been the first of the Cornelian *gens* who was

burned. Under the empire burning became customary, until it was subverted by the gradual spread of Christianity, and at the end of the 4th century it had again fallen into general disuse. The funeral rites varied not only with the wealth of the deceased, but somewhat, too, in different periods of the commonwealth. In the latter days of the republic and under the earlier emperors, the corpse of the man of wealth was washed, anointed with oil, and perfumed by the slaves of the undertakers, who, from residing near the temple of Venus Libitina, where all things necessary for funerals were sold, were termed *Libitinarii*. A coin was placed in the mouth of the corpse to pay its ferriage into Hades, and the body, dressed in the best robes it had possessed when living, was placed with its feet toward the door in the vestibule of the house. If the deceased had received an honorary crown, it was placed upon its head, the couch was often strewn with flowers, and a branch of cypress placed before the door. It was usual to set aside a sum in the will for the funeral expenses; if this had not been done, the heir provided for them according to the extent of the inheritance; when there were a number of heirs, the expenses were assessed upon them according to their respective shares. The funeral took place at night. The procession was headed by musicians; these were followed by hired mourners, who lamented and sang the funeral song; after these came the freedmen of the deceased, sometimes amounting to a considerable number, wearing the cap of liberty. Immediately preceding the corpse were persons bearing waxen masks representing the ancestry of the deceased; the corpse itself, placed upon a couch, was commonly borne by the freedmen or by the immediate relatives; the family followed after—the men, contrary to usual custom, with their heads covered, the women with their heads bare, their hair dishevelled, and often beating their breasts and uttering piercing cries. If warranted by the rank of the deceased, the procession passed through the forum, and an oration was there pronounced over the body. Finally, the corpse, with the couch upon which it was borne, was placed upon the funeral pyre, built commonly in the form of an altar, with four equal sides. The nearest relative, with averted face, kindled the pyre, and perfumes, oils, articles of food, ornaments, and clothing were frequently thrown on while it was being consumed. When the pile was burned down, the embers were extinguished with wine, the bones and ashes carefully collected by the nearest of kin, sprinkled with perfumes, and placed in an urn. The urns were of various forms and materials, and were buried in sepulchres common to those of the same family. After a funeral the mourning and sacrifices were continued for nine days, though by the women mourning was sometimes worn for a year on the death of a husband or father. As the Christian religion gradually obtained the

ascendency, a corresponding change took place in the mode of disposing of the dead; bodies were no longer burned but interred, and the offices of the church were substituted for the rites of paganism.—At a very early period it became customary to bury the dead in the immediate neighborhood of the churches, in grounds consecrated for the purpose. As the churches were always surrounded by a vacant space of greater or less extent, for a long time this practice was unattended by any evil effects; but in towns, as the population increased and interments became more numerous, the burial grounds often became entirely too small for the necessities of the public; under such circumstances, the accumulation of bodies in a limited space led, at each new burial, to scenes shocking to the feelings of the community, while the disengagement of gases resulting from their decomposition proved deleterious to the general health. In London, in some of the poorer districts, the soil of the churchyards was raised 2, 3, or even 4 feet in a few years, and in the immediate neighborhood of such burial grounds, epidemic diseases were both more common and more fatal. Within 80 years there had been interred in a space not exceeding 818 acres, 1,500,000 bodies. ("Report on a general Scheme of Extramural Sepulture," by the general board of health, London, 1850.) Beside the contamination of the atmosphere in the immediate neighborhood of burial grounds, accidents have occurred from the carbonic acid, given off in them during decomposition, breaking into the cellars of buildings in the neighborhood. This occurred several times in the cellars of houses in the immediate vicinity of the cemetery of the innocents at Paris, between the years 1774 and 1780.—The period it takes for the body to decay after inhumation varies greatly according to the climate, the nature of the soil, and the covering in which it is enveloped. Orfila and Lesueur in their experiments found nothing but the skeletons left of bodies that had been buried 14, 15, and 18 months; this period was, however, unusually short. Low, damp grounds, particularly when they are percolated by water, hasten decomposition; dry, high, and well-ventilated ones, on the contrary, retard it. When numerous burials, within a comparatively short period, have occurred in a limited space, the earth becomes saturated with the products of decomposition to such a degree as to be incapable of further absorbing them; decomposition under such circumstances is retarded, and its products escape directly into the atmosphere. On being left undisturbed for a few years, the earth recovers its previous powers of absorption.—**BURYING ALIVE.** The facts that persons have occasionally presented all the ordinary signs of death, yet have afterward revived, and that others have undoubtedly been buried as dead who were still living, have repeatedly drawn the attention of both individuals and governments to the means necessary to guard against so terrible an occurrence. Winslow, the celebrated

anatomist, is said to have been twice nearly buried alive, and it was in consequence of this that he published a treatise on the signs of death, in which he comes to the conclusion that indications of incipient putrefaction are the only signs that can be relied on. Putrefaction, however, comes on at very variable periods, and it is not always convenient to wait for its occurrence. The rigidity of the muscles that supervenes after death is a sign scarcely less certain, but it is sometimes transitory in its nature. For these signs M. Bouchut proposes to substitute the careful exploration of the cardiac region by auscultation. During a fainting fit the heart is still heard to beat, and in the dying, after the last expiration has proclaimed that all is over, after the pulse has ceased to beat, and after the hand applied over the heart finds every thing still, the ear placed upon the same region still hears for a time the beating of that organ; but when, after having listened for a sufficient time, the practised auscultator cannot distinguish the beat of the heart, life is over. (*Traité des signes de la mort*, &c. by E. Bouchut, Paris, 1849.) In examining the heart in a number of the dying, M. Bouchut found that the longest interval between the pulsations was 9 seconds; from a similar investigation M. Rayer found it to be 7 seconds. "If," concludes the latter, "the absence of the pulsation of the heart is verified by the auscultator for a period 50 times as great as the longest observed period, or for an interval of 5 minutes, the patient is undoubtedly dead." Even this, however, admits of some exceptions. In new-born infants the action of the heart may have ceased for a longer period, and yet the child revive, and the same thing is said to have occurred in the cold stage of Asiatic cholera. M. Michel Levy proposes on these accounts that the verification of disease should take place at 3 periods, separated by an interval of 24 hours, and considers that if, on both these occasions, the absence of all movement of the heart for a sufficient length of time is noticed by a competent observer, the interment may take place in perfect safety. When by an excess of precaution farther evidence of death may be desired, he recommends the application of an iron heated to redness to the skin; this has the double advantage of distinguishing between real and apparent death, and of roasting the patient energetically where death has not occurred. The application of a red-hot iron to the living body for a length of time sufficient to cause the total destruction of the whole thickness of the skin, the injury being surrounded by a vivid redness, causes in the dead body merely a slight shrivelling of the epidermis, and a searing of the superficial layer of the true skin. To prevent the occurrence of premature interment mortuary houses have been built in many of the towns of Germany, in which the dead are retained for a time before the final interment. A bell-pull is so arranged in connection with the extremities of the corpse, that the slightest motion will sound an alarm,

and summon an attendant constantly on the watch. So far, these precautions have been useless; a surgeon who for 45 years had been attached to the mortuary house at Mentz, had during that period but one single alarm; it occurred from the corpse of an old man; the abdomen having swelled from the discharge of a large quantity of fluid, the arms had fallen lengthwise beside the body.

BURIAS, an island of the Philippine archipelago, lying between the southern end of Luzon and the island of Masbate; area 264 sq. m.; pop. about 1,000. The greater portion of its bold, rocky surface is devoid of any appearance of vegetation; but its few miserable inhabitants, who are all confined to a town opposite to the shores of Luzon, cultivate a little rice and potatoes, which with fish constitute their chief subsistence.

BURIATS, BURATS, or BURATSKI, a nomadic Tartar nation of many tribes, submitted to the Russian empire in 1644. They are a branch of the Calmucks, and muster a force of 32,000 archers. They choose their own rulers, and support themselves by the forging of iron, by other mechanic arts, and by their flocks. They are idolaters, and beside a supreme god, named Octargon Burchan, god of heaven, they worship the planets as inferior deities. A few of these people have been converted to the Greek church, but they retain an affection and preference for their old ceremonies.

BURIDAN, JEAN, a French philosopher who flourished in the middle of the 14th century. He was born in Artois, but educated at the university of Paris, where he afterward acquired great fame as a lecturer. He was a disciple of Occam, and was ultimately driven from Paris by the persecution of the realists. He wrote a commentary on the metaphysics of Aristotle. His celebrity in modern times, however, arises from an apologue which he invented to illustrate the doctrine of free will. "An ass," says Buridan, "placed midway between two bundles of hay, would maintain his position, and die of starvation, if he had no choice; but if he turns to one side or the other for the purpose of satisfying his appetite, then he has choice, and of course freedom of will." This proposition, commonly called "Buridan's ass," was long a source of great perplexity to the schools.

BURIGNY, JEAN LÉVESQUE DE, a French miscellaneous writer, born at Reims in 1692, died in Paris, Oct. 2, 1785. In his 15th year he began to manifest that insatiable thirst for knowledge which ever after distinguished him. In 1718 he removed to Paris, where, in conjunction with his 2 brothers, he engaged in the compilation of a sort of manuscript encyclopaedia, which, when completed, formed 12 large folio volumes, whence he drew the materials for many of his subsequent publications. His largest work, a treatise on the papal power, is not much esteemed, but his lives of Erasmus, Grotius, Bossuet, and Cardinal du Perron, are interesting.

BURKE, I. A county of North Carolina, abounding in beautiful mountain scenery. It is traversed by the Blue Ridge near its N. W. border. The soil is very fertile in some places, and produces excellent pasturage. Indian corn, wheat, oats, hay, cattle and swine, are the staples. The productions in 1850 were 232,237 bushels of Indian corn, 16,013 of wheat, 36,959 of oats, and 1,200 tons of hay. There were 6 corn and flour mills, 2 tanneries, 28 churches, and 960 pupils attending public schools. Value of real estate in 1857, \$694,898. It was organized in 1777, and named in honor of the statesman and orator Edmund Burke. Area, 450 sq. m. Pop. in 1850, 7,772, of whom 2,132 were slaves. Capital, Morgantown. II. A county of Georgia, organized in 1777, separated from South Carolina by Savannah river. The Ogeechee forms its southern boundary. It has a somewhat hilly surface and a fertile soil. In 1850 Burke county produced 19,175 bales of cotton, a crop exceeded in no county of the state except Houston. During the same year it yielded 643,608 bushels of corn, 28,260 bushels of oats, and 111,282 bushels of sweet potatoes. The value of land in 1856 was \$2,817,650. Limestone, buhrstone, gypsum, agate, chalcedony, and jasper are the principal mineral productions. Trade is greatly facilitated by the central railroad, which intersects the county, and by the Savannah river, which is navigable along its borders. Area, 1,040 sq. m. Pop. in 1856, 15,260, of whom 10,998 are slaves. Capital, Waynesborough.

BURKE, EDWARD, an American judge and politician, born in Galway, Ireland, in 1748, died in Charleston, S. C., March 30, 1802. He was educated at St. Omer's for a priest, visited the West Indies, came thence to South Carolina near the commencement of the revolutionary war, and served as a volunteer in the patriot army. He was a lawyer by profession, and in 1778 was appointed judge of the supreme court of the newly organized state. When Charleston fell in 1780, he again joined the army, but resumed his judicial office in 1782. He was opposed to the federal constitution because he feared consolidated power, was several times a U. S. senator, and wrote a famous pamphlet against the aristocratic features of the society of the Cincinnati, which was subsequently translated by Mirabeau, and used with great effect by him during the French revolution. He became chancellor of South Carolina a short time before his death. Judge Burke was distinguished for his wit; but he was also an upright and earnest republican, and possessed varied accomplishments.

BURKE, EDWARD, a British statesman, orator, and writer, born in Dublin, Jan. 1, 1730, died at Beaconsfield, July 9, 1797. He received the rudiments of his education at Castletown Roche, was afterward put under the tuition of a learned Quaker at Ballitore, in the county of Kildare, and entered Trinity college (Dublin) in 1744. Five years were spent there in the diligent study of the classics, metaphysics, rhetoric,

and history. After taking his bachelor's degree (1749), he made an application for the professorship of logic in the university of Glasgow, which was unsuccessful. His principal taste, at that period, was for metaphysics, and he projected a refutation of the systems of Berkeley and Locke, which he does not appear to have completed. It may be inferred from the acuteness displayed in his subsequent writings that, if he had carried out his purpose, he would have ridden a pretty successful tilt against those masters of the ring. Meantime, he had entered his name in the middle temple at London, and in 1750 proceeded thither to begin the study of the law. It is commonly represented that Burke went up to London as a needy adventurer, dependent upon his pen for support, and willing to take any occupation that might befall him; but the more authentic accounts show that his father was then an attorney in large practice, who made the amplest allowance for his support. (See preface, by his executors, to the "Observations on the Conduct of the Minority in the Session of 1793," a pamphlet not contained in the usual editions of his works.) He was, moreover, of excellent family, by his mother's side; she being the great niece of Miss Ellen Nagle, who married Sylvanus Spenser, the eldest son of the poet. Little is known of his law studies or of his life in London, except that he wrote for the periodicals and newspapers on politics, and in 1755 was offered some place under government in America, which he was deterred from accepting by the opposition of his father. His first separate literary production was "A Vindication of Natural Society," purporting to be by "a late noble writer," in which he imitated the style and manner of Lord Bolingbroke with remarkable adroitness; so much so that many competent critics, such as Warburton and Chesterfield, are said to have taken it for an authentic work. Had they considered it closely, however, they must have discovered in it tokens of a brilliancy of imagination and of a vehement natural eloquence, to which Bolingbroke never attained. It appeared in 1756, and is worthy of note as well for the light which it throws upon the tendency of his speculations at that time, as for its uncommon vigor and beauty of composition. Burke was then in his 27th year; yet, a few months later, we find him publishing his "Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful," a treatise which for many years occupied a first rank in the æsthetic literature of England, although it is now superseded by the profounder researches of the continental writers. The same year he went to Bath for his health, where he married a Miss Nugent, the daughter of a distant relative, Dr. Christopher Nugent. On his return to London, in April, 1757, he is supposed to have published "An Account of the European Settlements in America," 3 vols., although that work is not included in the common editions of his writings. The fact of his

authenticity of it is said to rest upon the still extant autograph receipt for fifty guineas, which he gave to the publisher Dodsley, by whom it was printed. The beginning of a history of England was written by him for the same publisher, and the narrative down to the time of King John printed, when for some reason or other it was suspended. The probability is, that as he was then also employed in writing the "Annual Register," begun by Dodsley in 1763, he scarcely found time for the investigations and studies of his more elaborate undertaking. His pay on the "Register" was £100 per volume. By these various publications he had made himself favorably known, both in literary and political circles, and it was not long before he was invited to an active participation in political life. When Lord Halifax went over to Ireland, as lord lieutenant, in 1761, he made William Gerard Hamilton, often designated as Single Speech Hamilton, his chief secretary, who made Burke his private secretary. The services and talents of the latter secured him, in April, 1766, a pension of £300 per annum on the Irish establishment; but as Hamilton, who had been instrumental in getting it for him, conceived that Burke was thereby bound to him for life, the indignant young pensioner speedily surrendered the bounty. On the breaking up of the Grenville administration, two years later, the marquis of Rockingham assumed the management of affairs, and appointed Burke his private secretary. Soon afterward he was brought into parliament as member for Wendover, in Buckinghamshire, a borough belonging to Lord Verney. The very day he took his seat (Jan. 14, 1766) in this new and appropriate theatre, he made some remarks on the address of thanks to the throne, which attracted the favorable attention of Pitt. Well they might attract his attention, for no man had ever appeared in that scene more wonderfully qualified for acting a leading part in it than Burke. In a little while he became the animating spirit of the Rockingham administration, and in the stormy and perilous debates which grew out of the question of the American stamp act, his eloquent voice was the most effective in securing moderate and conciliatory measures. Out of the house, as well as in the house, his industry was most indefatigable, while his knowledge of every thing pertaining to the history, the condition, and the feelings of the colonies, was exceedingly useful. On the dissolution of the Rockingham government in July, 1766, Burke wrote "A Short Account of a late Short Administration," in which he vigorously defended the policy of the whigs. In the compromise cabinet which Lord Chatham undertook to form he was offered a place, which he declined, as he did a similar offer on the part of the duke of Grafton in 1767. The parliament was dissolved in 1768, when Burke was again returned for Wendover. About the same time, he purchased for £20,000 a beautiful estate near Beaconsfield, Buckinghamshire; a part of the purchase

money having been advanced, at first as a loan, and afterward as a gift, by the marquis of Rockingham. In 1769 Burke published his first political pamphlet, called "Observations on a late State of the Nation," being a reply to another on the "Present State of the Nation." This was followed the next year by his "Thoughts on the Present Discontents," which surpassed in luminousness, vigor, and beauty, any thing that he had yet achieved. In Nov. 1771, he was appointed agent of New York, to represent the interests of that colony near the government and before the people. He was also busily occupied in parliament, in the debates of which he took always a prominent part. During the sessions of 1772-'3 he particularly distinguished himself by his masterly and ponderous reviews of the affairs of the East India company. Still more did he distinguish himself during the next session, 1774, on the state of America, then driven almost into insurrection by the course of the imperial government. His great speech, on American taxation, was delivered on April 19 of that year. On the dissolution of the parliament, he was nominated for the city of Bristol, for which, after a severe and protracted electoral contest of 27 days, he was returned on Nov. 3. On March 22, 1775, he delivered another powerful and eloquent speech in behalf of the Americans, which he subsequently sent to the press. The vehemence with which he entered into the cause of the colonists rendered him unpopular with his constituents, and he was compelled to defend himself in "Two Letters to Gentlemen of Bristol," which evince remarkable independence as well as ability. All the while the questions of the Catholic disabilities and of the trade with Ireland occupied a large share of his attention. On Feb. 11, 1780, he introduced his celebrated bills for regulating the household, the army, navy, and pension pay-offices, ordnance, the mint, the exchequer, &c., which he commended in a speech on "Economic Reform," which for breadth of view, force of reasoning, brilliancy of illustration, and eloquent appeal, is almost without a parallel in the records of parliamentary eloquence. But the splendor of his talents did not reconcile the electors of Bristol to his politics, and on the occurrence of the next election, he declined to stand a candidate. But the country was not destined to lose his services, nor posterity the delights of his oratorical displays. He was returned for Malton, which borough he continued to represent during the remainder of his career. The Rockingham party coming into power in March, 1782, Burke became a privy councillor, and paymaster-general of the forces; but, not possessing an aristocratic family connection, in accordance with the spirit of those days, he was not allowed a seat in the cabinet. No office in the gift of the government was more lucrative than that of paymaster; yet Burke's first act was to introduce a bill for its reorganization, which materially lessened his own emoluments. Wo

may judge of the worth of it, when it is stated that he effected, in that department alone, an annual saving of £47,000. On the death of the marquis of Rockingham, Burke retired for a time; but the ministry of the duke of Portland, in 1783, restored him to his former place. With that year began his labors on East Indian affairs, with his voluminous reports on the administration of justice in Bengal, and other provinces; and for 6 years, to May 7, 1789, he may be said to have lived in India, so deeply was he absorbed in the investigations and trials which arose out of the subject. It was during this interval that he conducted the famous impeachment of Hastings, in which he raised his reputation as an orator to its highest dignity and glory. Yet the arduous labors of the India business were but the prelude to other exertions, which rendered the closing years of his life the most memorable in his history. The great French revolution had broken out, and Burke, with an audacity that almost equals that of the ancient king who sought to curb the risings of the sea, undertook to check, the spread of its doctrines and spirit. In 1790 his "Reflections on the Revolution of France" appeared, and 80,000 copies were sold almost on the day of its publication. It was a magnificent outburst of mingled logic, wrath, and imagination, which aroused a thousand pens in answer, and filled the world with his name. The extremely conservative sentiments of it, which appeared to rebuke every form of popular discontent and resistance of tyranny, led to an open rupture between Burke and Fox, who was then the leader of the whigs in the house of commons. The scene of their separation is described by contemporary writers as the most affecting in the annals of politics, and we cannot even now read the speeches on the occasion without emotion. Burke thereafter stood almost alone in his politics, yet his tongue and his pen were incessantly engaged in the discussion of the themes which filled his heart. His "Appeal from the New to the Old Whigs," July, 1791, his "Letters to Sir Hercules Langrishe," 1792, his "Thoughts on French Affairs," his "Remarks on the Policy of the Allies," 1793, and a variety of other pamphlets, show the activity of his mind as well as the earnestness of his zeal. But on June 20, 1794, he retired from the house of commons forever, conceiving that he had played his part, and conscious of the approaches of age. In August of the same year, the death of his only son, Richard Burke, inflicted upon him a terrible blow, yet he retained his cheerfulness and activity. In 1795 he received a pension of £1,200 from the civil list, and soon after another of £2,500 from the 4½ per cent. fund. In his retirement, however, his pen was still busy, and in a "Letter to a Noble Lord," 1796, he showed all his original splendor and nerve. The same year, also, he published "Two Letters on the Proposal for a Regicide Peace."

Among his latest cares was the foundation of a school for the children of French emigrants. He died in the 68th year of his age, preserving his faculties to the last, and causing to be read to him, on his death-bed, the beautiful essay of Addison, in the "Spectator," on the immortality of the soul.—Amiable in private life, exemplary in all his relations, of unexampled powers of conversation, and munificently accomplished in the various walks of philosophy, science, politics, history, and literature, he had endeared himself to a large circle of friends, as much by the beauty of his character as by the prodigious capacities of his intellect. Burke justly reached by the mere force of his abilities the most elevated positions of statesmanship; as an orator, he stands at the head of British eloquence; his writings, distinguished by "imperial imagination" and a mighty sweep of logic, are still the study of rhetoricians, after the interest of their subjects has mainly passed away; and he leaves to posterity a name unspotted by any vice or weakness. Under such circumstances, even they who cannot coincide with his political theories, are glad to acknowledge his genius, and to admire the uniform probity of his conduct. Americans, especially, will long continue to cherish his memory, because of the useful and magnanimous services he rendered their fathers in the dark days which preceded their emancipation.—A new history of his life and times, by Thomas Mac-knight, was commenced in London, 1858, 2 vols.

BURKE, SIR JOHN BERNARD, an English genealogist, born in London in 1814. His father, the late Mr. John Burke, who died in 1848, was cadet of an ancient family in Ireland, and became attached, as reporter and editor, to the London press. He originated many literary speculations, among others the "Standard Novels," a series of replications, at a tenth of the original price, with new introductions by the authors, and illustrations by able artists. He was the founder and first editor (latterly assisted by his 2 sons) of "Burke's Peerage and Baronetage," long established as the most complete and accurate of its class, and so popular that a new edition is annually exhausted. This work is said to have been one of the most remunerative of the numerous publications of the late Mr. Henry Colburn, of London. In May, 1857, the copyright of this work was sold for a large sum, although burdened with the payment of £400 per annum to whichever of Mr. Burke's sons should edit the "Peerage," as long as it continued to be published. Mr. Burke also brought out the "Extinct Peerage" in 1 vol. 8vo, and the "General Armory of England, Scotland, and Ireland," and the "History of the Landed Gentry."—Sir J. Bernard Burke, called to the English bar at the Middle Temple, in 1839, succeeded him as editor of the "Peerage," and has also brought out revised and extended editions of his other works.

BURKE, JOHN DOLY, author of one of the best histories of Virginia, born in Ireland, edu-

ated at Trinity college, Dublin, was killed in a duel with a Frenchman, near Campbell's bridge, Va., April 12, 1808. He came to this country in 1797, conducted a newspaper at Boston, and subsequently another in New York, where he was arrested under the sedition law. He afterward removed to Petersburg, Va., where he practiced law and wrote his history. He was the author of a few dramas on historical subjects, one of which was entitled "Bunker Hill."

BURKE, WILLIAM, an Irish shoemaker, resident in Edinburgh, arraigned with his neighbor Hare, in Dec. 1825, charged with committing 3 murders. Convicted on one of the indictments he was condemned to death. Shortly before his execution he confessed that in connection with Hare, he had murdered 15 persons since the beginning of 1823, and had sold their bodies to an Edinburgh surgeon. In 1827, a debtor of Hare dying in his house, the latter, to obtain his due, secretly sold the body. Burke was privy to the occurrence, and the facility of the trade prompted them to their career of crime. The victims were in most cases first intoxicated and then strangled. This exposure subjected the British anatomical schools to legal conditions in their means of obtaining subjects.

BUREEL, HERMAN, a German painter, born in Pirmasens, in Rhenish Bavaria, Sept. 9, 1862. He studied at the academy of Munich and in Italy, and gained much reputation by his sketches of Italian life and scenery, of which a "Convey of Brigands" in the Campagna of Rome is the best. Since his return to Bavaria, he has executed a variety of views of the Bavarian mountains and of the Tyrol, a great number of pictures of the popular life around him, and of the cow-keepers' cottages in Switzerland, pastoral sketches of animals, and winter landscapes.

BURKITT, WILLIAM, an English divine, born at Hitcham, in Suffolk, in 1656, died at Dulliam, in Essex, in 1708. He was zealous in collecting aid for the French Protestants who suffered from the revocation of the edict of Nantes; and, through his instrumentality, a minister was procured to preach the gospel in Carolina. He wrote a popular commentary on the New Testament.

BURLAMAQUI, JEAN JACQUES, a Swiss writer upon civil law, born at Geneva, July 24, 1694, died April 3, 1748. His early education was directed by his father, a learned man and secretary of the republic. While engaged in philosophical investigations he felt himself drawn to the study of natural law and of the rights of man; and his progress was such that he was not quite 26 when he obtained the title of honorary professor of jurisprudence in his native city. He travelled in England, Holland, and France, and returning to Geneva in 1728, he began his course of lectures, which brought great reputation to himself and the university. After 15 years he resigned his professorship by reason of ill health, and became a member of the sovereign council, where he continued to render services to the state until his death. The writ-

ings of Burlamaqui are remarkable for the clearness and precision of their style, and have been used as text-books in several of the German universities, and in that of Cambridge, England. He found many of his materials in Grolius, Puffendorf, and Barbeyrac, but these became in his hands freed from every digression and reduced to a geometrical simplicity and order. His principal works are, "Principles of Natural Law," published in 1737, and "Principles of Political Law," 1751.

BURLEIGH, WILLIAM ORCHARD, LORD, born at Bourne, Lincolnshire, Sept. 13, 1529, died Aug. 4, 1593. He has been called the son of a plain country gentleman, but his father was master of the robes to Henry VIII., and could easily introduce him to the ways of courts, which, whether from long habitude or natural temperament, none better understood or pursued. He was educated for the law, and a debate with 2 priests, in which he attacked papal supremacy, so pleased the king that Cecil was at once received into royal favor. At the death of Henry, Cecil continued in favor with Edward VI., and was appointed secretary of state in 1548. On the fall of the lord protector, Somerset, who had been his friend and patron, Cecil was for a time involved in his disgrace; but he found a way of making his peace, and after a short imprisonment, was restored to favor. The duke of Northumberland, Somerset's rival and successor, was also a patron of Cecil, who avoided compromising himself in the question of the succession, and, trimming his sails, adroitly seized an opportunity as soon as he saw that the cause of Mary was likely to be successful, and tendered his submission, which was graciously accepted. During the reign of Mary he took no important part in public affairs, and though a Protestant at heart conformed outwardly to the queen's religion, and thereby preserved a share of royal favor. As a country gentleman, he took part in the debates of the house of commons, and ventured to oppose the government, but in a temperate manner. When Mary's increasing ill health indicated the prudence of such a step, Cecil opened a correspondence with the princess Elizabeth, who, on her accession to the throne, at once appointed him her secretary and eventually lord treasurer. Thenceforward, till the end of his long life, he was in reality Elizabeth's prime minister. In 1571 he was created Baron Burleigh. The wise and eminently prudent policy which distinguished the reign of Elizabeth, is no doubt traceable to Burleigh. Elizabeth's impatient and tyrannical disposition would have involved her government in an endless sea of troubles. The epoch was one in which doctrines dangerous to supremacy were rife; when men's minds, disturbed by new opinions, had not yet settled down into a decided political creed. She had the good sense to discriminate Burleigh's uses to temper her more fiery nature; and no backbiting or aspersions of envious rivals could disparage her trusty servant in her estimation.

Accustomed to thread his way through the wiles of diplomacy, Burleigh was always well informed of the plots which were continually in progress or contrivance against the queen's person or the peace of the country. His sagacity and coolness outwitted them all. Burleigh's public life is the reign of Queen Elizabeth. The brilliant Leicester, the gallant Essex, the chivalrous and polished Raleigh, were the personal favorites of the queen. Burleigh alone held the helm of the English vessel of state. His private life was calm and undisturbed, his personal habits quiet and frugal. His thrift sometimes approached meanness or avarice, but he was not the less honest and upright in his public dealings. He was twice married; in early life to a sister of Sir John Cheke, who died, leaving one son, Thomas, afterward earl of Exeter; his second wife was Mildred, by whom he had Robert, his associate and successor, afterward earl of Salisbury, and two daughters. He survived his second wife by only a few years, and died full of age and honors.

BURLEIGH, WILLIAM HENRY, an American poet, born at Woodstock, Conn., Feb. 2, 1812. Bred on a farm, at 16 he became apprentice to a clothier, then to a village printer, both of whom he abandoned in disgust. He continued, however, to labor in various places as journeyman printer, and finally as editor. In the latter capacity he has had charge of the "Literary Journal" at Schenectady, the "Christian Witness," at Pittsburg, and the "Washington Banner," in which papers, and in others, he has communicated many short poems to the public. A collection of them was published in 1840. Mr. Burleigh has also taken an active part in various religious and social movements.

BURLESON, a central county of Texas, bounded on the N. by Brazos river, drained by 3 forks of the Yegua, one of the tributaries of the Brazos, and comprising an area of 1,025 sq. m. The surface is moderately uneven; the soil of the lowlands is a sandy loam, in many places very productive; that of the uplands is lighter. Timber is abundant, about $\frac{1}{4}$ of the county being covered with red and post oak. The staples are grain, cotton, sugar, and live stock. In 1850 the productions amounted to 1,010 bales of cotton, 10 hogsheads of sugar, 70,000 bushels of Indian corn, 3,620 of sweet potatoes, and 17,280 pounds of butter. There were 4 churches, and 115 pupils attending public schools. In 1857 there were 30,742 head of cattle, valued at \$180,000, and 2,354 horses, valued at \$121,100. The value of real estate was \$637,660, and the aggregate value of all taxable property, \$1,802,706. Formed from Milan county in 1846. Capital, Caldwell. The county was named in honor of Gen. Edward Burleson, vice-president of the republic of Texas. Pop. in 1856, 4,079, of whom 1,342 were slaves; slave pop. in 1857, 1,348.

BURLINGTON, a central county of New Jersey, extending entirely across the state, and

lying between the Atlantic on the S. E., and the Delaware river on the N. W. The surface is level. The soil near the river is remarkably fertile; in other localities it is sandy. Pine woods are found in various parts of the county. Bog iron ore is abundant, and in the western portion are frequently found, imbedded in marl, petrified vegetables, and animal relics, such as shells, bones, &c. Corn, wheat, potatoes, hay, and butter, are the staples. In 1850 the productions were 152,369 bushels of wheat, 888,011 of Indian corn, 159,398 of oats, 41,783 tons of hay (the greatest quantity produced by any county of the state), 688,860 pounds of butter, and 43,781 of wool. There were 30 corn and flour mills, 2 cotton factories, 2 woollen factories, 7 founderies, 4 glass manufactories, 2 paper mills, 52 saw mills, 3 newspaper offices, 88 churches, and 6,771 pupils attending public schools. The Camden and Amboy railroad traverses the county. This county was organized in 1694, and named from Bridlington (commonly pronounced Burlington), a town in England. Area, 600 sq. m. Pop. in 1855, 46,442. Capital, Mount Holly.

BURLINGTON, the name of several towns and cities of the United States. I. A city, port of entry, and the capital of Chittenden co., Vt., situated on a bay of its own name on the E. shore of Lake Champlain. Pop. in 1854, 8,900. Its harbor is the best on the lake, being easy of access from N. and S., protected from W. winds by a breakwater 900 feet long, and having a lighthouse erected in 1826 on Juniper island, at the mouth of the bay. It is the largest place in the state, and in beauty of scenery and location is scarcely surpassed in New England. The ground on which it is built rises gradually from the shore to a height of 281 feet, the summit commanding one of the finest views in the United States. Looking west the eye passes over the city, with its straight avenues, its pleasant dwellings surrounded by trees and gardens, and its elegant public buildings; over the lake, here 10 miles wide, dotted with islands, and furrowed by many vessels, to the Adirondac mountains, which lift their peaks more than 5,000 feet above the water. Eastward lies the broad expanse of fertile land bounded by some of the loftiest of the Green mountains. On the N. is seen the Winooki or Onion river, with the manufacturing village of Winooki, connected with the city by a bridge, and partly comprised in Burlington township. The university of Vermont, comprising 4 large buildings, founded in 1791, and endowed by the state with 29,000 acres of land, the annual revenue from which is \$2,500, occupies the highest ground in the city. It has now (1858) 7 professors, 98 students, and a library of 13,000 volumes. Connected with it is a medical school. The other edifices of most note are 8 churches, a court-house, and a jail, several of which face a central public square. There are 17 schools, an academy, 2 female seminaries, 3 newspaper offices, 5 banks, a custom-house and marine hospital built in 1857, a brewery, a grist mill, and 3 saw-mills. The mercantile business amounts to about \$1,600,000

per annum. Most of the lake vessels are owned here, and the tonnage in 1857 was 5,900 tons. The Vermont central and Canada, and the Rutland and Burlington railroads offer ready communication with all parts of the United States and Canada. Steamboats stop here daily on the way from Whitehall to Montreal, and a steam ferry boat crosses the lake to Port Hope and Plattsburg.—Burlington was first permanently settled in 1783, and organized in 1787. The first store was opened in 1789, and the first Congregational church formed in 1795. During the war of 1812 a garrison and hospital were located here, and during the winter of 1813, so fearful a mortality prevailed among the 4,000 men composing the former, that for several weeks together the deaths were from 13 to 20 a day. The tomb of Gen. Ethan Allen, who died here in 1783, is in a burying ground half a mile E. of the university. II. A city and port of entry of Burlington co., N. J., on the Delaware river, at the mouth of Asssencok creek, 18 miles N. E. of Philadelphia. It was founded in 1677, principally by members of the society of Friends, who, for a long period, exercised a controlling influence over its affairs. It was long the seat of government for West Jersey, and was the official residence of the last colonial governor, William Franklin, until, at the breaking out of the revolution, he was taken thence, a prisoner, to New England. It was in many other respects a leading settlement in early times, entertained the legislature and the county courts, had public fairs, to which thousands periodically resorted, and as early as 1777 supported a printing office and newspaper. It also carried on a lucrative commerce with the West Indies, both before and after the laying out of Philadelphia, built vessels, and subsequently built and fitted out a large privateer, which cruised successfully against the French. It was made the see of a bishop, and St. Mary's Episcopal church was liberally endowed by Queen Anne with lands in and near the city, much of which is held to the present day, together with a massive communion service, presented by the same princess. As Philadelphia increased in importance, Burlington declined. It now (1858) contains about 5,000 inhabitants, 7 churches, 2 Friends' meeting houses, 2 banks, a weekly newspaper, an ancient library, which contains a large collection of very rare and valuable works, and public schools which are richly endowed by a legacy of land from one of the early settlers, now become exceedingly productive. Burlington college, an Episcopal institution, educates a large number of students; and St. Mary's Hall also, under the supervision of Bishop Doane, usually contains about 75 pupils. III. A city, and the county seat of Des Moines co., Iowa situated on the W. bank of the Mississippi river, about 14 miles N. of an easterly extension of the main boundary line between Iowa and Missouri. The W. bank of the Mississippi at this point consists mostly of steep cliffs of carboniferous limestone that attain an

elevation of 150 feet, furnishing an abundance of excellent materials for building, paving, and the manufacture of lime. The stone quarries in this formation offer an interesting field for the investigations of the geologist, being rich in the organic fossils of the carboniferous era, particularly of the crinoid family. Though corresponding rock formations in Europe contain large deposits of lead, but little of that mineral has been found in this immediate vicinity. The summits of these cliffs are capped with some 30 or 40 feet of diluvial clay, that, with a rich surface stratum of vegetable mould, forms the table-land of the surrounding country. At the base of these cliffs the slope of their debris passes into the river. This deep embankment is scooped out through the centre of the city by the waters of a small creek, called the Hawk-eye, which enters the Mississippi nearly at right angles. On either side of this creek, and to the west, about half a mile from the river, where the creek branches to the right and left, the ground gradually rises to the level of the surrounding table land, thus giving to the central portions of the town an arrangement similar to the area of an amphitheatre, and adding much to its beauty and salubrity. On the opposite side of the river low lands, mostly subject to occasional inundation, extend some 7 or 8 miles to the Illinois bluffs.—This town was laid out in 1834, and named after Burlington, Vt. In 1837, when the territorial government of Iowa was established, Burlington became the capital, a distinction it lost in 1840. Possessed of great natural advantages, and intelligent and enterprising inhabitants, Burlington has advanced steadily in wealth and population; the latter now (1858) amounts to 16,000. It is a terminus of the Chicago and Burlington, the Peoria and Burlington, and the Burlington and Missouri river railroads; the first of which lines has been completed now somewhat over 3 years, and the second over 1 year. Eleven religious congregations have churches, viz.: 3 Presbyterian, 2 Methodist, 2 Roman Catholic, 1 Congregationalist, 1 Baptist, 1 Lutheran, and 1 German reformed church. Ample means of education are provided; 2 fine public school-houses adorn the opposite hills of the city, north and south, capable of accommodating from 4 to 6 schools each, and others are in process of erection; while, on the western rise, the Burlington university, a flourishing institution, established in 1854, occupies a conspicuous site. Burlington also possesses 2 daily, 1 tri-weekly, and 4 weekly newspapers, 3 flouring mills, 3 founderies, 1 oil mill, 3 pork-packing houses, 3 banking houses, 9 breweries, 6 saw-mills, 1 starch factory, and 3 soap factories. The extensive coal fields in the vicinity offer unusual facilities for manufactures.

BURLINGTON, RICHARD BOYLE, EARL OF, an English architect, born April 25, 1692, died 1753. He studied architecture in Italy, but had no feeling for the Gothic. The porticoes of Inigo Jones and the structures of Palladio won his admiration, and on the principles which

these exhibited he erected many buildings, of which the best known are his own villas at Cheeswick and at Laneborough in Yorkshire, the front of Burlington house (lately purchased by government for scientific societies, &c.), the dormitory at Westminster school, mansions for several noblemen, his friends, the reparation of St. Paul's church, Covent garden (by Inigo Jones), and the assembly room at York, which is his best work. He was the friend of Pope, who eulogized him in his "Fourth Epistle."

BURMAH, or THE KINGDOM OF AVA, an extensive state in the S. E. of Asia, beyond the Ganges, formerly much larger than at present. Its former limits were between lat. 9° and 27° N., ranging upward of 1,000 miles in length, and over 600 in breadth. At present the Burmese territory reaches from lat. 19° 25' to 28° 15' N., and from long. 93° 2' to 100° 40' E.; comprising a space measuring 540 miles in length from N. to S., and 420 miles in breadth, and having an area of about 200,000 sq. m. It is bounded on the W. by the province of Aracan, surrendered to the British by the Burmese treaty of 1826, and by the petty states of Tiperah, Munnipoor, and Assam, from which countries it is separated by high mountain ridges; on the S. lies the newly acquired British province of Pegu, on the N. upper Assam and Thibet, and on the E. China. The population, according to Capt. Henry Yule, does not exceed 3,000,000.—Since the cession of Pegu to the British, Burmah has neither alluvial plains nor a seaboard, its southern frontier being at least 200 miles from the mouths of the Irrawaddy, and the country rising gradually from this frontier to the north. For about 300 miles it is elevated, and beyond that it is rugged and mountainous. This territory is watered by three great streams, the Irrawaddy, its tributary the Khyen-dwem, and the Salwin. These rivers have their sources in the northern chain of mountains, and run in a southerly course to the Indian ocean.—Though Burmah has been robbed of its most fertile territory, that which remains is far from unproductive. The forests abound in valuable timber, among which teak, used for ship building, holds a prominent place. Almost every description of timber known in India is found also in Burmah. Stick lac of excellent quality, and varnish used in the manufacture of lacquered ware, are produced. Ava, the capital, is supplied with superior teak from a forest at 15 days' distance. Agriculture and horticulture are everywhere in a remarkably backward state; and were it not for the wealth of the soil and the congeniality of the climate, the state would be very poor. Fruits are not cultivated at all, and the crops are managed with little skill. Of garden vegetables, the onion and the capsicum are the most generally cultivated. Yams and sweet potatoes are also found, together with inconsiderable quantities of melons, cucumbers, and egg-plants. The young shoots of bamboo, wild asparagus, and the succulent roots of various aquatic plants, supply to the

inhabitants the place of cultivated garden fruits. Mangoes, pineapples, oranges, custard-apples, the jack (a species of breadfruit), the papaw, fig, and the plantain (that greatest enemy of civilization), are the chief fruits, and all these grow with little or no care. The chief crops are rice (which is in some parts used as a circulating medium), maize, millet, wheat, various pulses, palms, sugar-cane, tobacco, cotton of short staple, and indigo. Sugar-cane is not generally cultivated, and the art of making sugar is scarcely known, although the plant has been long known to the people. A cheap, coarse sugar is obtained from the juice of the Palmyra palm, of which numerous groves are found, especially south of the capital. Indigo is so badly managed as to be entirely unfit for exportation. Rice in the south, and maize and millet in the north, are the standard crops. Sesamum is universally raised for cattle. On the northern hills the genuine tea-plant of China is cultivated to considerable extent; but, singularly, the natives, instead of steeping it, as they do the Chinese tea, eat the leaf prepared with oil and garlic. Cotton is raised chiefly in the dry lands of the upper provinces.—The dense forests of Burmah abound in wild animals, among which the chief are the elephant, the one-horned rhinoceros, the tiger and leopard, the wild hog, and several species of deer. Of birds, the wild cock is common; and there are also varieties of pheasants, partridges, and quails. The domestic animals are the ox, the horse, and the buffalo. The elephant also is used as a draught animal. The camel is not known. A few goats and sheep are found, but the breed is little cared for. Asses are also little used. Dogs are neglected in the Burmese economy, but cats are numerous. Horses are used exclusively for riding, and are rarely more than thirteen hands high. The ox is the beast of draught and burden in the north; the buffalo in the south.—Of minerals, gold, carried down in the sands of the mountains, is found in the beds of the various streams. Silver mines are wrought at Bor-twang, on the Chinese frontier. The amount of gold and silver obtained annually has been estimated to approach \$1,000,000. Iron is abundant in the eastern portion of Laos, but is so rudely wrought that from 80 to 40 per cent. of the metal is lost in the process of forging. The petroleum pits on the banks of the Irrawaddy produce 8,000,000 pounds per annum. Copper, tin, lead, and antimony are known to exist in the Laos country, but it is doubtful if any of these metals are obtained in considerable quantities, owing to the ignorance of the people of the methods of working ores. The mountains near the city of Ava furnish a superior quality of limestone; fine statuary marble is found 40 miles from the capital, on the banks of the Irrawaddy; amber exists so plentifully that it sells in Ava at the low price of \$1 per pound; and nitre, natron, salt, and coal are extensively diffused over the entire country, though the latter is little used. The

petroleum, which is produced in such abundance, is used by all classes in Burmah for burning in lamps, and as a protection against insects. It is dipped up in buckets from narrow wells sunk in a depth of from 210 to 300 feet; it bubbles up at the bottom like a living spring of water. Turpentine is found in various portions of the country, and is extensively exported to China. The oriental sapphire, ruby, topaz, and amethyst, beside varieties of the chrysoberyl and spinelle, are found in 2 districts in the beds of rivulets. All, over \$50 in value, are claimed by the crown, and sent to the treasury; and no strangers are allowed to search for the stones.—From what has been said, it is evident that the Burmese have made but little advance in the practice of the useful arts. Women carry on the whole process of the cotton manufacture, using a rude loom, and displaying cooperatively little ingenuity or skill. Porcelain is imported from China; British cottons are imported, and even in the interior undersell the native products; though the Burmese melt iron, steel is brought from Bengal; silks are manufactured at several places, but from raw Chinese silk; and while a very great variety of goods is imported, the exports are cooperatively insignificant, those to China, with which the Burmese carry on their most extensive commerce, consisting of raw cotton, ornamental feathers, chiefly of the blue jay, edible swallows' nests, ivory, rhinoceros and deer's horns, and some minor species of precious stones. In return for this, the Burmese import wrought copper, opium, quicksilver, vermilion, iron pans, brass wire, tin, lead, alum, silver, gold and gold leaf, earthenware, paints, carpets, rhubarb, tea, honey, raw silk, velvets, Chinese spirits, musk, verdigris, dried fruits, paper, fans, umbrellas, shoes, and wearing apparel. Gold and silver ornaments of a very rude description are made in various parts of the country; weapons, scissars, and carpenters' tools are manufactured at Ava; idols are sculptured in considerable quantities about 40 miles from Ava, where is found a hill of pure white marble. The currency is in a wretched condition. Lead, silver, and gold, all uncoined, form the circulating medium. A large portion of the commerce is carried on by way of barter, in consequence of the difficulties attending the making of small payments. The precious metals must be weighed and assayed at every change of hands, for which bankers charge about 2½ per cent. Interest ranges from 25 to 60 per cent. per annum. Petroleum is the most universal article of consumption. For it are exchanged saltpetre, lime, paper, lacquer ware, cotton and silk fabrics, iron and brass ware, sugar, tamarinds, &c. The yonnet-ul (the standard silver of the country) has generally an alloy of copper of 10 or 15 per cent. Below 75 the mixture does not pass current, that degree of fineness being required in the money paid for taxes.—The revenues of the empire proceed from a house tax, which is levied on the village, the village authorities afterward assessing householders according to

their respective ability to pay. This tax varies greatly, as from 6 tikals per household in Pramo to 27 tikals in Tonglo. Those subject to military duty, the farmers of the royal domain, and artificers employed on the public works, are exempt. The soil is taxed according to crops. The tobacco tax is paid in money; other crops pay 5 per cent. in kind. 100 farmers of the royal lands pay over one-half their crops. Fishing ports on lake and river are let either for a stated term or for a proportion of dried fish from the catch. These various revenues are collected by and for the use of the officers of the crown, each of whom receives, according to his importance, a district greater or less, from the proceeds of which he lives. The royal revenue is raised from the sale of monopolies of the crown, among which cotton is the chief. In the management of this monopoly, the inhabitants are forced to deliver certain articles at certain low prices to the crown officers, who sell them at an enormous advance. Thus, lead is delivered by the producers at the rate of 5 tikals per bis, or 360 lbs., and his majesty sells it at the rate of 30 tikals. The royal revenues amount, so it is stated, to about 1,850,000 tikals, or 2,257,500 per annum; to which must be added a further sum of £44,250, the produce of certain tolls levied in particular districts. These moneys keep the royal household. This system of taxation, though despotic, is singularly simple in its details; and a further exemplification of simplicity in government, is the manner in which the army is made to maintain itself, or, at least, to be supported by the people. The modes of enlistment are various; in some districts the volunteer system being adhered to, while in others, every 16 families are forced to furnish 2 men armed and equipped. They are further obliged to furnish to these recruits, monthly, 55 lbs. of rice and 5 rupees. In the province of Padoang every soldier is quartered upon 3 families, who receive 5 acres of tax-free land, and have to furnish the man of war with half the crops, and 25 rupees per annum, beside wood and other minor necessities. The captain of 50 men receives 10 tikals (the tical is worth \$1½, or 2½ rupees) each from 6 families, and half the crop of a 7th. The bo, or centurion, is maintained by the labor of 62 families, and the bo-gyi, or colonel, raises his salary from his own officers and men. The Burman soldier fights well under favoring circumstances, but the chief excellence of a Burman army corps lies in the absence of the *impedimenta*; the soldier carries his bed (a hammock) at one end of his musket, his kettle at the other, and his provisions (rice) in a cloth about his waist.—In physical conformation, the Burmese appear to be of the same race which inhabits the countries between Hindostan and China, having more of the Mongolian than of the Hindoo type. They are short, stout, well proportioned, fleshy, but active; with large cheek-bones, eyes obliquely placed, brown but never very dark

complexion, coarse, lank, black hair, abundant, and more beard than their neighbors, the Siamese. Major Allen, in a memoir to the East India government, gives them credit for frankness, a strong sense of the ridiculous, considerable readiness of resource, little patriotism, but much love of home and family; comparatively little prejudice against strangers, and a readiness to acquire the knowledge of new arts, if not attended with too much mental exertion. They are sharp traders, and have a good deal of a certain kind of enterprise; are temperate, but have small powers of endurance; have more cunning than courage; though not blood-thirsty by nature, have borne phlegmatically the cruelties of their various kings; and without being naturally liars and cheats, are yet great braggarts and treacherous.—The Burmese are Buddhists by faith, and have kept the ceremonies of their religion free from intermixture with other religions than elsewhere in India and China. The Burmese Buddhists avoid, to some extent, the picture worship practised in China, and their monks are more than usually faithful to their vows of poverty and celibacy. Toward the close of the last century, the Burman state religion was divided by 2 sects, or offshoots from the ancient faith. The first of these entertained a belief similar in some respects to pantheism, believing that the godhead is diffused over and through all the world and its creatures, but that it appears in its highest stages of development in the Buddhists themselves. The other rejects entirely the doctrine of the metempsychosis, and the picture worship and cloister system of the Buddhists; considers death as the portal to an everlasting happiness or misery, according to the conduct of the deceased, and worships one supreme and all-creating spirit (*Nat*). The present king, who is a zealous devotee to his faith, has already publicly burned 14 of these heretics, both parties of whom are alike outlawed. They are, nevertheless, according to Capt. Yule, very numerous, but worship in secret.—The early history of Burmah is but little known. The empire attained its acme of power in the 11th century, when the capital was in Pegu. About the beginning of the 16th century the state was split into several minor and independent governments, which made war upon each other; and in 1554, when the king Tshen-byoo Myayen took Ava, he had subdued to himself all the valley of the Irrawaddy, and had even subjected Siam. After various changes, Alompra, the founder of the present dynasty (who died in 1760), once more raised the empire to something like its former extent and power. Since then the British have taken from it its most fertile and valuable provinces.—The government of Burmah is a pure despotism, the king, one of whose titles is lord of life and death, dispensing imprisonment, fines, torture, or death, at his supreme will. The details of the government are carried out by the *hlwot-dau*, or council of state, whose presiding officer is the

pre-nominated heir-apparent to the throne, or if there is no heir named, then a prince of the blood royal. In ordinary times the council is composed of 4 ministers, who have, however, no distinct departments, but act wherever chance directs. They form also a high court of appeal, before whom suits are brought for final adjudication; and in their individual capacity, they have power to give judgment on cases which are not brought up to the collective council. As they retain 10 per cent. of the property in suit for the costs of the judgment, they derive very handsome incomes from this source. From this and other peculiarities of the Burmese government, it is easily seen that justice is rarely dealt out to the people. Every officeholder is at the same time a plunderer; the judges are venal, the police powerless, robbers and thieves abound, life and property are insecure, and every inducement to progress is wanting. Near the capital the power of the king is fearful and oppressive. It decreases with distance, so that in the more distant provinces the people pay but little heed to the behests of the lord of the white elephant, elect their own governors, who are ratified by the king, and pay but slight tribute to the government. Indeed, the provinces bordering on China display the curious spectacle of a people living contentedly under two governments, the Chinese and Burmese taking a like part in the ratification of the rulers of these localities, but, wisely, generally settling on the same men. Notwithstanding various British embassies have visited Burmah, and although missionary operations have been carried on there more successfully than elsewhere in Asia, the interior of Burmah is yet a complete *terra incognita*, on which modern geographers and map-makers have ventured some wild guesses, but concerning which they know very little in detail.—(See "Narrative of the Mission sent by the Governor-General of India, to the Court of Ava, 1855," by Capt. Henry Yule. London, 1858.)

BURMANN, the name of a Dutch family distinguished for learning.—FRANCISUS, born at Leyden in 1628, died in 1679, was the son of a Protestant minister who had been driven from France. He officiated as professor of theology, and became known to fame by his writings, especially by his commentaries on the Old Testament.—PETER, his eldest son, born at Utrecht, June 26, 1668, died in Leyden, March 31, 1741, studied under Gravius and Gronovius, received his diploma of doctor at law in 1688, travelled extensively abroad, gained distinction in the practice of his profession, and successively officiated as professor of eloquence, history, Greek, and politics, at Utrecht, and subsequently at Leyden, where he was twice rector of the university, and where he finally became professor of the history of the United Provinces and of poetry, and keeper of the university library. His editions of Latin classics and of the works of

George Burmann gained for him a great reputation among the learned men of his time. He published, also, treatises on Roman antiquities, and on the customs of the Roman people; a dissertation on the *Jupiter Fulguribus*, the epistles of Cælius and other scholars, and a more elaborate work of the same kind, entitled *Adepts Epistolæ* (Leyden, 6 vols., 1737), which is of great usefulness to classical scholars from the provision of literary exercises and critical dissertations. He was frequently engaged in controversies with many of the learned contemporaries, and in the preface to his edition of Laurent speaks of Bentley with a certain degree of bitterness. His life was written by Dr. Johnson, who says of him that "if reputation be estimated by usefulness, he may claim a higher degree in the ranks of learning than some others of happier education or more vigorous imagination." In the "Imagines," however, we find Burmann's name coupled with those of several other scholars against whom Pope's satire was directed.—Among the many other learned members of the same family the nephew of the preceding, PETER BURMAN, occupies the most conspicuous position. He was born in Amsterdam, Oct. 19, 1714, and died June 24, 1778. In 1743 he was appointed professor of eloquence, history, and poetry at Franeker, and in 1742 he was transferred to the Athenæum of Amsterdam, where he taught Greek in addition to the same branches of study, officiating at the same time as librarian and as visitor of the Latin schools. He inherited the controversial disposition and also the literary tastes of his uncle, and published editions of Virgil, Anæstasius, and other classic authors.

BURMANN, GUSTAV WILHELM, a German poet, born May 16, 1777, at Laufen, died Jan. 5, 1808, in Berlin. He is now chiefly remembered for his wonderful talent of improvisation. Upon any given theme he would for several hours deliver in verse a succession of excellent thoughts.

BURMEISTER, HENRICH, a German naturalist, born at Birsfeld in 1807. He studied medicine at Göttingen and Halle, and in 1830 went to Berlin to qualify himself to be a teacher of natural history. He was soon after appointed an instructor in the gymnasium at Göttingen, and while there published, in 1837, his "Manual of Natural History." In 1842 he became professor of zoology in the university of Halle, where he still remains one of the most popular teachers, extending his lectures beyond his particular province to geology and other branches of natural history. In 1851 and '53 he made a scientific journey to Brazil, of which he published an account in 1855. Besides numerous zoological publications, his more important works are a "History of Creation," and "Geological Pictures of the Earth and its Inhabitants."

BURNS, RICHARD, an English divine and law compiler, born near Winton, in Westmoreland, died at Oxford, in the same county, Nov. 29,

1789. His 3 most important works are his "Justice" and his "Neoloical Law." The former is a digest of the common and statute law of England for the guidance of magistrates and parish officers; the latter is a digest of English ecclesiastical law, for the use of clergymen and consistories.

BURNAP, GEORGE WESTCOTT, an American clergyman of the Unitarian denomination, born in Merrimack, N. H., in 1802. He was graduated at Harvard college in 1824, and from the same institution received the title of doctor of divinity in 1854. In 1827 he was ordained pastor of the 1st independent church in Rastrow, where he still remains. Dr. Burnap has been a voluminous writer, his publications being chiefly of a theological and controversial character. In 1833 he wrote a doctrinal work on the "Controversy between Unitarians and other Denominations of Christians." Since then he has published "Lectures to Young Men," "Lectures on the Sphere and Duties of Women," "Lectures on the History of Christianity," "Expository Lectures on the Principal Texts of the Bible which relate to the Doctrine of the Trinity," and various other works of theology, as well as numerous occasional addresses. Dr. Burnap has also contributed to Sparks's "American Biography" a life of Leonard Calvert, the first governor of Maryland. He is distinguished for his profound knowledge of the sacred Scriptures, and his writings, without ornate rhetoric, are pure in style, marked by logical accuracy and clear judgment.

BURNES, SIR ALEXANDER, British geographer and diplomatist, born at Montrose, Scotland, May 16, 1805, assassinated in Cabool, Nov. 2, 1841. At the age of 16 he joined the Indian army as cadet. He was appointed interpreter and translator, in Surat, from his proficiency in Hindostanee and Persian, Dec. 25, 1822. Disturbances having broken out in Cutch, his regiment was ordered there, and, in Nov. 1825, he was appointed Persian interpreter to the army for the invasion of Sindh. In 1829 he was appointed assistant in the political agent at Cutch. In 1830 he went to Lahore, the capital of the Punjab, ostensibly in charge of a present of horses from William IV. to Ranjeet Singh, but actually to obtain accurate knowledge of the geography of the India. He surveyed the mouth of the Indus and made a map of the lower part of its course. He immediately followed up this mission by an expedition into central Asia, under the special direction of Lord William Bentinck, then viceroy of India. A year was occupied on this tour through Sindh, Afghanistan, Cabool, Tartary, Bokhara, and Persia. He returned in England in Oct. 1833, and was warmly received by the East India directors and the board of control. He received £800 for the 1st edition of his "Travels in Bokhara." The geographical society voted him its gold medal and a premium of 50 guineas "for the navigation of the Indus, and a journey by Balkh and Bokhara across central Asia." The French

geographical society gave him its gold medal and a brilliant reception. William IV. specially thanked him for his services. On returning to India, in 1835, he undertook a mission to Hyderabad to prevent the necessity of a war with Sind, and succeeded. He obtained permission from the ameer to survey the Indus, and a pledge that the practice of robbing stranded vessels should cease. In 1836-'7 he was sent to Dost Mohammed, at Cabool, on a commercial mission; but, persuaded that this prince meditated treachery toward the Anglo-Indian government, remonstrated, was dismissed, and retired to Simla, whence, when it was resolved to replace Shah Shoojah on the throne of Cabool, he preceded the army, in charge of the commissariat, and while so employed received the announcement of his having obtained the honor of knighthood and the brevet rank of lieutenant-colonel. In Sept. 1839, on the restoration of Shah Shoojah, Sir Alexander Burnes was made political resident at Cabool, with a salary of £3,000 a year. In this capacity he continued until Nov. 2, 1841, when on the outbreak of the Cabool insurrection, he was murdered, with his brother Lieut. Charles Burnes, and others. After his death was published "Cabool," in which he gave a narrative of his journey to, and residence in, that city in the years 1836, '7, and '8.

BURNET, a central county of Texas, formed in 1852 from Travis, Williamson, and Bell counties, and having an area of about 950 sq. m. It has a hilly and, in some places, mountainous surface, about $\frac{1}{2}$ of which is occupied by a growth of oak, elm, and cedar. Marble is found in great abundance; beds of coal have been opened, and a few traces of gold have also been discovered. The staples are wheat and Indian corn. In 1857 there were 12,480 head of cattle, valued at \$62,000, and 1,227 horses, valued at \$53,100. The value of real estate was \$215,600, and the aggregate value of all taxable property, \$474,350. Capital, Hamilton. Pop. in 1856, 1,898, of whom 190 were slaves; slave pop. in 1857, 197.

BURNET, GILBERT, bishop of Salisbury, born in Edinburgh, Sept. 18, 1643, died in London, March 17, 1715. He took the degree of M. A. at Aberdeen before the age of 14, studied law for a short time, but at the age of 18 was licensed to preach. His sermons, from the first, were extempore. He declined a living, as being too young for such a charge. After visiting Oxford, Cambridge, and London, he travelled in the Low Countries and France. On his return, in 1665, he was made a fellow of the royal society, and soon after, accepting the living of Saltoun, in East Lothian, was ordained by the bishop of Edinburgh. He remained in Saltoun for several years, an active and useful parish priest, and drew up a statement of the abuses practised by the Scottish bishops, avowing the authorship, for doing which Archbishop Sharpe proposed excommunication and deprivation. This did not take place; the rest of the hier-

archy objected to such extreme measures. In 1669 Burnet was elected divinity professor at Glasgow, where he continued for 4 $\frac{1}{2}$ years, striving to steer a middle course between the 2 parties then contending for power. The Presbyterians feared that his moderation would lead to the promotion of episcopacy, and the Episcopalians believed that his aim was to exempt dissenters from their persecutions. In 1669 he published his first work, "A Modest and Free Conference between a Conformist and a Non-conformist." While compiling "Memoirs of the Dukes of Hamilton," from family archives at Glasgow (it was not published until 1676), he had occasion to visit London, where he is said to have refused a Scottish bishopric, on the plea of youth. On his return, in 1671, he married Lady Margaret Kennedy, daughter of the earl of Cassilis (a leader of the moderate party), and, on the day of their union, presented her with a deed securing the whole of her fortune to herself, in order to silence the imputation of having married a lady much older than himself from interested motives. In 1672 he published "A Vindication of the Authority, Constitution, and Laws of the Church," a treatise much at variance with his previous opinions, being so defensive of the doctrine of passive obedience that it was highly approved at court, and obtained for him the offer of a Scottish archbishopric, which he declined. In 1673 appeared his "Mystery of Iniquity Unveiled," and in the same year, while he was in London, he was made chaplain to Charles II., with whom, and also with the duke of York, he had several private interviews; but soon after his name was struck off the list of royal chaplains, because he opposed the arbitrary measures of the duke of Lauderdale. He resigned his Glasgow professorship, and removed to London, where he printed his "Truth of Religion Revealed," and was appointed preacher at the Rolls chapel, and lecturer at St. Clement's. In 1679, taking his stand with the Protestant party, he published the first volume of his "History of the Reformation," for which he received votes of thanks from both houses of parliament, and a request to complete it. The second volume appeared in 1681, when he also printed "An Account of the Life and Death of the Earl of Rochester," having attended that profligate nobleman at his own request. Dr. Johnson says: "It is a book the critic ought to read for its elegance, the philosopher for its argument, and the saint for its piety." In 1682 he published his "Life of Sir Matthew Hale," and some minor works, and wrote a private letter to Charles II., remonstrating with him on his public misgovernment and private licentiousness, and reminding him of the fate of his father. The king is said to have read the letter twice, and then thrown it in the fire, but ordered the bishopric of Chichester to be offered to the writer "if he would entirely come to his interest." Burnet declined; attended Lord William Russell on the scaffold in 1683; was dismissed from his

Rolle's preachings and St. Clement's heterodoxy, by order of the king; and, on the death of Charles II., early in 1683, retired to the continent? After visiting Paris he travelled through the south of France, Italy, Switzerland, and the north of Germany, to Holland, and subsequently published an account of his journey in a series of letters addressed to Mr. Boyle. Visiting the Hague, on the invitation of the prince and princess of Orange, in 1786, he so actively took part in the preparations for a change of rulers in England, that James II. ordered him to be presented for high treason, and demanded his person from the states-general; but without effect, as, by taking as his second wife a Dutch lady of great wealth, named Scott, he had previously acquired the rights of naturalization in Holland. This failing, James actually appropriated £3,000 to have him kidnapped. Burnet accompanied William to England, in 1688, as his chaplain, and was soon after made bishop of Salisbury. In the house of lords, Bishop Burnet declared himself to be in favor of moderate measures toward non-juring divines, and for the toleration of Protestant dissenters. He acted as chairman of the committee to whom the bill of rights was referred. In 1689 he preached the coronation sermon of William and Mary, "with all his wonted ability," says Macaulay, "and more than his wonted taste and judgment; his grave and eloquent discourse was polluted neither by adulation nor by malignity." Soon after his installation in Salisbury, he addressed to the clergy of his diocese a pastoral letter, in which was a paragraph capable of being taken as a declaration that the title of William and Mary to the crown might be grounded on the right of conquest. Three years afterward (Jan. 1693), it was moved in the house of commons, and, after 2 days' sharp debate, carried by a majority of 7 in a house of 499, that this pastoral letter be burned by the hands of the common hangman. Burnet made no complaint, and was generally pitied. He felt the insult deeply, and garrulous as he was in relating the most minute particulars concerning himself, has preserved a most significant silence, in the "History of his Own Times," as to this insurrection. In 1694 he preached the funeral sermon of Archbishop Tillotson; in 1698 he published "An Essay on the Character of Queen Mary;" in 1698, "A Vindication of Archbishop Tillotson." In 1698 he became tutor to the young duke of Gloucester, son of the princess Anne, and in the same year (having lost his second wife) married Mrs. Berkeley, a rich widow, the authoress of a "Method of Devotion." In 1699 appeared his celebrated "Exposition of the Thirty-nine Articles of the Church of England;" in 1710, his "Church Catechism Explained;" and in 1714, the third volume of his "History of the Reformation." The introduction to this volume had appeared separately in 1712, and was severely dealt with by Swift. Having lived to witness the accession of the house of Hanover

to the English throne, he died of a pleuritic fever at the age of 73. He left 3 sons, one of whom (Thomas, afterward one of the judges of the common pleas) published a biography of his father, prefixed to a "History of his Own Times, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace in the Reign of Queen Anne." This, the most remarkable of Bishop Burnet's numerous works was greatly ridiculed by Dean Swift, Arbuthnot, and Pope. "Memoirs of P. P. Clark of this Parish," by the latter, is now the best known of these epistles. Macaulay, in the second volume of his "History of England," has drawn the character of Burnet, vindicating his integrity and ability.

BURNET, JAMES, judge of the supreme court of Ohio, and one of the founders of Cincinnati, born at Newark, N. J., Feb. 22, 1770, died May 30, 1853. He graduated at Princeton in 1791, was admitted to the bar in 1796, immediately after which he removed to Cincinnati, then a village with less than 500 inhabitants. He was a member of the territorial government of Ohio from 1793 till the establishment of a state government in 1803. He retired from the practice of his profession in 1816, while holding a distinguished rank as a lawyer, and after having been several times elected to the state assembly. In 1821 he was appointed judge of the supreme court of Ohio, and was soon after chosen by the legislature of Kentucky a commissioner in adjust matters in dispute between that state and Virginia. It was chiefly through his influence that the congressional act of 1821 was passed granting relief to the people of the west for debts due to the national government for lands. In 1828 he was elected U. S. senator to fill the vacancy occasioned by the resignation of Gen. Harrison. Judge Burnet was an original member, and in many cases president, of the principal benevolent and scientific societies in Cincinnati, and was elected a member of the French academy of sciences upon recommendation of Lafayette. He published in 1847 an instructive volume of "Notes on the North-western Territories." The principal hotel of Cincinnati is called after him, the Burnet house.

BURNET, JAMES. See MONRODODS.

BURNET, JOHN, engraver, painter, and architect, born at Fisher-row, near Edinburgh, March 20, 1784. He learned etching and engraving during 7 years' apprenticeship to Mr. Robert Scott, of Edinburgh, and, together with the late Sir William Allan and the late Sir David Wilkie, was a student in drawing and painting at the trustees' academy, Edinburgh. In 1805 he went to London, where he engraved Wilkie's "Jov's Harp," "Blind Fiddler," "Rent Day," "Rabbit on the Wall," "Chelsea Pensioners Reading the Gazette of the Battle of Waterloo" (his largest and most elaborate work); "Letter of Introduction," "Death of Tippecanoe," and "Village School." Mr. Burnet also engraved plates from several

recent painters, from the Rembrandts in the national gallery, and from several of his own paintings. He has written several illustrated works and manuals for artists.

BURNET, THOMAS, an English writer, born at Croft, in Yorkshire, about 1685, died at the charterhouse, London, Sept. 7, 1715. As master of the charterhouse school, he was the first Englishman to beard James II. in his arrogation of the dispensing power. By the constitution of the charterhouse the pensioners must take certain oaths of allegiance and supremacy. James sent down a candidate, Andrew Popham, for election to the charity, accompanying his mandate with a dispensation from the usual oaths, Popham being a Roman Catholic. The candidate was introduced by Chancellor Jeffries, one of the governors. Burnet at once denied the king's dispensing power, and refused to receive Popham. In this he was supported by his patron the duke of Ormond. Jeffries stormed and blustered, but the candidate was rejected. After the revolution Burnet was made clerk of the closet to William III. on the recommendation of Archbishop Tillotson, whose pupil he had formerly been. He lost the court favor, and his hopes of preferment, by an essay in which he treated the Mosaic account of the fall as allegorical. His principal works were written in Latin, of which the "Sacred Theory of the Earth," once had a high reputation for erudition and imaginative power.

BURNETS CREEK, a tributary of the Wash, in the state of Indiana. It is near the scene of the battle of Tippecanoe, fought in Nov. 9, 1811.

BURNETT, JOHN, an English dissenting minister, born in Perth, Scotland, in 1790. He was apprenticed to the craft of shoemaking, which he abandoned before he had completed his apprenticeship, enlisting as a private soldier in an infantry regiment. Here he devoted his leisure to study during several years, and then occasionally preached to a small Independent congregation in Glasgow. His sermons attracted so much attention that crowds went to hear them, and a sufficient sum was subscribed to purchase his discharge from the army. He was placed in pastoral charge at Glasgow, where he continued for several years. About 1824 he accepted charge of a church in Cork, where his popularity increased. In 1827, when visiting London, he was drawn into a public discussion, which lasted several days, before fashionable audiences in the Argyle rooms, with Mr. Joseph O'Leary, a Catholic gentleman, also from Cork, respecting the tenets of the church of Rome. He received a call from an Independent congregation at Camberwell, in charge of which he still continues.

BURNETT, WALDO IRVING, M. D., an American naturalist and microscopist, born in Southborough, Mass., July 12, 1828, died in Boston, July 1, 1854. He inherited his love of nature from his father, and in early boyhood began his study of entomology, which he continued

through life. Unwilling to subject his father to any unnecessary expenses, he gave up the advantages of a collegiate education; possessed of great mental activity, he easily mastered the usual branches of knowledge, and was especially proficient in mathematics; at a later period he made himself familiar with the French, German, and Spanish languages. His father was a physician, and under his guidance he commenced the study of medicine, graduated in 1849, and soon after visited Europe, where his attention was given almost exclusively to natural history and microscopic observation. Pulmonary consumption now began its course, and the remainder of his life was spent in changing from place to place, to mitigate, if possible, his disease. During the last 5 years of this unsettled life, he accomplished an almost incredible amount of intellectual labor, the results of which may be found in the "Proceedings" and "Journal of the Boston Society of Natural History," in the "Memoirs of the American Academy of Arts and Sciences," in the "American Journal of Science," in the "Transactions of the American Medical Association for 1853," and in the "American Journal of Medical Science." Beside a great number of minor articles, the principal work of his life was the "Prize Essay," published by the medical association, on "The Cell, its Physiology, Pathology, and Philology, as deduced from Original Observations; to which is added its History and Criticism." He was engaged, to the end of his brief career, in translating from the German the "Comparative Anatomy of Siebold and Stannius."

BURNEY, DR. CHARLES, an English historian of music, born at Shrewsbury, April 7, 1726, died in London, April 15, 1815. At the age of 18 he came under the tuition of Dr. Arne, with whom he studied for 3 years in London. In 1749 he was appointed organist of a church in Fenchurch street, and in the same year produced at Drury lane 3 musical dramas, "Robin Hood," "Alfred," and "Queen Mah." For the next 9 years he lived at the town of Lynn Regis, in Norfolk, fulfilling the duties of organist, on a salary of £100, and compiling materials for his "History of Music." In 1760 he returned to London, where he brought out a number of instrumental compositions, and an adaptation of Jean Jacques Rousseau's operetta, *Le devin du village*. One of his most admired works was an elaborate anthem, performed on the occasion of receiving his degree of doctor of music at Oxford in 1769. In the following year, with a view of obtaining further materials for his "History of Music," he visited the principal cities of France and Italy, and in 1771 published the result of his observations in a volume entitled "The Present State of Music in France and Italy," which Dr. Johnson made the model of his "Tour to the Hebrides." In the succeeding year Dr. Burney made a similar tour through Germany and the Neth-

estimates, and published the result in 2 volumes. The 1st volume of his "History of Music" appeared in 1778, the 2d in 1782, and the 3d and 4th in 1789, the whole having occupied 20 years in meditation, and over 20 in writing and printing. Dr. Burney's scientific works are a notice of young Cowell, afterward distinguished as a musician; a life of Metastasio, and the musical articles in Ross's "Cyclopaedia." He was twice married, and had a family of 8 children, of whom the oldest created a sensation in London in her youth by her remarkable performances on the harpsichord. His 2d daughter was Madame D'Arbigny, the novelist.—CHAMBERLAIN, D.D., 2d son of the preceding, and a man of great learning, born at Lynn, in Norfolk, England, in 1707, died in 1817. He contributed to the "Monthly Review" many articles on classical literature. The profits of his literary labors were mostly expended in the formation of a library, which was purchased by the nation after his death, and now forms part of the library of the British museum.

BURNNEY, FRAYERS, See ARMY, MARRAGE of.

BURNING FLUID, a mixture of alcohol and camphens (the purified or spiritus turpentina), made with varying proportions of the ingredients, and called by various names, as well as by the general name of burning fluid. The object of the mixture is to produce an illuminating agent, in which the feeble blue light of the more hydrocarbon alcohol shall be brightened by the larger proportion of carbon introduced in the carbonyl, camphens. This, if burned alone, is apt to give a sooty flame from its excess of carbon. (See CAMPHENS.) By uniting them, any desirable proportion of carbon and hydrogen is obtained, and the flame resulting from their combustion is clear, yellow-colored, and exceedingly agreeable. The liquid also is clean in use, and free from the disagreeable qualities of the oils, so that it has become highly popular in common use for lamps, in spite of the terrible accidents which are every day occurring in consequence of the highly explosive nature of its vapor. This invisible vapor, as it escapes from the surface of the fluid, may be ignited by coming in contact with the flame of a lamp, or even with the red-hot surface of a stove. The effect is like that produced by carrying a light into a room in which gas has collected from a leak of the gas-pipe. The flame is instantly communicated through the air to the vessel containing the fluid, and this being scattered about every thing around is enveloped in fire. Burning fluid is thus seen to be a more dangerous substance to have in a house than gunpowder; for the latter produces no subtle vapor, that may be stealing through the air to explode on meeting a spark of fire; on the contrary, some highly heated body must be brought into actual contact with the feeble solid body to produce an explosion. Notwithstanding this, and the palpable fact that fires have been daily sacrificed for years

past, and still continue to be, in using this substance, no restrictions have been imposed by legislative bodies upon its free employment, and the sale of it to be introduced into families entirely ignorant of its dangerous qualities. And what, perhaps, is still more strange, those who are informed of its character, and know of the sad effects constantly resulting from its use, and who would look with horror upon a can of gunpowder kept in their houses, do not hesitate to introduce this into their families, to be daily handled by servants and children, careless and inconsiderate of its qualities. It is true that numerous ingenious devices have been contrived by which the risks of explosion are diminished. Modifications of Sir Humphrey Davy's safety lamp have been invented, which testify by their very precautions to the acuteness of the danger they are designed to guard against. Even the cans which contain the fluid that generates the explosive vapor are furnished like the lamps that burn it, and many feel secure and justified in continuing to employ the article thus protected. The ingenious lamp of Mr. Newell of Boston is constructed with a fixed cylinder of fine wire gauze, extending to the bottom of the cavity for the fluid. The gauze has 500 holes to the inch. A tube made of the same kind of gauze incloses the wick, and is secured by screwing into the top of the cylinder within which it is contained. The disk on the top of the wick tube is perforated with a number of small holes, to establish a communication between the external air and the cavity within the lamp. These are to allow of the escape of the vapor, if any should be suddenly produced on the surface of the fluid, which, if confined, might cause the lamp to burst. The can is provided with a gauze diaphragm in the spout and another under the lid. In case of accidental ignition while filling the lamp, the combustion cannot extend beyond the gauze; but if the gauze happens to meet with any injury, this may be entirely unsuspected, and the contrivance is then worse than useless. The lamp, too, if of glass, is liable to be broken by a fall or otherwise, and thus create an explosion. Where the lamps are indispensable, as in working coal mines, the atmosphere of which is liable at any moment to be filled with fire damp, such protections, imperfect as they must be, cannot be too highly prized; but when used only for the more agreeable light they give, or for an imaginary economy, they may be admired for their ingenuity, while we may lament this was not directed to meet the rest of the evil, and provide a harmless substitute for the fluid itself. It would seem that this ought to be obtained in benzole or some similar substance. An exceedingly ingenious improvement upon Newell's lamp has been invented by Mr. Solomon Andrews, of New York. This lamp is so contrived, that if thrown down and broken, the flame is extinguished before the vapor can reach it. A metallic tube passes from the burner down to the bottom of the fluid in the

lamp, and in this tube is what may be called a wick of silver wires, which serves the double purpose of conveying heat down the tube to volatilize a portion of the fluid, and also to raise the fluid up by capillary action toward the burner, near which it is, by the heat, converted into vapor, and thus passes through the burner like common gas. The burner is first heated by applying a flame to it, and the gas being once ignited, it continues to furnish, by its combustion, sufficient heat to keep up the supply. The lamp cannot be refilled without unscrewing the burner, which extinguishes the flame, and thus prevents an explosion from this common cause. By such ingenious contrivances the use of the material is probably rendered as nearly safe as its nature admits.

BURNING GLASS AND BURNING MIRROR, instruments to concentrate the sun's heat. The usual burning glass is simply a double convex lens, which brings the rays of solar heat to a focus at nearly the same point at which it brings the rays of light. Artificial heat cannot, in general, be brought to a focus by a glass lens; but a lens of rock salt will bring heat radiating from any source to a focus. The use of burning glasses, or burning crystal, is alluded to by Aristophanes, and several writers declare that Archimedes fired the Roman ships by means of burning mirrors. In the 17th and 18th centuries many experiments were made with burning glasses of immense size. Tschirnhausen made several, some of which are still at Paris, 33 inches in diameter. In 1774 Lavoisier and Brisson superintended the making of a lens 4 feet in diameter, of 2 glasses like watch crystals, with various fluids between. This is called Trudaine's lens, from the gentleman who bore the expense. About the year 1800, a Mr. Parker of London made a lens 8 feet in diameter, which is now at Pekin. The heat from these large lenses is intense, and capable of melting any stone or mineral in a few seconds. Equal effects may be obtained from mirrors. Heat is reflected like light, and a concave mirror brings both to a focus. About 1670 a M. Vilette of Lyons constructed several mirrors of polished metal, from 30 to 50 inches in diameter. Tschirnhausen made one of copper nearly 5 feet in diameter. Buffon (who was the first to suggest a lens made of several pieces, afterward brought to perfection by Fresnel, and of great use in lighthouses) made a large reflector of several hundred smaller ones, each 6 inches by 8. With this he set fire to wood at the distance of 210 feet, proving the possibility, though not the probability, of Archimedes having thus burned the Roman fleet. Within a few years, it having been shown that the sun's rays have a heating power partly proportioned to the heat of the place into which they shine, the galvanic flame of a large battery has been made to play through the focus of a large burning glass, and thus the most intense heat ever witnessed has been produced, beyond all reasonable comparison with those tempera-

tures that can be measured by degrees. In all these experiments the most blinding light accompanies the heat, which renders it somewhat difficult to observe the effects. Priestley's "History of Optics," Bossut's *Histoire des mathématiques*, the "Memoirs of the Paris Academy" for 1777, and Buffon's supplement to his "Natural History," will give further information to those who desire it.

BURNISHING, the last finish given to metallic articles, which consists in polishing by means of blunt instruments of steel, agate, copper, or a dog's tooth, rubbed over their surface. Vessels of round shape are turned in a lathe, and the burnishers are then conveniently applied to them; when of unsuitable form to be thus polished, the work is done by hand, and is very rapidly accomplished by an experienced workman, the tool quickly entering into the numerous interstices, and cleaning the surface of the metal of the slight film, of imperceptible thickness, which obscures its brightness.

BURNOUF, EUGÈNE, a French orientalist, born in Paris, Aug. 12, 1801, died there May 28, 1852. Shortly before his death he was appointed perpetual secretary of the academy of inscriptions, of which he had been a member since 1832. His principal work, *Introduction à l'histoire du Bouddhisme*, founded on the researches of Mr. B. H. Hodgson, was completed in 1844.

BURNS, ROBERT, the great national poet of Scotland, born Jan. 25, 1759, died July 21, 1796. A clay-built cottage, 2 miles south of the town of Ayr, and in the vicinity of the kirk of Alloway and the "auld brig o' Doon," was his birthplace. His parents were peasants of the poorest class, but honest, diligent, and respectable. They were eager for the moral and intellectual improvement of their offspring, and lost no opportunity for supplying them with the rudiments of education. Robert, in the interval of driving the plough, and other farm work, soon made himself a master of English. His chief reading books were the Bible, Mason's Collection of Prose and Verse, the "Life of Hannibal," and the history of Sir William Wallace. Later in life he attempted to learn French and Latin, without much success; but when the "Spectator," Shakespeare, Pope, and particularly the poems of Allan Ramsay, were put into his hands, he devoured them with avidity. His first attempt in verse, after the family had removed to Lochlea, was made toward his 16th year. "A bonnie, sweet, sonsie lass," as he says in a letter to Moore, "who was coupled with him in the labors of the hay-harvest," awoke his early inspiration; and thus he began, as he continued, his literary career in poetry and in love. Robert and his brother Gilbert were employed by their father, as regular day-laborers, at £7 per annum, until Robert's 19th year, when he went to the school of Kirkoswald, to learn mensuration and surveying. As it was situated on a smuggling coast, he fell in there with the bold characters of the contraband trade, which enlarged his knowledge of human nature, if it did

not improve his numbers. During this time he wrote and had printed the "Drops of Water," the "Death of Poor Mallic," "Mullin's Glory," and "John Barleycorn," in which he discovered that deep fountain of pathos and humor which afterward rendered him famous. In 1791-'2 he removed to Irvine to learn the trade of Stationer, in which, however, he did not make much progress, while he fell in with a kind of society not at all advantageous to his morals. He had always been an admirer of women, and his intercourse with them was of the most irreproachable kind, until at Irvine he was furnished with the subject of the "Epistle to John Rankin," for which volume, according to the custom of Scotland, he was compelled to do penance in church, before the congregation. It would appear from the two poems written on the same occasion, "The Poet's Welcome," &c., and "The evening dirge the daddie o't," that the poet rather gloried in his shame than repented of it. A short time before the death of his father, 1788, whose thickening misfortunes cast a gloom over the whole family, he and his brother took a farm at Mossgiel, with a view of providing shelter for their parents; but a life of the most labor and incessant economy was scarcely able to keep their heads above water. In the midst of his distress, he did not neglect the muse, and several satirical pieces, such as the "Holy Tullies," not contained in the common edition of his works, "Holy Willie's Prayer," the "Ordnation," the "Holy Fair," and others, chiefly levelled at the churchmen, won him a wide local reputation. But he showed himself capable of better things than these, and to his residence at Mossgiel are to be referred the verses to a "Moss," to a "Mountain Daisy," "Man was made to morn," and that sweetest of pastorals, the "Cotter's Saturday Night;" besides innumerable love songs, some of them the finest in the language, none of which, he says, related to imaginary business. His want of success in the farm put him upon the project of going to Jamaica in the West Indies, and in order to help himself to a part of the expense, he proposed to publish a collection of his writings. An irregular love-connection, which he desired to consummate by marriage, contributed, no doubt, to the formation of this resolve. Accordingly, in the autumn of 1786, he leased 600 copies of his poems at Kilmarnock, from which he derived assistance enough (£20) to enable him to purchase a passage in a ship about to sail from the Clyde. He was then "skulking from covert to covert," as he says, "to hide from the mercenary pack of the law," which the relatives of the mother of his children set upon his heels. His steer was on the road to Greenock, and he had written "The gloomy night is gathering fast," as a kind of farewell to Scotland, when a letter from Dr. Hiscloock to a friend of his arrested the execution of his purpose. This letter recommended a visit to Edinburgh, with a view to resolve the applicants which his poems had excited, and to arrange for the lease of a

new edition. Burns went to the metropolis, and for near three a year was harassed, crowded, fated, and fettered, by persons of all ranks, and particularly by those of eminence and distinction, as few men before him ever had been. He retired to his home, with the sum of £200 in his pocket, the remainder the new publication. Nearly the half of this he gave to his brother, for the farm at Mossgiel, and the residue he applied to stocking a new farm for himself at Edinburgh in Dumfriesshire. There, in 1788, he married Jane Armour, with whom he had previously formed a union. At the same time he became an officer of excise in the district in which he lived, and between his farm, his office, and an occasional poem, he managed to shake out a poverty-stricken and miserable existence. His salary was £50 a year, afterward increased to £70; but the duties of the place, together with his convivial habits, interfered so much with the labor of the farm, that the latter yielded him little or nothing, and he was compelled to surrender it to the landlord. A hand-to-hand grapple with poverty and care was thenceforth his gloomy fate. Toward the close of the year 1791, he retired to a small house in the town of Dumfries, where he supported himself and his family on his official stipend, and by random contributions to Johnson's "Museum," and Thomson's "Collection of Original Scottish Airs." But his habits of intoxication, ill health, and disappointment as to his prospects of promotion, soon undermined his constitution, and in his 37th year he died. During his illness, in which he consorted himself with a rascally and noble resignation, his good humor never deserting him in the darkest hours, it is said that his humble home was like a place besieged. The anxiety in regard to him, not of the mechanics and peasants only, but of the rich and learned, exceeds all belief. Whenever two or three persons met in the streets, their talk was of Burns, and of him alone. They spoke of his history, of his works, of his person, of his poems, and of his native and approaching fate; but all this was a sympathy which came too late. His funeral was a public one, attended by vast multitudes, from all parts of the country. During the excitement, there was some talk of raising a monument to his memory, but the purpose was not fulfilled till the year 1816. He left 4 sons, 2 of whom entered the East India company's service; but all of them are now dead.—The poetry of Burns will live forever, because it sprung directly out of the human heart, to the deepest and noblest emotions of which it appeals. Without evidences of culture, without that grand or powerful imagination which makes a Shakespeare or a Milton, aspiring only to the humblest flights of poetic art, it is yet so profoundly fraught with passion, so instinct with melody, so true to nature, so artless in its grace, that every bosom capable of feeling must be touched either by its pathos, its beauty, or its mirth. He had "an inspiration for every fancy, a music for every

mood." In the simple, the naïve, the sweet, he is scarcely more distinguished than he is in the grotesque, the wild, and even the terrible. His "Tam O' Shanter" displays a narrative ability of the first order, while his "Jolly Beggars" is filled with dramatic power. But his peculiar strength was the lyrical, and his songs, infinite in number as they are matchless in emotional gush and tenderness, will be the delight of the human heart so long as the warm blood rushes through it, or the tongue is able to articulate. The American poet Halleck has done the amplest justice to the genius of Burns of any of his kindred, and but reechoes the universal judgment of criticism, when he says:

There have been loftier themes than his,
And longer serolls, and louder lyres,
And lays lit up with poesy's
Purer and hollower fires;
Yet read the names that know not death,
Few nobler ones than Burns are there,
And few have won a greener wreath
Than that which binds his hair.

As a man, Burns was generous to a fault; independent and scorning meanness; exquisitely entertaining in conversation; and, though at times wild and reckless, with a deep and mighty undercurrent of religious feeling in his soul.—ROBERT, son of the foregoing, born at Mauchline, county of Ayr, Scotland, in Sept. 1786, died in Dumfries, May 14, 1857. He was an accomplished scholar, an enthusiastic student of the Gaelic language, a proficient in music, and of some poetical ability.

BURNS AND SCALDS. Burns are produced by heated solids, or by the flames of some combustible substance, solid, liquid, or gaseous; scalds are produced by heated steam or liquid. The worst burns which occur commonly arise from the explosion of gunpowder or inflammable gases, or from the dresses of children or of females catching fire; the worst scalds, from accidents in breweries, manufactories, laboratories, and steamboats. The severity of the accident depends mainly on the intensity of the heat of the burning body, together with the extent of surface and the vitality of the parts involved in the injury. The immediate effect of scalds is generally less violent than that of burns. Fluids, not being capable of acquiring so high a degree of temperature as some solids, cannot act with the same violence on a given point; but, flowing about with great facility, their effects often become more serious by extending to a very large surface of the body. A burn which utterly and instantaneously destroys the part it touches may be free from dangerous complications if the injured part be circumscribed within a small compass; while a scald apparently much less severe in its immediate effects, being more or less diffused, is always attended with different degrees of injury in different parts of its course, and may be very serious in its results, although apparently less violent in its first effects on any given part. The extent of the surface involved, the depth of the injury, the vitality and the

sensibility of the parts affected, must all be duly weighed in estimating the severity and the danger of an accident in any given case of burn or scald. In ordinary burns and scalds the immediate seat of injury is the skin or the external surface, one of the most vital parts of the frame. The skin is a highly organized membrane, endowed with the most acute sensibility. Burns and scalds, therefore, are more dangerous in proportion to the amount of surface involved than in proportion to the depths attained in a limited extent, for the outer layers are the most highly organized and sensitive parts of the cutaneous system. The outermost of all, however, being a mere coat of horny varnish, is the least sensitive; and where the injury is slight and altogether superficial, though extensive, the mischief is but trifling at first, and may be easily remedied, although unpleasant complications may ensue if the superficial injury is neglected, and the parts beneath are long exposed to the action of the air, which causes irritation, pain, and inflammation. The physiological obstruction long continued, and the shock to the whole nervous system, being more than the vital forces of the organism can withstand, no treatment can prevent a fatal termination to the sufferings of the patient in cases of excessively severe burns and scalds; but the worst cases might often be avoided by a little knowledge and self-possession on the part of the sufferer at the time of the accident, and a fatal contingency be transformed into a temporary injury. Everybody should, therefore, have some knowledge of the best course to pursue in case of such an accident happening either to themselves or to others near them at the time.—Where the body is enveloped in flames, from the clothes being on fire, the first thing to be done is to lie down on the floor and roll the carpet or a rug, or any cloth or garment, closely round the body, so as to exclude the air from the burning dress, and thus put out the flame. Or, lie down at once and roll the body over the burning clothes, calling to some one near to throw a blanket or a cloth of any sort, wet or dry, or water, over you as you lie on the floor, stifling the burning clothes between your body and the ground. And if the clothes of a child or a grown person near you should take fire, pursue the same method. The upright position is the worst, being favorable to the spread of the flames, and allowing them to reach the upper and most vital portions of the body, trunk, head, face, and neck. Fright causes children to run screaming to and fro for help, and this increases the currents of surrounding air, and helps the flame to spread more rapidly. The body should be quickly enveloped closely, in a wet or a dry garment or a blanket, a curtain, or table cloth, or any thing which may be at hand; the main thing being to extinguish the flames by shutting out the air, which gives them life, and without which they cannot be. There is no danger in the operation, because the moment the flames

are enveloped and the air is shut out, the fire is extinguished; the hottest and most rapid action therefore is the best, the most prudent, and least dangerous to all the parties concerned. Mandy dragging the child rapidly and closely to your arms, and rolling slowly on the floor with it, enveloping the burning part with any portion of your own dress, will stifle out the air and thus together. Pressure of mind alone suffices. In every case, and under all conditions, the main thing to be done at first is to stifle the flames by shutting out the air. Wrapping up the body in any thing, and lying on the floor, are the two things to be first thought of.—When the accident has happened, the burned or scalded parts should be immersed at once in cold water, or enveloped in wet cloths, or in dry cotton, or in flour, bran, or oiled calico, or any thing which is convenient to keep out the air, from the injured surface of the skin. Immersion in cold water is the best, where it is practicable; because it not only shuts off the air but causes a rapid rush of temperature from the injured tissues to the cold water, analogous to the violent rush of heat from the burning or scalding medium to the skin in the first instance, though in an opposite direction; and this inverse reaction soothes the nerves of sense, and thus answers the first requirement by diminishing the shock in the whole system from intensity of pain.—Some persons recommend stimulating fomentations of brandy or spirits of wine, oil of turpentine, or vinegar, kept on the injured parts by means of lint, cotton, or old flax soaked in the liquid; others prefer soap and water, with or without crocus; and much difference of opinion exists with regard to the best means. An oil-skin, a soapy film, a coat of simple ointment, or of cotton-wool, or flour, or any thing which will exclude the air and not irritate the injured parts, will serve the purpose very well; and all the theories about peculiar modes of action in the various stimulating substances, are more or less, it would appear, imaginary adjuncts to the simple fact of keeping out the air. When the pain has been arrested by the action of cold water, a delicate soap-and-water film upon the injured parts, surrounded by an oil-skin, or a layer of cotton-wool, and bandaged carefully, to keep the application in its place, are all that is required in ordinary cases of burns and scalds, until medical assistance be procured to treat the constitutional disturbances and take charge of the patient.

BURNT ISLAND, commonly pronounced *Brest Island*, a parliamentary borough, seaport town, and parish of Scotland, on the frith of Forth. The town is clean, well built, and has the best harbor on the frith, a lighthouse, and a dry dock. It is the steamboat ferry station on the passage of the Edinburgh and northern railway. The inhabitants are chiefly occupied in distilling, and in the fisheries.

BURNYKAT, JAMES, one of the earliest preachers of the society of Friends, born at Crabbinstock, Cumberland, in 1681, died in Dublin,

July 11, 1820. He travelled in England and Ireland, and in 1679 he came with George Fox to America. In his "Memoirs" much may be gathered of the actual condition of Maryland and other colonies, through which he passed from New England to North Carolina. He was a zealous advocate of the creed of the society of Friends, and bravely bore the many persecutions to which he was subjected.

BULL, AARON, an American politician, and 2d vice-president of the United States, born at Newark, N. J., Feb. 9, 1756, died in States Island, Sept. 14, 1835. He was of German extraction, and the son of the Rev. Aaron Burr; his mother was a daughter of Jonathan Edwards, the eminent theologian. Before he was 2 years old his parents died, leaving him a considerable estate. He entered the sophomore class of Princeton college in 1769, and graduated in 1772. At the outbreak of the revolution, Burr enlisted as a private, and joined the force before Boston. He volunteered for the expedition against Canada, and accompanied Arnold upon his troublesome march through Maine. He took part in the attack upon Quebec, and is said to have stood beside Gen. Montcalm when he was killed. For his conduct in the Canadian campaign, Burr was raised to the rank of major, and invited to join the family of Gen. Washington. Some event soon occurred, the precise character of which is not known, which compelled Burr to leave headquarters, and produced in the mind of Washington an impression against him which was never removed. As aide-de-camp to Gen. Putnam, Burr was engaged in the defence of New York, and shortly after (1777) was promoted to a lieutenant-colonelcy, with the command of his regiment, the colonel being a civilian. He was in the camp at Valley Forge, and distinguished himself at the battle of Monmouth, where he commanded a brigade in Lord Stirling's division. During the winter of 1778 and 1779 he was stationed upon the lines in Westchester county, N. Y.; early in the following spring he resigned his commission. He was led to take this step partly by ill health, but still more, it is supposed, by disappointment at not being more rapidly promoted. Burr belonged to the Lee and Gates faction; he always affected to despise the military talents of Gen. Washington; and it is not improbable that these circumstances interfered with his professional career. In 1783 Burr was admitted to the bar at Albany, and in July of the same year he married Mrs. Prevost, the widow of a British officer who had died in the West Indies. In 1783 he entered upon the practice of his profession in the city of New York, and soon obtained a lucrative business.—In politics, Burr's success was rapid and brilliant. In 1784 he was elected to the state legislature; he was appointed attorney-general of New York in 1789, and United States senator in 1791. While in the senate, several influential members of congress recommended him for the mission to France, but Washington, with marked emphasis, refused

cellor, as second in command, in his voyage to discover a north-east passage in 1553. Three years later he had chief command of another expedition, equipped with the same object. He doubled Cape North, touched at Nova Zembla, discovered the island Waigatz, and reached lat. 70° 30' N., a higher point than had before been reached by any navigator. He then turned to the east, designing to explore the river Obi; but the ice, the length of the nights, and the severe cold, obliged him to give up his purpose. He returned to England, and published an account of his observations. He was the first who observed the gradual declination of the magnetic needle.

BURROWS, WILLIAM, a lieutenant in the U. S. navy, entered the service in Jan. 1800, and though a man of great eccentricity of character, was always distinguished for his gallantry and high bearing as an officer. On Sept. 14, 1813, while in command of the *Enterprise* brig of 14 18-pound carronades, he fell in with, and captured, off Portland, Me., H. B. M. brig *Boxer*, of 12 guns, after a most gallant action. An awkward circumstance occurred to the enemy on this occasion. After he had hailed to say that he had surrendered, he added that his colors could not be struck until the *Enterprise* ceased her fire, as they were "nailed aloft." Both commanders were killed in this action. The *Enterprise* took her prize into Portland, where these 2 gallant officers were buried side by side with the honors of war. Lieut. Burrows fell at the age of 30.

BURSCHENSCHAFTEN (from *Bursche*, a youth, a student), German students' secret associations, founded in 1815 by that portion of the students of Jena who had taken a part in the German war of independence. The object of the association was to regulate the social habits of the students, and to foster a spirit of nationality. Tübingen, Heidelberg, Halle, and Gießen followed the example in 1816-'17. The German war of independence, which had principally brought about this fermentation among the students, not having produced those political reforms which they had anticipated, the students or *Burschen* of Jena resolved to convoke a general *Burschenschaft*, the object of which should be to connect the scattered associations into one national band of brotherhood, by the annual election of a presiding committee. On Oct. 18, 1817, representatives of almost all German universities met accordingly at the Wartburg festival, and in Oct. 1818, the members of 14 universities again assembled, and adopted a constitution, to which all the universities gave their assent in April, 1819, with the exception of Göttingen, Landshut, and those of Austria. Among the members of the Jena *Burschenschaft* was the student Sand, who had taken a prominent part in the convocation of the students at the Wartburg. When the dramatist Kotzebue was assassinated by Sand, on account of his opposition to the *Burschenschaften*, the German princes became alarmed,

and on Sept. 20, 1819, a conference took place at Carlsbad, which decreed the suppression of the associations. The students, however, baffled the designs of the government. The only change which the interdiction wrought was to make the *Burschenschaften* meet in secret instead of in public as before, and the secrecy, far from hindering their object, only tended to forward it. In 1827 the original project of a German national *Burschenschaft* was taken up again, but internal dissensions defeated the success of the plan. Two parties formed themselves, the *Germanen*, who were practical politicians and determined reformers, and the *Arminen*, composed of more ideal patriots, who saw not so much good in violent political changes, as in the general development of national power by perfecting their own individual moral and mental nature. In 1827, at Bamberg, and in Sept. 1831, at Frankfort, the 2 conflicting parties came together, and the *Arminen*, although in a numerical majority, succumbed to the more energetic *Germanen*. At a general meeting which took place at Tübingen, Dec. 25, 1832, a revolution was openly resolved upon, and the students were all invited to stand by the national German *Burschenschaft*, which had taken up its head-quarters at Frankfort-on-the-Main. This declaration was followed by the revolutionary attempt at Frankfort, in June, 1833, in which 1,867 students were implicated, and which led to the arrest of students all over Germany. Although the police measures for the suppression of the secret political societies have since been stringent, the *Burschenschaften* exist to this day, though under different names. During the revolution of 1848, the only students who became implicated, happened to be those of Vienna, who had never before joined the *Burschenschaften*.

BURSLEM, a parish and market town of Staffordshire, England. It is the principal town in the important district called "The Potteries," on the Birmingham and Liverpool railway, and contains a number of large factories, dwelling-houses, villas, churches, and several public buildings. Even in the 17th century it was the chief place in England for the production of earthenwares, at first of a rude and homely kind, but afterward brought to great perfection by Josiah Wedgwood, who was born at Burslem in 1730. Pop. in 1851, 15,984.

BURTON, ASA, an American divine, born at Preston, now Griswold, Conn., in 1752, died at Thetford, Vt., April 23, 1836. He graduated at Dartmouth college in 1777, and was ordained at Thetford in 1779 over a church of 16 members, to which during the more than half century of his pastorate there were admitted 490 members. In theology he maintained what was termed the taste scheme, in opposition to the exercise scheme of Emmons. He published a volume of essays, and several sermons and discourses.

BURTON, JOHN HILL, a Scottish author, born in 1807, assisted Dr. (now Sir John) Bowring

in preparing the collected edition of Jeremy Bentham's works, particularly supplying the "Introduction." He subsequently published the "Life and Correspondence of David Hume;" "Letters addressed to David Hume by Edmund Burke;" "Political and Social Economy;" "Narratives from Criminal Trials in Scotland;" "History of Scotland, from the Revolution to the Extinction of the Jacobite Insurrection," (1688 to 1746), &c. In 1804 he was appointed secretary to the prison board of Scotland.

BURTON, Buzzer, an English divine and author, born at Lindley, in Leicestershire, Feb. 8, 1676; died in Oxford, Jan. 25, 1689, about the time which, having cast his own nativity, he had himself predicted. His family were ancient and wealthy. In 1693 he went to the university of Oxford, and was elected student of Christchurch in 1696. Anthony Wood stated that "for form's sake, though he wanted not a tutor," he was put under the tuition of Dr. Baucroft. Having taken orders, he obtained a college living, and in 1698 was presented by Lord Berkeley to the rectory of Scraggy in Leicestershire. He composed the "Anatomy of Melancholy" in order, it is said, to distract his own mind from morbid reflections. This book went through 5 editions in its author's lifetime, and has repeatedly been reprinted since. Sterne seems to have used it almost as a commonplace book. Archbishop Herring describes it as "the pleasantest, the most learned, and the most full of sterling sense" among books, adding that the wife of the reigns of Anne and the first George were deeply indebted to it. Dr. Johnson said it was the only book that ever took him out of bed two hours sooner than he wished to rise. Wartus, Ferris, and Stevens strongly eulogized it. Byron said, "It is the most amusing and instructive medley of quotations and classical anecdotes I ever perused. If the reader has patience to go through his volumes, he will be more improved for literary conversation than by the perusal of any twenty other works with which I am acquainted." This curious and rambling book was published in 1621. Mr. Burton left his books to be divided between the Bodleian and the Christchurch library. The collection, which was large, is said to have comprised every book, no matter what the subject, published in his time. He also left £100 to each library to purchase books. He was addicted to astrology.

BURTON, WILLIAM BYASS, an English comedian and author, resident in America since 1804; born in London, in 1804. Intended for the church, he received a classical education, but at the age of 18 assumed the direction of his father's printing office, and edited a monthly magazine. His success as an amateur performer led him to become an actor, and after several years of experience in the Norwich circuit, he appeared with success at the Haymarket in 1832. He wrote several dramatic pieces, one of which, "Ellen Warcham," was played on 6

theatres in London on the same evening. Since coming to America he has been the lessee of theatres in the chief Atlantic cities, but has resided principally in Philadelphia and New York. In Philadelphia he erected, at his own cost, the national theatre, and started in 1837 the "Globe-man's Magazine." He was proprietor of the opera-house in New York, when it was burned in 1841. In 1847 he purchased Palmo's opera-house in Chambers street, where he managed dramatic performances with popular favor for nearly 10 years. In 1856 he purchased the Metropolitan theatre on Broadway, to which his name is now attached. As an actor he excels in a wide range of eccentric and comic parts. The comedy of the "Serious Family," in which he impersonates the character of Ammadab Slack, after having been played nightly for one whole season, is often revived by him. Of many of the humorous characters in Shakespeare he has made felicitous delineations, and he possesses a very full Shakespearean library. He edited for several years the "Literary Souvenir," and compiled in 1856 a "Cyclopedia of Wit and Humor," 2 vols. royal 8vo.

BURTON-UPON-TRENT, a market town of Staffordshire, Eng., 22 miles E. of Stafford, in a parish of its own name, which lies partly in Staffordshire and partly in Derbyshire. Pop. in 1851, 7,994. It is situated in a pleasant vale on the left bank of the Trent, which is navigable to this point by barges, and is here crossed by a freestone bridge of 26 arches, supposed to have been built about the time of the conquest, and remarkable as one of the longest structures of the kind in England, being 1,545 feet in length. The streets are well paved, and lighted with gas. Good water is abundant. There are 3 handsome churches, chapels belonging to various dissenting congregations, a free grammar school for boys, founded by the abbot of Burton in 1520, and enjoying from endowment an income of about £400 per annum, several other schools, a library and news-room, almshouses, a union workhouse, a dispensary, and a savings bank. Burton was formerly noted for alabaster works, but its chief production now is the excellent ale to which it gives its name, and which is consumed in large quantities in Europe, in America, and even in Asia. The other branches of industry are melting, tanning, rope making, iron forging, and the manufacture of cotton and hats. There are fairs 6 times a year, and a weekly market on Thursday. The Birmingham and Derby junction railway has a station half a mile W. of the town, and a branch of the Grand Trunk (or Trent and Mersey) canal joins the Trent about 1 mile below.—The abbey of Burton, some remains of which are yet visible, was founded about 1002 by an earl of Mercia, and subsequently received charters and privileges from the crown. Some of the abbots sat in parliament. Henry VIII., on the suppression of the monasteries, granted part of the possessions of this abbey, including the town and

several hamlets, to an ancestor of the marquis of Anglesey, the present lord of the manor, who thence derives the right of appointing a high steward, deputy steward, and bailiff, for the government of the town. The bailiff acts as justice of the peace, head of police, and coroner, and has the general regulation of the town, except as to paving and lighting, which are managed by a board of commissioners. During the contest between Edward II. and his barons, in 1322, the insurgents, led by the earl of Lancaster, took possession of this place, and for 8 days defended the bridge against the royalists. The latter finally crossed by a ford, and Lancaster, having set fire to the town (March 10), retreated into Yorkshire.

BURTSCHIED, or BORTCHT, a town of Rhenish Prussia, is almost a continuation of the city of Aix la Chapelle. It has 6,050 inhabitants, and contains several manufactories, beside some celebrated sulphur springs and baths, whose temperature is from 106° to 155° F.

BURWHA, a negro town in the kingdom of Bornoo, central Africa. It is situated on Lake Tchad, and covers an extent equal to 3 sq. m. Being defended by a wall 13 or 14 feet high, and surrounded by a dry ditch, it may be considered, with reference to the military practices of that country, a place of some strength. Pop. 5,000 or 6,000.

BURY, a parish, parliamentary borough, and manufacturing town of England, county of Lancaster, between the Roche and the Irwell, 198 miles N. W. of London, by the north-western railway, and 8 miles N. W. of Manchester, with which city it communicates by railway and canal. Pop. of borough in 1851, 31,262. It is an ancient town, but its importance, as well as its neat appearance, is of modern date. Since 1846 the streets have been paved and widened, gas and water introduced, sewers constructed, and many handsome buildings erected. The principal edifices are the parish church, with a beautiful tower and spire, 8 other churches, several chapels, 3 newsrooms, a mechanics' institution, 8 libraries, a model barrack, and a savings bank. There are many excellent schools, including a free grammar-school, founded by the Rev. Roger Kay in 1776, and having an income from endowment of £430 per annum. It has 2 exhibitions of from £30 to £35 each, to the colleges of St. John's, Cambridge, and Brazenose, Oxford. The manufacture of woollen was a prominent branch of industry here in the reign of Edward III., but has now given way in great degree to that of cotton, which is extensively prosecuted in all its branches. Several important improvements in the manufacture originated here, and among others that of employing various colors in weaving one piece of cloth. The first Sir Robert Peel established his extensive print works on the Irwell, near this town; and at his residence, Chamber hall, in the immediate vicinity, his son, the celebrated statesman, was born. Bury

also contains several bleaching and dyeing establishments, paper mills, logwood-grinding mills, and iron foundries. It is governed by the county magistrates, who hold petty sessions twice a week. The Liverpool, Bolton, Wigan, and Bury, and the East Lancashire railways, pass through it. There are extensive coal mines in the vicinity.

BURY, HENRI BLAZZ, baron de, a French author and critic, born at Avignon, May 19, 1818. He made his first literary venture with a poem entitled *Le souper chez le commandeur*, published in 1839 in the *Revue des deux mondes*. To that periodical he contributed for many years upon political and social questions. He wrote for it also many poems and critical essays upon Germany and its literature, some of them under the pseudonym of Hans Werner. He published a complete translation of Faust in 1844, which has passed through numerous editions. He soon after published an essay, entitled *Ecrivains et poètes d'Allemagne*. He resided for several years in Germany, and was intimate in the famous literary society of Weimar. He afterward travelled in Italy, and in 1850 published a political essay, *Sur Vérone et l'Italie pendant les campagnes de Radetzky*; and he was the first to suggest a union of the 2 branches of the house of Bourbon.—His wife, MARIE PAULINE ROSE STUART, of an ancient Scotch family, was educated in France, and has written many tales and critical essays both in English and French. Among these are the *Essai sur Lord Byron*, and the novels "Mildred Vernon," and "Falkenberg."

BURY ST. EDMUND'S, a parliamentary and municipal borough and market town of England, in the county of Suffolk, on the Lark, 26 miles N. W. of Ipswich, and 94 miles N. E. of London by railway, and 72 miles by road. Pop. in 1851, 13,900. It is well built, supplied with gas and water, and has clean, paved, and regular streets. It comprises 2 wards, is governed by a mayor, 6 aldermen, and 18 councillors, and is the seat of the county assizes, general, quarter, and petty sessions, and other courts. Its public buildings and institutions are numerous and interesting. It has 3 handsome churches, one of which, built about 1430, and remarkable for its beautiful carved roof, contains a marble slab erected to the memory of Mary, queen of France, and afterward duchess of Suffolk, daughter of Henry VII. of England. Another of the churches has a belfry 80 feet high, which was originally a grand portal to the churchyard, and is regarded as one of the finest specimens of its class of ancient Norman architecture in existence. The Roman Catholics, and various dissenting denominations, have chapels. Schools are numerous, and some of them of high repute. Among the latter are a free grammar-school, founded by Edward VI., and having an income from endowment of more than £600 a year, a commercial school for 150 boys, national schools, &c. Of nearly 100 almshouses and similar institutions in Bury, the

most celebrated is Clopton's hospital for decayed housekeepers. A mechanics' institution, a library, shire-hall, guildhall, theatre, concert and assembly rooms, the county jail built on the pauper's principle, a house of correction, 2 hospitals, and a savings bank, are the other buildings of most note. Several fairs are held here during the year; the principal one, which is among the most important in England, commences in October and lasts 4 weeks—Bury St. Edmund's, or St. Edmund's Bury, as the old writers call it, is supposed to be the Roman *Villa Fawstina*. Its name comes from St. Edmund, king and martyr, who received the manor from Beodric after the dissolution of the heptarchy, and was here crowned king of East Angles in 855. After his death and canonization the Benedictines founded here an abbey under his protection, which in after ages became the most magnificent in the kingdom after that of Gloucester. Its walls enclosed, beside the monastery proper, a large churchyard, the abbot's palace, infirmaries, towers, a chapter house, a garden, several chapels, 3 small churches, and the splendid abbey church, founded in 1065, and enriched with numerous ornaments from Caen in Normandy. The abbot, under whom were 50 monks, 15 chaplains, and 111 servants, enjoyed the most extensive privileges, even to the coining of money and infliction of capital punishment. Outside of the precincts of the abbey, but dependent on it, were numerous hospitals and other charitable foundations. On the dissolution of the monasteries this institution was valued by the commissioners at £2,206 16s., which was however much less than its real value. Almost the only relic left of its grandeur is the western of its 4 gates. Portions of the church remain, but are used as dwellings and shops. Parliaments were held here by Henry III. and several other kings.—The town is the birthplace of Sir Nicholas Bacon, Bishop Gardiner, and Bishop Blomfield of London. It gives the title of viscount to the Keppel family. The seat of the margrave of Bristol, the lord of the manor, is in the vicinity.

BURAO, an uncivilized, independent tribe, inhabiting the northern part of the Sierra Madre mountains in the island of Luzon, who tattoo their faces, breasts, and arms, and wear ornaments of ivory, coral, and wood in their ears, like Polynesians. On account of this practice, which distinguishes them from all the other races, wild and civilized, of the Malay archipelago, Novata and other Spanish writers have pronounced the Burao and the Heritua, a neighboring kindred tribe, who also practice tattooing, to be descendants of Pacific Islanders; either colonists, or driven by storm upon the shores of Luzon. Mr. Crawford, the English historian of the archipelago, considers this practice alone a slender foundation for such a supposition. However, a scrutiny of the principal languages of Luzon and of the Maori of New Zealand discloses considerable affinity between them. For instance, the Malay words *makau*,

to eat, and *meor or eyer*, water, are *teu, tau,* and *tau* in New Zealand and the Philippines; and more than a hundred other instances could be adduced, of this class of the first syllable of Malayan words, used by Pacific and Philippine Islanders.

BURBACIUS, ACCURUS GUARINUS (Astruc Guarinus or Buresius), a Flemish scholar and statesman, born at Oudenbosch, in Flanders, in 1592, died near Rouen, Oct. 28, 1692. He was employed on several important diplomatic missions, and officiated for many years as ambassador at Constantinople, until 1662, when he was recalled to take charge of the education of the sons of Emperor Maximilian II. In 1670 he accompanied the archduchess Elizabeth to France, on occasion of her marriage with Charles IX., and filled the functions of ambassador in Paris until 1692, when the political troubles in France compelled him to resort to flight. On his way to Flanders, he was attacked by a party of Leaguers, and although he received no personal injury, the shock was so great that he died before he could reach his destination. During his residence in Turkey, he made a collection of celebrated Greek inscriptions and manuscripts, which he afterward presented to the library at Vienna, and also employed an artist to make drawings of rare plants and animals. His most famous works are his description of his travels in Turkey, and his essay on the Ottoman empire. He was a scholar of great attainments, and a proficient in many languages.

BUSBY, RICHARD, an English schoolmaster, born at Luton, in Northamptonshire, Sept. 27, 1696, died in London, April 9, 1795. He was educated at Westminster school and Oxford; entering the church, he was made prebendary rector of Codworth, in Somersetshire, in 1699, and on Dec. 15, 1699, was appointed head master of Westminster, in which capacity he continued until his death, 55 years afterward. On the restoration of Charles II., he was made prebendary of Westminster, and canon residentiary of Wells. Dr. Busby is traditionally remembered as a severe disciplinarian in his school.

BÜSCH, JOHANN GEORG, a German author of many statistical and commercial works, born Jan. 8, 1738, died Aug. 5, 1800. He was a graduate of Oöttingen, and from 1766 to the time of his death, he officiated as professor of mathematics at Hamburg. He founded in that city a commercial school, and promoted the establishment of a society of fine arts and industry, of which he was the first president. His complete works appeared at Zwickau in 1819-'16, in 16 vols.

BÜSCHING, ALEX. FRIEDRICH, a German geographer, born at Stadthagen, in Schaumburg-Lippe, Sept. 27, 1724, died in Berlin, May 29, 1798. His first geographical work, a description of the duchies of Schleswig and Holstein, was published in 1752. In 1754 he was appointed professor of philosophy at the

university of Göttingen, and in 1760 pastor of the German Lutheran church at St. Petersburg. In 1765 he removed to Berlin. His most important work is his "Universal Geography," which made its first appearance in 1754. That part of it in which he describes the countries and nations of Europe, was translated into English, and published in London in 6 vols. 4to, in 1762.

BUSEMBAUM, HERMANN, a German Roman Catholic theologian, born at Nottelen, in Westphalia, in 1600, died in Münster, Jan. 31, 1668. He was a Jesuit, and in his *Medulla Theologiae Moralis* (which passed through 50 editions), he carried the doctrine of the temporal supremacy of the popes to such a height, that the secular tribunals in almost every European state were unanimous in pronouncing condemnation on his work, and committing it to the flames.

BUSH, in mechanics, the name given to the piece of hard metal, usually brass, fitted into a plumber-block, in which the journal turns. It is sometimes termed the pillow, and the blocks, pillow-blocks. The guide of a sliding-rod is also termed a bush.—Bushing a gun or cannon is inserting a small cylinder of refractory metal, as platinum, in the touch-hole.

BUSH, GEORGE, an American theological writer, born at Norwich, Vt., June 12, 1796. He graduated at Dartmouth college in 1818, studied at Princeton theological seminary, received ordination in the Presbyterian church, and was for 4 years a missionary in Indiana. He devoted himself especially to biblical learning, was elected in 1831 professor of Hebrew and oriental literature in the university of the city of New York, published in 1832 a "Life of Mohammed," and in 1833 an elaborate "Treatise on the Millennium," in which he regards the millennial age as the period during which Christianity triumphed over Roman paganism. About the same time he compiled from tourists, archaeologists, and commentators, a volume of "Scriptural Illustrations," published in 1835 a Hebrew grammar, and in 1840 began the issue of a series of learned and ingenious commentaries on the Old Testament. He edited in 1844 the "Hierophant," a monthly magazine, in which appeared striking articles from his pen on the nature of the prophetic symbols. In the same year he published his "Anastasis," in which he opposed that view of the resurrection which implies a physical reconstruction of the body. This work attracted much attention, and he answered the many attacks which were made upon it in a treatise entitled the "Resurrection of Christ." In 1845 he connected himself with the Swedenborgian church, translated from the Latin the diary of Swedenborg, and has since that time, in numerous addresses, and short treatises, and as editor of the "New Church Repository," labored to develop and maintain the principles of that philosopher. In 1847 he published a work on the higher phenomena of Mesmerism, which he deems a confirmation of the truths of Swedenborg's revelations.

Personally, Prof. Bush is distinguished for his simple manners, and the geniality and kindness of his disposition.

BUSHEL, an English measure of 8 gallons, divided into 4 pecks, used for dry materials, as grain, fruit, coal, &c. The gallon, which by act of parliament of Geo. IV., c. 74, § 7, is defined to determine its capacity, must contain 10 lbs. avoirdupois of distilled water, weighed in air, at the temperature of 62° F., the barometer being at 30 inches; or to contain 277.274 cubic inches. The so-called imperial bushel, then, must contain 2,218.192 cubic inches. But if the goods measured are of a kind usually heaped, as potatoes, coal, &c., it was prescribed, that the capacity, including the raised cone, should be 2,815 cubic inches. This rule was abolished by act of parliament of William IV. The Winchester bushel was the standard before the imperial from the time of Henry VII. (act of 1697). Its capacity was 2,160.42 cubic inches; its dimensions 18½ inches internal diameter, and depth 8 inches. Heaped, the cone was to be not less than 6 inches high, making with a true cone its contents, 2,747.70 cubic inches.—The bushel of the state of New York contains 80 lbs. of pure water at its maximum density, or 2,211.84 cubic inches.

BUSHIRE, or **ABOO-SHEHR**, a seaport town of Persia, in the province of Fars, situated on the N. E. coast of the Persian gulf, at the northern extremity of a peninsula, to the north and east of which is the bay. The climate is extremely hot and unhealthy, producing various kinds of disease, especially of the eyes. In 1831 the plague made a fearful havoc among the population, which, from 20,000 in previous years, has dwindled down to 5,000 or 6,000 in 1858. Beside many huts of palmwood outside of the gates, there are about 400 white stone houses in the town, which present rather an agreeable appearance from a distance; and the badgirs, or ventilators, raised over the houses (chiefly for the comfort of the ladies), to the height of 100 feet, contribute to enhance this impression. The narrow streets, however, of which there are not less than about 800, are in a miserable condition. There are few handsome buildings in the town excepting the East India company's factory and the sheik's palace.—Bushire is the great commercial emporium of Persia. Its merchants carry on an extensive trade with East India, Russia, and Turkey, and supply almost all Persia with goods. The principal imports from India are indigo, sugars, and spices. The steel of India is preferred to that of other countries, and used for the manufacture of sabres. Tin is imported from Banca, and coffee chiefly from Mocha. Manufactured goods are imported from England and continental Europe, a British consular resident having long been maintained at Bushire, owing to the requirements of the increasing commercial intercourse. Many goods sent from Europe to India are thence exported to Bushire. The exports are raw silk, sheep's and goats' wool,

horses, dried fruit, wine, grain, copper, turpines, tobacco, yellow dye-berries, asiatida and various sorts of drugs, rum water, gall-nuts, pearls, and other valuable articles. The principal exports of manufactured articles are carpets, shawls, velvets, silk goods, and gold and silver brocades. Cotton is extensively produced, and chiefly retained for home consumption, although some of it is exported to Russia and other countries. The great route to the interior of Persia starts at Bushire, and is not only of great commercial, but also of great strategical importance. On the land side the town is fortified by a mud wall with round towers. In the late war between England and Persia, Bushire became the basis of military operations, and was captured, Dec. 9, 1836, at the very outset of the expedition.

BUSHMAN'S RIVER forms the boundary between the districts of Cango and Albany, Cape Colony, S. Africa. It empties into the Indian ocean.

BUSHMEN. See **BOJESMANS.**

BUSHNELL, DAVID, an American inventor, born in Saybrook, Conn., about 1742, died in Georgia, 1826. He graduated at Yale college in 1775, and turned his thoughts toward the invention of a machine for blowing up vessels from under water. He exploded, successively, many small models; made a large machine capable of moving an operator with 150 lbs. of powder, which was tried in vain on the *Aglio*, a British 64-gun ship, lying in the harbor of New York. Bushnell prepared a number of machines in kegs to be floated by the tide upon the British vessels lying in the river at Philadelphia, the result of which attempt gave occasion to the ballad of the "Battle of the Kegs," by Francis Hopkinson. Bushnell became a captain in the army, and after the close of the war went to France. It was long supposed that he died in some of the troubles of that country, until, in 1826, it appeared that on his return from Europe he had settled in Georgia as a physician.

BUSHNELL, HOMER, an American theologian, born in 1802, at New Preston, a part of the town of Washington, Litchfield co., Conn. He was the son of Ensign Bushnell, a farmer; and when a boy was employed in a manufactory in his native place. He entered Yale college, and graduated in 1827, when he was for some time occupied as literary editor of the "Journal of Commerce" of New York, and afterward as teacher of the academy in Norwich, Conn. In 1829 he became a tutor in Yale, and occupied this post for 2 years, studying law and theology. In May, 1830, he accepted a call to become pastor of the North Congregational church in Hartford, Conn., and still fills that position. He received the degree of doctor of divinity from the Wesleyan university at Middletown, Conn., and afterward from Harvard university. His earliest production of much notoriety was a Phi Beta Kappa oration, delivered at New Haven, on the "Principles of National Greatness."

The first of his theological books was "Christian Nurture," published in 1847, and devoted to illustrating the author's views on the subject of religious education, the relations of the family as a Christian institution, and other "subjects adjacent thereto," including under this head the philosophy of revivals, and the defining their due limits, as a spiritual power. His next publication was "God in Christ," a collection of 3 discourses delivered by him before 3 different bodies; the *Genio ad Clerum*, a discourse on the divinity of Christ, at the annual commencement of Yale, Aug. 15, 1848; a discourse on the atonement, delivered before the divinity school in Harvard university, July 9, 1848; and a discourse on "Dogma and Spirit," before the Popular rhetorical society, at Andover, September, 1848. These 3 discourses, with a preliminary "Dissertation on Language, as related to Thought and Spirit," and a brief introduction, were published in 1849 in one volume, which attracted much attention and criticism from the apparent heresy of his views on the subject of the Trinity. Dr. Bushnell was brought before the association of Congregational ministers of which he was a member, and after much discussion and opposition was declared free from the specific charge of heretical opinion brought against him. The obnoxious book opens with a dissertation on the inefficacy of language to express thought, and its entire want of power to define or deplete spirit, except in symbolic or analogical phrases. The discourses following, being an attempt to set forth the author's views on certain doctrinal points, conveyed ideas to most readers of a different nature from those intended by the writer, who published his defence in 1851, in a new volume entitled "Christ in Theology, being the Answer of the Author before the Hartford Central Association of Ministers, October, 1849, for the Doctrines of the Book entitled God in Christ," in which he analyzes the elements and formation of theological opinion, and reviewing the great multitude of so-called heresies that in every age have disturbed the unity of the Christian church by innumerable shades of differing belief, he arrives at the conclusion that systematic orthodoxy is not attainable, and that human language is incapable of expressing with any exactness theological science. Other writings of Dr. Bushnell are to be found in articles for religious periodicals, chiefly the "New Englander," to which he has contributed a review of the "Errors of the Times," and of a "Charge by Bishop Brownell, of Conn.," "The Evangelical Alliance," "Christian Comprehensiveness," "The Christian Trinity a Practical Truth," and an account of "Californians," from personal observation. Beside these, he has contributed to the literature of the day many philosophical and metaphysical essays delivered as addresses or sermons. Among these are a discourse on the moral tendencies and results of human history; an oration on work and play; a sermon entitled the "Day of Beasts," another on unconscious influence, another on

titled the "Northern Iron;" an address on religious music; one on "Politics the Law of God;" an oration on the fathers of New England; a historical discourse on the "Age of Homespun;" and a speech for Connecticut, delivered before the legislature.—Dr. Bushnell is a person of nervous temperament and sensitive organization. Rather a poet than a logician, his works are remarkable for graphic and dramatic expression, delicate and acute mental perception, beautiful analogies, and great metaphoric power, mingled with trenchant satire, exquisite pathos, and a vein of genuine practical sense that exists in cooperation with a brilliant imagination and sympathetic emotional traits, rendering him an eloquent preacher, and a man who attracts and retains personal regard in an uncommon degree; though the want of strict argumentative force and the overstrained use of analogy in his writings detract something from his reputation as a theologian and polemic.—During a year's absence in Europe, after visiting Rome, Dr. Bushnell wrote a letter to the pope, from London, April 2, 1846, which was published in the papers of the day, and in which he commends to the notice of his Holiness certain alleged defects in his spiritual and secular administration.

BUSKIN, a kind of boot-leg, covering the outer garment so as to protect the leg. The English men of letters use this word to translate the Latin *cothurnus*, or high-heeled shoe, which the ancient actors used on the stage to give them the appearance of height.

BUSS, FRANZ JOSEPH, a German statesman, born at Zell in 1803. He studied successively philology, medicine, and jurisprudence, and since 1836 has been professor of law and political economy at Freiburg. He first made himself known by translations from other languages. In 1837 he began to engage actively in politics, and was elected to the 2d chamber of Baden. At first an extreme liberal, he soon renounced democracy, and appeared as the champion of ultramontane ideas. In 1848 he was made a member of the German national assembly. To make the Catholic church entirely independent of the state is the object for which he has been and is yet unweariedly active.

BUSSERUT-GUNGE, a small town of Oude, British India, on the road from Cawnpore to Lucknow, fortified by a wall, a wet ditch, a tower commanding the gateway, and various other works. It was the scene of 3 brilliant but indecisive victories over the sepoy, gained by Gen. Havelock and a handful of British, while endeavoring to relieve Lucknow, July 29, Aug. 5, and Aug. 11, 1857.

BUSSEY, BENJAMIN, a merchant of Boston, born in Canton, Mass., March, 1, 1757, died in Roxbury, Jan. 19, 1842. He was a soldier in the revolutionary war, became a silversmith in Dedham, afterward a merchant in Boston, where he acquired a large property, which he bequeathed, with a beautiful estate at Jamaica Plain, after the decease of certain relatives, to

Harvard college, for the establishment of an agricultural school, and the support of the law and divinity schools of that college.

BUST, in sculpture, the figure of a human being truncated below the breast. The etymology of the word is not satisfactorily explained, but it is of Latin origin. The bust includes the head, shoulders, breast, and arms truncated just below the shoulders. It generally stands on a pedestal. Among the ancients the bust of a person was taken, when now his portrait would be painted or his daguerreotype made.

BUSTAMENTE, ANASTASIO, a president of Mexico, born in Guadaluajara, in 1782, died at San Miguel de Allende, in 1851. At the age of 21 he received a diploma as doctor of medicine, began practice in San Luis Potosi, and soon after became family physician to Gen. Calleja, viceroy of Mexico. When the revolution of 1810 broke out, he abandoned a lucrative practice to enter on a military career as lieutenant of a regiment organized by Calleja, called the "faithful lancers of Potosi." He fought in behalf of the Spanish government against the Mexican leaders, Hidalgo, Allende, Aldama, and Abasolo, and participated in the disastrous battle of Calderon; but, disgusted at length with the cruelties of Calleja and his associates, he joined the patriots and served in the republican ranks. When, Feb. 24, 1821, Iturbide pronounced against the Spanish government, Bustamente was one of the first to sustain him, and to urge the plan of independence proposed by him. Iturbide promoted him from colonel of the regular line to the rank of general of division, and appointed him commandant general of the interior provinces, which office he held, participating in nearly all the public affairs of the state, till he was called to the vice-presidency of the republic, Dec. 31, 1829. He took part against the president Guerrero, and in Dec. 1830, Santa Anna having headed a revolution called the "plan of Jalapa," he was charged with the executive power which he retained till Aug. 14, 1832. For the success of his government he was much indebted to his minister, Don Lucas Alaman. Being succeeded in the presidency by Pedraza, he took command of the army, and was soon after overthrown by Santa Anna, and by him banished. He visited France, where he attracted much attention, and is said to have pursued his medical studies. Upon the outbreak of the Texan revolution in 1836 he returned to Mexico, and in 1837 was again elected to the presidency, which he held, excepting a short interval in 1839, till 1841, when he was again overthrown and banished by Santa Anna under the "plan of Jalisco." He fled to Europe, and resided for some time in Genoa, but upon the fall of Santa Anna in 1845, again returned to Mexico, and gave his services to his country in many offices till his death. Bustamente was one of the most honorable of the public men of Mexico, and the republic was prosperous under his administration.

BUSTARD (*etc.*), a large fowl, peculiar to the dry, grassy plains of Europe, Asia, and Africa. They have not been observed either on the American or Australian continents. They were formerly abundant in Great Britain, on the large open woods of Wiltshire, Dorsetshire, and of some parts of Scotland, where it is said that they were coursed, with greyhounds, which is by no means impossible, as they cannot take wing easily or without considerable preparation, and when hard pressed on a sudden have the habit of running with their wings outspread like sails to assist them, after the manner of ostriches, with which they have several points in common. There are 3 European species of this bird, which appears to form a connecting link between the gallinaceous tribes and the ostrich and cassowary. The great bustard (*O. tardo*), so called from his heaviness on the wing, for he is a fleet runner, stands nearly 4 feet high, and weighs from 25 to 30 pounds. The head and neck in the male are red-colored, and on each side of the neck he has a tuft of feathers nearly 9 inches long, springing from the base of the bill, and somewhat resembling those of the American pheasant grouse. Like them, also, they overlay 2 naked spots of skin, which in the bustard is of a violet color. The upper parts of the bird are beautifully variegated with black and rust color on a pale reddish ground. The belly and sides are white. The legs are long, naked above the knee, dusky in hue, and have no hind toe, but a callous prominence serving as a heel. The male bird has a water-sac in the fore part of the neck, having its entrance under the tongue, capable of containing 2 quarts of water. It is said, but probably falsely, that the bustard ejects the contents of this sac as a means of defence against birds of prey. But there is no bird of prey smaller than the golden eagle capable of assailing a fowl of such size, and a spirit of water would hardly check his attack. The female is much smaller than the male, and less highly colored; her neck and head are brown, and she has not the curious water-sac.—The other species, the little bustard (*O. tetrax*) is only 15 inches in length. It generally resembles the larger species in form and color, but its head is reddish brown, while the neck of the male is black, with a narrow white border above and below. The upper parts are mottled with the same colors, but with finer and more distinct lines. This species is very common in France, where it is a shy, cunning, and wary bird, frequenting the barren heaths of Brittany and those singular tracts known as the *landes*. The flesh of the bustards, of both species, is excellent—superior, it is said, to that of the turkey; and it is singular that no attempt seems to have been made to domesticate them. They are mentioned by Xenophon in his "Anabasis," as abundant on the sage plains of Mesopotamia, and are regular autumnal visitants of northern Greece, where they are confounded with the wild turkey.—There are 3 other rare

species of bustards recently discovered. The black-headed bustard (*O. nigricapax*), an Asiatic species, inhabiting the highlands of the Himalayas, and also the open Malvatic country, where it lives in large flocks, and is regarded as one of the greatest delicacies as an article of food. It is nearly 70 inches in length, and its colors, above, are pale bay undulated with rofous brown. Its head, as its name indicates, is black; its neck, belly, and under parts white, with the exception of a black patch on the breast. The *O. carolinensis* of Africa, was discovered by Le Vaillant in the interior of the Caffre country, in south Africa, and in some parts of the colony of the Cape of Good Hope. It appears to have no name in the vernacular; and why it should be called *carolinensis* is not easily to be understood, since its coloring, like that of the other species, its congeners, is reddish brown above, with the under parts of a pale bluish gray. The kori bustard, discovered by Burchell on the banks of the Orange river, is nearly 6 feet in height, and but 7 in extent from wing to wing, while its plumage is said to be so thick as to be proof against any thing short of a rifle ball. Little is known of its character or habits.—The *O. Desfonti*, discovered by Major Denham in central Africa, is another large species, not less than 6 feet 9 inches in height. It is found in the grassy districts immediately to the south of the great desert, in the regions of Lake Tchad and the Dambar country. It is not numerous, and is always found in company with gazelles; like which, it is so famous for the brilliancy of its eyes, that the Arabs, when they wish to describe their most beautiful women, are wont to liken their eyes to those of the *esbara*, which is the general name for all the African bustards. **BUSUAGAN**, an island of the Philippine archipelago, the largest of the group called Calamianes, and inhabited by the Bisaya race. Area, 450 sq. m.; pop. 4,500. The geological formation of the island is volcanic, and the soil is equal in fertility to some of the most productive islands of the group, and yet it is poor and sparsely peopled. It is said that its non-productiveness is owing to the extraordinary quantities of wild hogs, porcupines, squirrels, and rats, which destroy all the fruits of agricultural labor.

BUTCHER-BIRD, a name applied to the great shrike, belonging to the order *passeres*, tribe *dentirostris*, and family *laniide*. The best-known genus of the family is *lanius*, Linn., characterized by a moderately long and strong bill, with the culmen curved and tip hooked and emarginate; tarsus short and strong; toes long and robust, the outer the largest; hind toe long and broadly padded; claws curved and sharp. There are more than 30 species described in America, Europe, Asia, and Africa, of which the butcher-bird (*L. septentrionalis*, Gmel.), or great American shrike, is a celebrated one. The length of this bird is 10½ inches; the extent of wings 14, of the bill along the back 4

of an inch. The plumage is soft and blended; long bristles at the base of the bill; wings of ordinary length, 4th quill the largest; tail long, straight, graduated, of 12 rounded feathers; loral space, behind the eye, wings and tail, brownish black; iris hazel; upper parts light ash-gray, tinged with pale blue; a white streak over eye; lower parts grayish white, tinged with brown on the fore part of breast, and with faint, undulating, dusky bars; base of the primaries white, the secondaries and their coverts tipped with the same; in the female the head and hind neck are tinged with brown, and the lower part has more numerous bars. It is common in the middle and northern states for the greater part of the year, retiring northward to breed; according to Audubon, it is not found along the coast of the southern states, the *L. ludovicianus*, Linn., taking its place. The nest is built of dry grass, leaves, and moss, in the fork of a bush or low tree; the eggs are 5 or 6 in number, of a dull cinereous blue color, spotted and streaked at the larger end with yellowish brown; the time of incubation is 15 days. It frequents woody and bushy places, where it sits perched on a branch continually jerking its tail; its flight is undulating and rapid; it is most commonly seen single, or in pairs, and is wary and hard to approach. It feeds on insects, especially grasshoppers and crickets; but it also attacks and kills small birds, which it tears apart and swallows in large pieces; it pitches downward like a hawk, with closed wings, on the back of its victim, which it instantly strikes in the head, tearing open its skull. In confinement it eats eagerly pieces of fresh beef. It has the singular propensity of impaling insects and small birds on points of twigs and thorns, probably for convenience in devouring them, though in many instances this habit seems to be wanton cruelty, as the bird leaves them to decay. The Rev. Mr. Peabody remarks: "This practice of gathering what he does not want, and keeping it till it can be of no use to him, is regarded as an unaccountable mystery in a bird, while in man the same proceeding is considered natural and wise." It is so bold that it often enters apartments where pet birds are kept, and attempts to seize them from the cages; several have been caught in this manner. It imitates the notes of other birds in distress, and when they flock around to see what is the matter, it pounces into the midst, and rarely fails to secure one. It will pursue birds on the wing, and even small quadrupeds and lizards. Audubon is of opinion that this bird is the same as the *L. accubitor*, Linn., but more recent authorities consider them distinct. The European bird, or great cinereous shrike, is rare in England; it is sometimes trained in Russia for catching small birds, rats, and mice, which, like its American congener, it fixes to a thorn and tears to pieces with its bill; it possesses the same propensity for fixing its food in confinement, according to Selby; it is also called butcher-bird. The *L.*

ludovicianus, Linn., is a native of the southern states, being confined chiefly to Florida, Georgia, and the Carolinas. This is called the loggerhead shrike, and abounds on the rice plantations, where it does good service in destroying field-mice, large grubs, and insects, pouncing upon them like a hawk. In all the butcher-birds the legs and claws are weak, and are never used in tearing their prey; this is effected by their powerful bill, and in this they differ from the true birds of prey, which strike and tear with their talons.

BUTE, an island of Scotland, in the frith of Clyde, about 16 miles long, from 3 to 5 miles wide; area, 60 sq. m.; pop. 9,499. The surface in the northern parts is rugged and mountainous; the central and southern portions are undulating and tolerably fertile. The temperature is mild and equable, and the island is much resorted to by invalids. There are 8 small lakes, Fad, Ascog, and Quein. The town of Rothsay is pleasantly situated on the E. coast, and Mountstuart; the seat of the marquis of Bute, the chief proprietor, is near it.

BUTE, JOHN STUART, earl of, born in Scotland in 1718, died in London, March 10, 1792. In his 10th year he succeeded to his father's title and estates. He was educated at Eton; and in Feb., 1737, he was elected one of the 16 representative peers of Scotland, and in the same year was appointed one of the lords commissioners of police in Scotland. In Aug. 1736, he married the only daughter of Lady Mary Wortley Montagu. In 1750 he was appointed lord of the bedchamber to Frederic, prince of Wales, eldest son of George II. On the death of his royal patron, in March, 1751, the widowed princess of Wales honored him with so much confidence and friendship, that (although Lord Bute lived happily with his wife, who had a large family) it was whispered that their friendship was far too close and intimate. He obtained a great influence, also, over the youthful prince of Wales, who, when elevated to the throne, in 1760, as George III., distinguished him particularly as his favorite, admitting him to the privy council, appointing him groom of the stole, and from that time consulting him on all the principal affairs of state. In March, 1761, Lord Bute was made one of the secretaries of state. His wife was created a British peeress in her own right, as Baroness Mountstuart. In the following October, William Pitt (the elder), finding his powers, as nominal head of the administration, weakened by the vast influence of the new secretary, retired from the cabinet; and in May, 1762, when the duke of Newcastle also resigned, Lord Bute succeeded him as prime minister. With considerable ambition and inconsiderable abilities, Lord Bute was now in an office for which he was ill adapted. Unpopularity gathered around his head. The attack was pointed by John Wilkes and Churchill, the poet, who assailed him because he was a Scotchman, and thereby only embodied the ruling idea among the peo-

ple, England was then involved in what is called the 7 years' war. Lord Bute made peace, but was accused, in conjunction with the peace-maker, of having been bribed to grant too favorable terms to the enemy; and even Lord Camden, many years later, cited his conviction of the truth of the charge, as Bute's patrimonial estate was worth only £1,500 a year, and he was only life-tenant of Wortley, though he sank £300,000 in land and houses. "Junius" also intimates corruption, but with-supporting his charges by evidence. At last, on April 7, 1763, within 5 days after he had been bitterly attacked by name, in Wilkes's "North Briton," the resignation of Lord Bute suddenly took place. He had been premier for little more than 10 months. Retaining his influence over the king, he nominated his immediate successors; but there soon followed a cessation of all intercourse with his majesty. From 1765 they never met; but, for a long time after, his influence was supposed to continue, and was complained of by men in office. Lord Bute went back into private life (his son was placed on the British peerage, in 1778, as Baron Cardiff), passing his time between Scotland and England, with an occasional visit to the continent. The closing years of his life were spent in a villa on the coast in Hampshire. He had some literary tastes, and while in power gave a good dinner to Home, the author of "Douglas"; he manifested some interest in the welfare of the younger Bentley; he granted a pension of £300 per annum to Dr. Johnson; he proposed that the antiquarian society should execute a history of British antiquities; and he published, at his own expense (£10,000), 9 quarto volumes, delineating English botany, and after 12 copies were worked off, destroyed the plates.—Bute's eldest son was created a British marquis in 1793. Lady Louisa Stuart, 6th daughter and 11th child of Lord Bute, survived until Aug. 1851 (aged 94), and contributed some interesting introductory notices to Lord Wharnccliffe's edition of Lady Mary Wortley Montagu's works. One of his grandsons was created Baron Wharnccliffe in 1830; and another was created Baron Stuart de Buteham in 1828.

BUTENIEFF, AN-OLLEMANA, a Russian statesman of the present day, entered the diplomatic career at an early age, and having served in various subordinate capacities in the department of Asiatic affairs, was appointed secretary and councillor of legation at various courts, and finally in 1830 became ambassador in Constantinople. In concert with Orloff and Brunnow he took a prominent part in the negotiations of 1833, and ingratiating himself, by his skilful management of affairs, with the divan, proved a formidable antagonist to the representatives of the Austrian and British governments. The state of his health making a sphere of action desirable for him, he was transferred to Rome in 1844. Here, however, he was less successful in settling the understanding between the holy see and St. Peter-

burg. In 1847 he assisted Count Hindoff in bringing about the concordat. After the conclusion of the treaty of Paris he was sent again to Constantinople, and accredited there as ambassador Aug. 25, 1858. Butenief is a shrewd diplomatist, and at the same time a well-disposed and benevolent man, and a Russian to the core. He is singularly familiar with Turkish affairs.

BUTERA, Giorgio, prince, a fortunate Genoese, son of the Rev. Mr. Wilding, a Hanoverian clergyman (according to other accounts the family name was Schwinge), born about 1790, died in Wiesbaden in 1841. He took service in the English-German legion, and had attained the rank of lieutenant in 1816, when on his arrival in Sicily he was seized with illness. Great attention was shown to him by the family of the prince of Butera, whose daughter fell in love with him, and he finally married her, inheriting his father-in-law's title and estate, and receiving in 1832 the appointment of Neapolitan ambassador in Paris, and afterward in St. Petersburg.

BUTESHIRE, a county of Scotland, consisting of the islands of Bute, Arran, Inchmarnock, and the Caimtays, in the frith of Clyde; pop. 16,098. The constituency of the county in 1853 was 483, and 1 member is returned to parliament. The inhabitants of these islands are principally engaged in agriculture and fishing; there are some quarries and coal mines. Rothesay, the county town of Bute, is a watering place.

BUTLER. I. A western county of Pennsylvania, bordered by the Alleghany river, and having an area of 800 sq. m. The surface is moderately uneven and the soil sandy, but not remarkably productive. It yields, however, fair crops of corn, rye, wheat, and oats, beside affording pasturage for sheep and cattle. Silk is produced to some extent. Bituminous coal, iron, and limestone are abundant. The productions in 1850 were 231,595 bushels of wheat, 237,359 of Indian corn, 585,654 of oats, 31,695 tons of hay, and 690,764 pounds of butter. There were 3 woolen factories, 1 cotton factory, 23 corn and flour mills, 10 saw mills, 14 tanneries, 2 breweries, 5 iron furnaces, 4 foundries, 3 potteries, various other manufactories, 62 churches, 3 newspaper offices, and 7,000 pupils attending public schools. Organized in 1800, and named in honor of General Richard Butler, an officer of the revolution. Pop. in 1850, 80,345; capital, Butler. II. A southern county of Alabama, drained by the Suwanee river, and having an area of 875 sq. m. The surface is hilly and in great part covered with pine woods. The quality of the soil is fair. Cotton, corn, and sweet potatoes are the chief staples. The productions in 1850 were 4,094 bales of cotton, 305,272 bushels of Indian corn, 84,890 of sweet potatoes, and 30,380 pounds of rice. There were 23 corn and flour mills, 5 saw mills, 1 newspaper office, 3 churches, and 295 pupils attending schools and academies. Pop. in 1850, 10,836, of whom 4,629 were slaves. Capital, Greenville. The county is traversed by the proposed route of the

Mobile and Girard railroad. III. A south-western county of Kentucky, intersected by Green river, which is here navigable by steamboats, and having an area of 500 sq. m. The face of the county is uneven and the soil moderately fertile. Cultivation is bestowed principally upon corn, oats, and tobacco. Live stock is also reared. The productions in 1850 were 289,774 bushels of Indian corn, 40,840 of oats, and 207,819 pounds of tobacco. There were 9 corn and flour mills, 1 saw mill, 18 churches, and 818 pupils attending public schools. Value of real estate in 1855, \$611,539. Pop. in 1850, 5,755, of whom 681 were slaves. Capital, Morgantown. IV. A south-western county of Ohio, bordering on Indiana, and having an area of 455 sq. m. It is generally level, fertile, and remarkably productive. The crop of Indian corn in 1850 exceeded that of any other county in the state except Ross; there were 2,737,784 bushels raised, beside 291,782 of wheat, 844,517 of oats, and 10,494 tons of hay. An excellent species of limestone for building purposes underlies the county. Water-power is abundant, and the transportation of the agricultural products is greatly facilitated by the Miami canal and railroads from Cincinnati to Dayton, and Richmond, Indiana, which pass through the county. Pop. in 1850, 80,789. Capital, Hamilton. A number of interesting monuments of the aboriginal inhabitants have been discovered in this county, chiefly on the banks of the Great and Little Miami rivers. Some of them are works of defence consisting of earthen ramparts from 4 to 9 feet high, thrown around the brows of hills, enclosing from 16 to 95 acres of ground, and entered by gateways protected by intricately arranged embankments; others appear to be traces of sacred enclosures, and of others it is difficult to conjecture the design. They have been fully described by Messrs. Squier and Davis in their "Monuments of the Mississippi Valley." V. A south-eastern county of Missouri, bordering on Arkansas, and having an area of 560 sq. m. The surface is level or moderately hilly, and the soil suited to the growth of Indian corn, wheat, and oats, which together with cattle form the staples. The productions in 1850 were 2,337 bushels of wheat, 55,800 of Indian corn, 3,058 of oats, and 1,558 pounds of wool. There were 4 churches, and 91 pupils attending public schools. The county was named in honor of William O. Butler, of Kentucky. Pop. in 1856, 2,152, of whom 48 were slaves. In 1850 there were 53 slaves, and 1,563 free inhabitants. VI. A newly erected north-eastern county of Iowa, consisting mainly of uncultivated prairie land, drained by several branches of Red Cedar river; area, 576 sq. m. In 1856 it produced 723 tons of hay, 5,409 bushels of wheat, 6,906 of oats, 53,605 of Indian corn, and 7,711 of potatoes. Capital, Clarks-ville. Pop. in 1856, 2,141.

BUTLER, ALBAN, an English Catholic biographer, born at Appletree, Northampton-

shire, in 1710, died at St. Omer, in France, in 1773. Having become a clergyman of the Catholic church, he was chaplain for some time to the duke of Norfolk. He subsequently became president of the college of St. Omer, in France. He wrote several works, of which the best known is the "Lives of the Fathers, Martyrs, and other principal Saints." This has been translated into many modern languages.

BUTLER, ANDREW PICKENS, U. S. senator from South Carolina, 5th son of Gen. William Butler, born in Edgefield district, S. C., Nov. 17, 1796, died near Edgefield court-house, May 25, 1857. He graduated at South Carolina college in 1817, and was admitted to the bar in 1819. As a lawyer he practised in the circuit courts of Edgefield, Barnwell, Orangeburg, Lexington, and Newberry, and here laid the foundation of his reputation, not simply as a sound lawyer and eloquent pleader, but for good sense, political foresight, and a lively, companionable humor. In 1824 he was elected to the legislature as the representative of his native district. In 1827 he was one of the committee in the legislature who prepared the articles of impeachment and conducted the prosecution against Judge James, a veteran of the revolution, charged with incompetence and drunkenness. In 1829 he married Susan Ann, daughter of Col. Eldred Simkins, of Edgefield; but she died prematurely, only a few months after marriage. In 1831, a period marked by the apprehended collision of South Carolina with the federal government, on the nullification issue, he was elected colonel of a regiment of cavalry. In 1838, still a member of the legislature, he was made a judge of the courts of general sessions and common pleas. Subsequently, when a change was made in the judiciary system, he was transferred to the supreme bench of the state, where he continued until 1846, when he was elected a senator in congress. Soon after taking his seat in this body, he was appointed chairman of the judiciary committee. One of his earliest speeches was against making Col. Benton lieutenant-general of the army. He made 2 others upon a call for supplies to support the war against Mexico. His report upon the fugitive slave law was maintained by an elaborate effort upon the floor. His speech upon the Pacific railroad has been preserved in pamphlet form. By request he defended President Pierce's veto of Miss Dix's bill, appropriating public lands for a lunatic asylum. The Kansas question, the action of the naval retiring board, the abolition question, and all others affecting the peculiar interests of South Carolina, and the general welfare of the south, engaged him in frequent debate, in which he always took a conspicuous part. His last speech was in reply to Mr. Sumner, and in defence of South Carolina. His speeches and reports well merit the examination of the student who seeks to understand the pregnant period of our political history between 1846 and 1857. Judge Butler, himself, lived mostly a public life during all this period. He had sur-

vived nearly all his numerous kindred, 5 brothers and a sister. In 1832 he had married Harriet, daughter of William Edward Hayes, and in a short time he was again a widower, with a single living child. The domestic dissolution, and the incessant strife of public life, contributed to subvert an otherwise vigorous frame and elastic temperament, and hastened his death.

BUTLER, CHARLES, a Catholic historian and juriscounsil, born in London, Aug. 16, 1760, died there, June 2, 1832. He was son of a linen draper in Pall Mall, and nephew of the Rev. Alban Butler, author of "Lives of the Saints." He was called to the bar in 1791, and was the first Roman Catholic who was admitted, after the passing of the relief bill of that year. He wrote various pamphlets and other productions which attracted little notice; after which he produced *Hours Devotives*, giving a history of the original text, early versions, and printed editions of the Old and New Testaments, and also of the Koran, the Zend-Avesta, and the Edda. This first appeared in 1797, and ran through 5 editions and a French translation. This was followed by *Hours Juridiques Subsecivæ*, a connected series of notes respecting the geography, chronology, and literary history of the principal codes and original documents of the Grecian, Roman, feudal, and canon law. He continued and completed Hargreave's "Coke upon Littleton." He supervised the 6th edition of Fearn's "Essay on Contingent Remainders," and contributed to Seward's "Anecdotes" an interesting "Essay on the Character of Lord Mansfield's Forensic Eloquence." He wrote a history of the geographical and political revolutions of Germany, and a "Historical and Literary Account of the Formularies, Confessions of Faith, or Symbolic Books of Roman Catholic, Greek, and Principal Protestant Churches." During his last 25 years Mr. Butler principally devoted his pen to the vindication of the Catholic church. He wrote numerous biographies of eminent Catholic divines and authors; he continued his uncle's "Lives of the Saints," and produced "Historical Memoirs of the English, Irish, and Scottish Catholics." When Southey's ultra-Protestant "Book of the Church" appeared, it was replied to in Butler's "Book of the Roman Catholic Church," which gave rise to 6 answers on the Protestant side, 2 of which (by Dr. Hensfield, bishop of London, and the Rev. George Townsend) were responded to by Mr. Butler. In 1822 was published the first volume of Mr. Butler's "Reminiscences," an autobiography. The second volume appeared in 1827. As a constitutional lawyer his reputation was very high.

BUTLER, CYRUS, a merchant of Providence, R. I., born in 1767, died at Providence, Aug. 22, 1842. He was the son of Samuel Butler, originally a common shoemaker, who removed from Edgartown in Massachusetts to Providence about the year 1750. Establishing himself in trade, he reached a high

degree of prosperity, which was shared by his sons Cyrus and Samuel, who were, however, brought up in habits of the strictest economy, and disciplined on the shoemaker's bench to the use of the awl and tapestry. The business was conducted in the name of Samuel Butler and Sons, and on the death of the father passed into the hands of the sons. Samuel Butler, Jr., had but 2 children, a son and a daughter; the former survived his father but a few years; the latter became the wife of Alexander Duncanson, and her uncle Cyrus having lived and died a bachelor, she inherited his great wealth, and that of her father and grandfather. Her uncle's estate was estimated at between \$3,000,000 and \$4,000,000. Several years before his death, at the instance of Miss Dix, so widely known for her philanthropic exertions, he gave \$40,000 to endow the Butler hospital for the insane in Providence.

BUTLER, JAMES, duke of Ormond. See ORMOND.

BUTLER, JAMES, a partisan officer of South Carolina during the revolution, born in Prince William co., Va., removed to South Carolina in or about the year 1772. He settled in what was then a frontier region of the country, and was soon called upon to take a part in Indian warfare. He was a good woodsman, and an excellent shot with the rifle. He was in what was called the "Snow Camp expedition," under Gen. Richardson,—an expedition involving the first struggles of the civil war in South Carolina with which the revolution began. Subsequently, he served under Gen. Williamson, in a similar expedition, in 1776. When Lincoln had taken the command of the continental forces of the South, Butler joined this general near Augusta in 1779. After the fall of Charleston, in 1780, and when the state was supposed to be completely in the power of the British, Lord Cornwallis issued a proclamation requiring the people to swear allegiance to the crown. Butler was one of those who refused. He was arrested, lodged in the goal at Ninety-Six, was subsequently conveyed to the provost of Charleston, and then to the prison-ship. He was kept for 18 months in close confinement. When released, and on his return home, he was suddenly summoned forth to engage in an expedition against a band of the Tories of his precinct, and was killed in the massacre which followed at Cloud's creek.

BUTLER, JOHN, a tory leader during the American revolution, born in Connecticut, left his native state before the outbreak of the war, and settled in the valley of Wyoming. Here, at the very beginning of the struggle, he organized a band of marauders and murderers, who were all painted and dressed like Indians, but who were in reality, for the most part, American traitors and vagabonds in disguise. At the head of these miscreants, he attacked and plundered the villages of that region, and slaughtered their inhabitants. The British government, on the conclusion of the war, generously granted But-

ler 5,000 acres of land in Canada, and a pension of £500 a year.

BUTLER, JOSEPH, an English theologian and moralist, born at Wantage, in Berkshire, May 18, 1692, died in Bath, June 16, 1752. He was educated in the Presbyterian communion, and early gave proofs of an extraordinary aptitude for abstruse speculation. In 1718 he addressed a series of letters to Dr. Clarke stating 2 objections to the reasoning in his "Demonstration of the Being and Attributes of God." The sagacity displayed by his correspondent was such that Dr. Clarke published the letters with his replies to them in the subsequent editions of his work. About this time Butler adopted Episcopal views, and with the reluctant permission of his father entered the university of Oxford in 1714, and was soon after admitted into holy orders. On the united recommendation of his college friend Edward Talbot and of Dr. Clarke he was appointed preacher at the Rolls in 1718, and in 1726 was promoted to the wealthy but secluded rectory of Stanhope. Before leaving the Rolls he published a collection of 15 sermons, which reveal his metaphysical rather than eloquent cast of mind, and are admirable for their logical symmetry. The first 8 of them are upon human nature, which he surveys as an organic system or constitution, and finds its law or ruling principle in the supremacy of conscience. Though he combats those moralists who make self-interest the only motive of action, and affirms the authority of the moral faculty over both the passions and affections of the soul, and the acts of life, yet he does not pronounce upon the nature of conscience, does not venture to designate it by a constant name, and it is difficult to say whether he regarded it as a power of sentiment or of reason. After 7 years of retirement at Stanhope, he was appointed chaplain to Lord Chancellor Talbot, and in 1736 became clerk of the closet to Queen Caroline, who sought to adorn her court by the presence of divines as well as statesmen. In that year he published his "Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature." This work, though but a commentary on a pregnant passage of Origen, and though its argument has but a narrow compass, is yet one of the most profound and original theological studies in the language. It is designed neither positively to establish religion nor directly to answer objections to it, but only to prove that the principal preconceived objections which are raised against Christianity may also be raised against the structure of the universe and the course of nature. By presenting parallel difficulties in admitting the divine authorship of nature and of the Christian revelation, he does not demonstrate the latter, which can only be done by positive evidence, but he destroyed the *prima facie* advantage which the deist of the 18th century had assumed in discussion with Christians. His argument does not pretend to establish the truth of Christianity, but is irresistible

in removing the anterior obstructions to a consideration of its evidences. This work, the fruit of many years' reflection, is composed in a most compressed and ungraceful style. Sir James Mackintosh says that no other thinker so great was ever so poor a writer. In 1738 Dr. Butler was made bishop of Bristol, whence he was promoted in 1750 to the see of Durham. A charge which he delivered to the clergy of the latter diocese, upon the importance of ceremonial worship as subservient to the reality and power of religion, and the circumstance that he introduced into his chapel a white marble cross, gave rise to a report, contradicted by his nearest friends, that he had secretly joined, and that he died in, the Roman Catholic communion. His death occurred while on a visit to Bath in hope of recovering his health, which had rapidly declined, and he was buried in the cathedral of Bristol, where 2 monuments are erected to his memory. Dr. Butler is described as having possessed a pale, thin, placid face, and white hair hanging gracefully upon his shoulders. He was never married. Among his few eccentricities was a custom of walking for hours in his garden during the darkest nights of the year. His character and writings were highly estimated by Hume and Lord Kames, who both sought an introduction to him; which, however, he declined, "on the score of his natural diffidence and reserve, his being unaccustomed to oral controversy, and his fear that the cause of truth might thence suffer from the unskilfulness of its advocate."

BUTLER, COL. PIERCE M., governor of South Carolina, son of Gen. William Butler, born in Edgefield district, S. C., April 11, 1798, killed in the battle of Churubusco, Aug. 20, 1847. After completing his school education he became temporarily a clerk to his elder brother, George. When Mr. Calhoun was secretary of war, Butler was appointed to a lieutenantcy in the 7th infantry. He attained the rank of captain, and served in that grade for some years. However, on his marriage, he resigned his commission, and was made cashier of the bank of the state, at Columbia, of which he subsequently became the president. He resigned the office to accept a lieutenant-colonel's commission under the state, in the Seminole war in Florida, in the dragoon regiment of Col. Goodwin. Upon his return from Florida he was elected governor. On the expiration of his term of office he accepted the appointment from the U. S. government of agent for the Cherokees, west of the Mississippi; was removed from this office by Mr. Polk, who, however, appointed him to treat with the Comanche Indians. On his return to Washington to give an account of his mission, he received advices that he had been elected colonel of the Palmetto regiment of South Carolina, just then raised for volunteer service in the Mexican war. He at once accepted the appointment, and hurried home to his command. The rest of his career is that of the Palmetto regiment. It took part

in nearly every action following that of Cerro Gordo, until the conquest of Mexico, its flag being the first planted on the walls of the conquered city. In the battle of Churubusco Col. Butler, though already severely wounded, was gallantly leading his regiment, when he was shot through the head, and died on the field.

BUTLER, RICHARD, a major-general in the army of the United States, killed in the conflict between the Indians and the army of Gen. St. Clair, Nov. 4, 1791. The disaster of that day, and the death of Gen. Butler, were the consequence of a panic which had seized the militia in the first hour on the sudden attack of the Indians. As Butler lay bleeding and helpless on the ground, a savage tomahawked and scalped him.

BUTLER, SAMUEL, an English poet, born at Stroudham, Feb. 13, 1612, died in London, in 1680. The son of a farmer, he commenced his education at Worcester, and sought inefficiently the means of studying at Cambridge. As clerk to a justice of the peace he obtained leisure during several years to cultivate literature and the arts. He is afterward found in the family of the countess of Kent, where he enjoyed the use of a library and the conversation of the learned Selden, who often employed him as an amanuensis. His next appointment, probably as tutor, in the family of Sir Samuel Luke, a Bedfordshire gentleman, an ardent Puritan, one of Cromwell's officers, and who is supposed to have been the original of Sir Hudibras. After the restoration he was appointed secretary to the earl of Carbery, president of Wales, who made him steward of Ludlow castle. At 50 years of age he married a widow of good family and fortune, but the fortune was lost by bad investment. In 1665 appeared the first part of "Hudibras," a poem in ridicule of the Puritans, abounding in wit, learning, satire, and ingenious thought, and which has remained without a rival in English burlesque poetry. The knight Sir Hudibras and his squire Ralph were as truthful representatives of English Puritanism as Don Quixote and Sancho Panza were of Spanish knight-errantry. They are made to present a most grotesque appearance, in ludicrous exaggeration of the affected language, dress, and moral severity of the Cromwellians. The poem exactly suited the prevalent taste of the time, and obtained the highest popularity. It was quoted by Charles II., studied by the courtiers, and applauded by the whole royalist party. The only recompense received by Butler was a present of £200 from the king. Two other parts of it were published in 1664 and in 1678, but it was left unfinished. Many of its allusions have now become unintelligible without notes, and its condensation of thought and style and its monotony of wit make its continuous reading wearisome. Although Butler enjoyed a great reputation as a brilliant court and among distinguished men, there is even less known of the later than of the earlier part of his life, and it is only certain that he died in poverty and obscurity in a narrow street in Lon-

don. Among his shorter poems is one on the "Elephant in the Moon," in which he ridicules what he deemed the whimsical philosophical researches of the royal society. Of his few prose works, the "Character" are the most interesting. Sixty years after his death a monument was erected to his memory in Westminster abbey.

BUTLER, Dr. SAMUEL, bishop of Lichfield, Eng., born at Kenilworth, in the county of Warwick, Jan. 3, 1774, died at Redeshall castle, Staffordshire, Dec. 4, 1849. He was educated at Rugby and Cambridge, in 1797 was elected fellow of his college, and in 1798, in his 25th year, was appointed head master of the endowed school of Shrewsbury, in which he continued 33 years. While thus occupied, permanently obtaining reputation and rapidly amassing wealth, he successively received several church preferments: in 1802, the vicarage of Kenilworth, his native town; in 1817, a prebendal stall in Lichfield cathedral; in 1822, the archdeaconry of Derby. He was made D. D. in 1811, and was appointed bishop of Lichfield in 1826. His health began to fail soon after this promotion, which he lived to hold only 2 years. His best known literary production is his edition of *Æschylus*, from the text of Stanley. Previous to his appointment to Shrewsbury, he was requested to prepare this by the syndics of the Cambridge university press. This work appeared in 4 vols. 4to, in 1807-'18. Dr. Blamfield (since bishop of London) severely criticised the first 2 volumes in the "Edinburgh Review," and was attacked for doing so in a "Letter" from Dr. Butler. In conjunction with the Rev. Francis Hodgson, Dr. Butler translated Lucien Bonaparte's epic of "Charlemagne." He published numerous tracts and sermons, but his best works were educational.

BUTLER, SAMUEL, an American publisher and bookseller, born in 1770, died in 1847, at Northampton, Mass., where he had begun business in 1792. The booktrade in this country was then in its infancy, and his establishment was the first of the kind in western Massachusetts. It required no small amount of enterprise and resolution to commence the publishing business at that time in a retired country town, at a distance from market, yet he conducted it with so much caution and skill that after the lapse of 60 years the house and the business are still continued. As early as 1800 he published an edition of Vattel's "Law of Nations," the first printed in the United States, and at the same time the first volume of the first edition of the Massachusetts supreme court reports; also, Dwight's "School Geography," which became so popular as to require a yearly issue of 20,000 copies. He also engaged in papermaking, and made the first American letter paper used by the senate of the United States.

BUTLER, WILLIAM, a general of militia in South Carolina, born in Prince William co., Va., in 1750, died in Sept. 1821. He became a lieutenant in the army of Lincoln in 1779, was

engaged in the battle of Stono, and served in the famous corps of Pulaski, until the death of the latter, at the siege of Savannah, disorganized his legion. The fall of Charleston soon followed the disastrous defeat of the Americans and French before Savannah, and the militia was temporarily dispersed, while the continental forces were in captivity. But, with the first rising of the partisan leaders of Carolina, William Butler joined the troops under Gen. Pickens. Subsequently, he served with Lee, under Greene, at the siege of Ninety-Six, and was detached on several separate services, involving the necessity of equal celerity, courage, and vigilance. It was on one of these expeditions, while under the command of Gen. Henderson, that Butler first met the lady, Behethland Foote Moore, whom he subsequently made his wife. After Greene's defeat at Ninety-Six, Butler joined the legion of Lee for a season, but soon took the field as a partisan, served for a while with Pickens, and at length rose to a command of mounted rangers. At Dean's Swamp, associating his command with that of Capt. Michael Watson, they were severely handled in a fight with a superior force of loyalists. Watson fell, and Butler took the command, continued to fight against the greatest odds, and only escaped massacre by the timely arrival of a reinforcement from Orangeburg. In another sharp struggle with a similar enemy, upon the Edisto, when Judge Ryan, the first in command, was shot down, Butler assumed the lead and succeeded in driving the foe across the river. While in command of the rangers, under Pickens, he had frequent conflicts with the notorious Bill Cunningham, one of the most reckless and desperate of all the loyalists. In the fall of 1781, near Carradine's ford, they had one of these sharp passages, which was rather a duel than a battle, and enlivened by many curious incidents. Butler, goaded by personal enmity, pursued Cunningham for miles with a vindictive spirit fully equal to his own. It was a prolonged running fight of several hours, frequently renewed. Butler served thus to the close of the war, was a favorite of Pickens, and usually employed in services which called for audacious enterprise and rapid movement. In 1784 he married Behethland Moore. Soon after he was nominated as brigadier-general by Pickens, who then held the rank of major-general. Pickens resigning in 1796, the legislature elected Butler to that dignity. In 1800 he was elected to congress, in opposition to Robert Goodloe Harper. He took his seat in 1801, and served till 1806, when he was appointed chairman of the committee of investigation in the case of Wilkinson, charged with complicity in the Burr conspiracy. Wilkinson making some offensive remark touching a "prosecuting militia general," Butler resigned his place as chairman, and sent Wilkinson a message. The result was a much friendlier temper on the part of the latter. A major-general of militia at home, Butler declined the

commission of a brigadier in the regular service, which was tendered him by Madison. In 1813 he resigned his seat in congress, in order to make way for Mr. Calhoun. In 1814 he was called, by a very complimentary order from Gov. Allston, to take command of the forces of South Carolina, which state was then supposed to be in danger of British invasion. He repaired to Charleston for this purpose, but the menaced danger passed off, and the blow subsequently fell on New Orleans. Butler retired at the close of the war, and resumed the duties of his farm. In the interval between our two wars with Great Britain, he was elected a member of the convention of 1787, in Charleston, to consider the adoption of the federal constitution, and, along with Gen. Sumter and others, voted against it. He was subsequently a member of the convention which framed the present constitution of the state; was for some time a member of the legislature; was sheriff (then an officer of high distinction) in 1794; and at one time served as a magistrate. He was large and handsome of person, 6 feet high, a bold rider, with a great passion for horses, active, eager, and determined. He was remarkable for the fearless independence of his character. He sought the turf with pleasure, ran famous horses, kept none but blooded animals, and made his own sons break his colts, even at the peril of their necks. Tradition preserves sundry remarkable stories of his own dare-devil horsemanship. He had numerous children. Two of his sons, James and George, died the same month and year with himself. James was sheriff of Edgefield district, and a colonel of cavalry. George was a lawyer, but, during the war of 1812, served as major in the regular army. William was a physician, and served as surgeon at the battle of New Orleans; he was also, for a single term, a member of congress. Frank died as colonel of the Saluda regiment.

BUTLER, WILLIAM ALLEN, a living American lawyer and poet, born in Albany, N. Y., in 1825. He graduated at the New York university in 1843, studied his profession in the office of his father, Hon. B. F. Butler, travelled in Europe from 1846 to 1848, and since his return has been actively engaged in the practice of the law in New York city. He published an academic poem, entitled the "Future," in 1846, and has contributed many papers in prose and verse to the "Democratic Review," the "Art-Union Bulletin," and the "Literary World." In 1850 he published a volume of the character of "Rejected Addresses," entitled "Barnum's Parnassus," and in 1857 the poem of "Nothing to Wear," which passed through numerous editions, and was followed by many imitations. A new poem by Mr. Butler, entitled "Two Millions" was issued in the summer of 1858.

BUTLER, WILLIAM ORLANDO, an American general, born in 1798, in Jessamine co., Ky., whither his father, Percival Butler, a native of

Pennsylvania, who was made adjutant-general during the war of 1812, had removed in 1794. The son was about devoting himself to the legal profession, when the war of 1812 broke out. Reluctant as a private soldier in Capt. Hart's company of Kentucky volunteers he gained distinction in the battles at Frontstown and the river Raisin, and having been for a short time detained in prison by the English, he was, on returning home, promoted to a captaincy. Subsequently he took a conspicuous part in the battles of Pensacola and New Orleans, was brevetted major, Dec. 23, 1814, acted as aide-de-camp to Gen. Jackson from June 17, 1816, to May 31, 1817, when he rendered his resignation, resuming for the next 23 years the profession of the law, marrying, and residing at his paternal estate, near the confluence of the Kentucky and Ohio rivers. From 1830 to 1845 he served as a representative in congress from that district, in the interests of the democratic party. Nominated as a candidate for governor of Kentucky in 1844, he was defeated by the influence of Mr. Clay. Created major-general, June 29, 1846, he led with great spirit the daring charge at Monterey, and although wounded on that occasion, he still remained for several months with the army. By resolution of congress of March 2, 1847, a sword was presented to him in testimony of his services. On Feb. 18, 1848, he succeeded Gen. Scott in command of the army in Mexico. The most important operation during his tenure of this office was the defeat of Pedro Santa and his guerrilla forces by Gen. Lane. His military administration in Mexico was brought to a close on May 25, 1848, when he announced the ratification of the treaty of peace. After his return to the United States he was nominated in 1848 by the democratic party as candidate for the vice-presidency, Gen. Cass being the candidate for president, but was defeated by the election of Gen. Taylor.

BUTRET, G. DE, baron, a French horticulturist, died at Strasbourg in 1805. He was of a noble family, but renounced his rank and fortune in favor of his younger brother. His book on the pruning of fruit-trees has been repeatedly reprinted. He had made preparations for a magnificent garden and horticultural school in the vicinity of Strasbourg when the revolution obliged him to leave France. He passed to the court of the elector palatine, who intrusted to him the management of his gardens.

BUTT, ISAAC, an Irish politician and lawyer, born at Glenduff, county of Donegal, Ireland, 1813. He obtained a scholarship in Trinity college, Dublin, in 1832, and graduated with distinction in 1836, taking honors in classics and mathematics. In May, 1836, he was elected to the professorship of political economy (founded in 1832, by Archbishop Whately); was called to the Irish bar in 1838, and made queen's counsel in 1844. In the Irish estate trials of 1846, Mr. Butt ably defended several of the accused. He was an abettor of Dublin for some years. In

1850 he unsuccessfully contested the parliamentary representation of Mayo, and sat for Harwich from May till June, 1853. He was elected M. P. for Youngfaul in 1852, and again in 1857. Mr. Butt has written a novel, as well as political pamphlets, and was the first editor of the "Dublin University Magazine."

BUTTAFUOCO, MARTIN, a Corsican general and diplomatist, born in 1750 at Vescovato, died in 1799. When the duke de Choiseul determined to re-unite Corsica to France, Buttafuoco was one of his principal agents. In 1766, when the Genoese ceded to France their claim to Corsica, it being impossible for the island to maintain an independent existence, Buttafuoco favored and contributed to its simple incorporation into the French kingdom. He was chosen deputy from Corsica to the states general in 1789, and there avowed himself a partisan of the old régime. This course excited great displeasure among his compatriots, and in several of the Corsican towns he was burnt in effigy. He also received an angry letter from Napoleon himself, then only a lieutenant of artillery at Ajaccio.

BUTTE, a northern county of California, bordering on Utah, and having an area of about 5,000 sq. m. The surface is uneven, and in some parts mountainous, being traversed by the Butte mountains, from which it is named, and having several remarkable elevations, one of which, called Table mountain, bears a strong resemblance to a castle. The highlands are generally covered with noble pine and cedar forests; the valleys are also well wooded, watered, and fertile. The productions in 1856 were 165,000 bushels of wheat, 210,000 of barley, and 6,000 oats. There were 2 grist mills, 16 saw mills, and 1 newspaper office. The county is exceedingly rich in minerals, embracing not only gold, but also platinum, silver, quicksilver, iron, and lead. In 1856, there were 24 large quartz-crushing mills in operation, and the amount of capital invested in river mining on Feather river and its forks was \$400,000. The annual yield of the placer mines was estimated at \$500,000. Capital, Hamilton. Pop. in 1852, 8,572.

BUTTE RIVER rises in Butte co., California, and taking a S. S. W. course, joins the Sacramento in Sutter co.

BUTTER (Gr. *βουτυρον*; *Baux*, a cow, and *typer*, cheese or coagulum), the oily matter in milk, which, when separated from it, is solid at ordinary temperatures. It exists in the milk in the form of globules, and these tend to rise from the serum part of the milk, and collect in the cream on the surface, of the substance of which it forms about 4.5 per cent. Mention is several times made of butter in the English version of the Old Testament, but the Hebrew word thus translated is supposed by scholars to mean some liquid preparation of milk or cream. The oldest distinct allusion to butter is by Herodotus. In the works of other writers of about the same period reference is made to it. The Thracians

ate it; but the Greeks regarded it as a wonderful kind of food. It appears to have served as an ointment, and to have been in very general use for this purpose among the different nations of Europe. It is related by Plutarch that a certain Spartan lady visiting Berenice, the wife of Deiotarus, the former smelt so strongly of sweet ointment, and the latter of butter, that neither could endure the other. Dioscorides describes how butter is made by agitating the fattest milk, as that of the sheep; and Galen treats of the comparative qualities of that made from the milk of different animals; but none of these early writers make any mention of its being used except as an ointment in the bath, or as a medicine, by any other people than the Thracians and the ancient Germans. Cheese appears to have come into general use as food long before butter, and to this day among the nations of southern Europe the latter article is sold by the apothecaries as a medicine, its place as an element of food being occupied, as it always has been, by vegetable oils.—Milk consists of whey or serous matter, in which the caseine or cheese is held in solution, and with which the butter globules are mechanically mixed. When thoroughly separated from the other substances, these globules form the solid butter, but there is always more or less water intermixed, and some caseous matter also, which by its fermentation induces the rancidity in butter long kept. Dr. Thomson found a sample of the best butter to consist of water 12.79, butter oil 86.27, and caseine or curd 0.94. The butter oil is soluble in ether, and the caseine is not. The proportions of the ingredients may hence be ascertained by making this solution after the water has been expelled at a temperature of 212°; but if other ingredients are present, they must be estimated by other processes; thus salt is determined from the amount of ash left by a weighed portion of the butter after incineration. Butter oil is a substance of very complicated composition, in which no less than 6 different organic acids are detected, and a sweet sirup called glycerine, with which these acids are combined. Bromels found in 100 parts of butter 68 parts of margarine, and 80 of butyroleine—compounds of margarie and butyroleic acids with glycerine. The remainder was glycerine divided among butyric, caproic, caprylic, and capric acids. When milk or cream (which most abounds in the fat globules) is agitated, as in the process of churning, these globules are in part broken up and run together, forming at last a mass of butter. No chemical change is involved in this, though the ingredients of the milk are thus made to separate in part from each other. The product is obtained from sweet cream, or from cream that has become sour, and as the latter yields it more readily, it is usually preferred for churning. Milk has the disadvantage of requiring a large quantity to be made use of to produce a small amount of butter; and the residue, called buttermilk, involves a considerable loss, unless

in localities where this finds a more profitable use than to be fed to swine. Still the largest quantity of butter may be obtained from the entire milk. The temperature at which the process is conducted is found to have an important effect upon the result, not only in the time required to separate the butter, but also in its quality. The most suitable temperature is found to be from 50° to 55° F., the lower degree being the best for cream, and the higher for milk. During the process the temperature rises three or four degrees. The process requires some experience in order to conduct it at the most advantageous rate: if butter made from cream is more than an hour in forming, it is apt to be strong-tasted; and if made in less than three-quarters of this time, it is soft. The vessel used for this operation is called a churn, and is made in a variety of forms, some of which are described in the article CHURN. They are usually preferred of wood; but of whatever material they may be, the most particular attention is required to keep them, as well as the other utensils employed, in a perfect state of cleanliness. Even the making of butter by persons whose hands are liable to be moist by perspiration is objected to; and in all cases, in a well-kept dairy, meal, instead of soap, should be used for washing the hands. The purity of butter is so easily affected, that even the place in which it is made should be free from all bad odors. When formed in the churn, it is removed to a small tub, and then worked by kneading it with the hands, with the free use of cold water for thoroughly washing it. Little spades are sometimes in part substituted for the hands. By this operation and beating it with the hands, the buttermilk is, or should be, entirely separated. If any remains, the caseine and sugar contained in it are subject to decomposition, the former becoming putrescent, and the latter changing into acetic acid, thus spoiling the butter. If intended to be kept a long time, it may be preserved after the method practised in India and in some parts of Europe. It is dissolved by heat into oil, by which the water it contains is removed; straining the oil, the caseine is left in the cloth; then being put up in tight bottles it becomes solid, and is subject to no further change. This is the substance called *ghes* in India. In this country and in England another process is adopted for its preservation. To the butter fresh from the churn a quantity of fine salt, amounting to an ounce to the pound, is added and thoroughly incorporated with it. This is effected to the best advantage by working in one-half one day and the remainder the next. Common salt contains, beside the pure chloride of sodium, soluble compounds of lime and magnesia; these impurities it is desirable to remove, which may be done by saturating the whole with water sufficient to dissolve them, but not any considerable quantity of the pure salt, pouring off the liquid, and straining and drying the remainder in a clean cloth. In Ireland a mixture of one part sug-

or, one of nitre, and two of the best salt, is used instead of salt alone, at the rate of an ounce to the pound, and the flavor it imparts is very highly recommended. For the casks, wood entirely free of moisture is essential; and if the pyrogenous acid has been removed from it by boiling, it is all the better; if it remains in the wood it is liable to act upon the salt in the butter, converting it into brine. In packing, care is required to thoroughly incorporate each portion, as it is added to that already in the keg, so that no receptacles for air are left among the butter. The surface being made smooth, it is covered with a little salt and a cloth moistened in brine.—The quantity of butter contained in milk is very variable; some yielding not more than 3 pounds to the 100 of milk, and some instances being recorded of more than double this product. Dr. Muscati possessed an Alderney cow that gave milk so rich, that from 14 gallons, weighing 144 pounds, 10½ pounds of butter were obtained, being equal to 8.788 per cent. of the milk. From one cow of very good quality a fair average product of butter is one pound per day; but more than 3 times this quantity has been sometimes obtained for several weeks together. From the general run of cows the yield, however, is much less, varying with the pasturage and the feed. The flavor of the butter is more or less affected by the food of the cow, the taste of the onion and the turnip often being imparted to the milk and its products.—As butter is sold, it is sometimes found to be adulterated with a considerable excess of water and of salt. By the investigations of Dr. Hassall it appears that in the salt butter sold in the London market, water and salt are incorporated in quantities varying from 10 to nearly 95 per cent. of the weight.—The state of New York produces about ¼ of all the butter that is made in the United States. In 1855 the total product was 90,293,073½ lbs., of which Delaware and St. Lawrence counties produced over 4,000,000 lbs each, and Chautauque, Cheneago, Jefferson, Orange, and Otsego counties over 3,000,000 lbs. each. By the census of 1850, the product of butter in the state was 70,766,094 lbs. The total value of the butter produced in the United States in 1850 is estimated at \$50,125,000.

BUTTER TREE, a plant of the genus *baobab*, discovered by Park in the interior of Africa, which yields from its kernels, by pressure, a white, hard, and rich butter, which will keep a year without salt. Other species, which have the same property in a less degree, are found in India.

BUTTERFLY, the popular name of several families of insects of the order *lepidoptera*, undergoing a complete metamorphosis, having 4 wings, and a tongue changed into a suctorial organ; from the last character they come under the sub-class of *haustellata* of Fabricius. The term butterfly includes all the diurnal lepidoptera, or those which fly by day, of which the *papilionidae* are the principal family; the

other families, as given by Mr. Stephens, are *nymphalidae*, *iperaeidae*, and *hesperiidae*. The hirsutular and nocturnal lepidoptera will be noticed under the articles *HAW-MOON* and *MORP*. The order was named by Linnaeus from the Greek words, *lepis*, -ides (*scales*), and *ptera* (wings), indicating the characters peculiar to the wings, which are covered on both sides with imbricated scales or feathers, to the unassisted eye presenting the appearance of dust or powder, but under the microscope displaying an arrangement as uniform and characteristic of species as that of the scales of fishes and the feathers of birds. The beauty of this order has made them the special study of naturalists and the delight of collectors, so that their habits, metamorphoses, and structure are very well known; the most interesting and instructive points are connected with their metamorphoses, and these will be more fully alluded to under the article *CATERPILLAR*. In the *lepidoptera*, the parts about the mouth are changed into suctorial organs; the mandibles are very much reduced, and the *maxillae* are transformed, each into a semi-canal, extensible, and capable of being rolled up spirally, which, when united, form the suctorial organ (*lingua spiralis*); at the base of this organ are 2 very short maxillary palpi, between which and the hairy labial palpi it is sheathed when rolled up; this tongue, if it may be so called, is very long in the butterflies. In the caterpillar state these organs are masticatory and not suctorial, adapted for the food of these voracious larvae, while in the perfect insect the long tongue is necessary to obtain the liquid honey contained in the deep calyxes of flowers. In some species the anterior and lateral surfaces of the maxillae are provided with a considerable number of minute papillae, which are probably organs of taste as well as of exquisite touch. The eyes are compound. The abdomen has 6 or 7 segments, is attached to the thorax by a very small portion of its diameter, and has no sting nor ovipositor; the legs are 6 in number, each composed of 5 parts, and the tarsi with 5 articulations; in some genera the anterior pair are short and folded against the chest, and entirely useless as locomotive organs. The ventral nervous system consists of 7 ganglia, the first 2, the largest, belonging to the thorax; the connecting cords are single, except between the thoracic ganglia. In the caterpillars the ventral cord consists of 11 nearly equal ganglia; during the pupa state the 1st and 2d, and the 3d and 4th, are fused together, forming the 3 thoracic ganglia, which send off the nerves to the legs and wings; the 5th and 6th are also fused into one. Respiration is affected by means of *tracheae* extending through all parts of the system, and opening externally by *stigmata* on the sides of the body; the trunks arising from the stigmata open into two large lateral canals, from which the tracheae branch off. They have a well-marked urinary apparatus; the Malpighian or uriniferous tubes are usually 6 in number, long,

free, and open into the stomach by 2 excretory ducts; the tubes contain cells, disposed in rows, filled with very fine granules of a dark or brownish color; on the rupture of the cells, their contents pass into the stomach and digestive canal, and are either evacuated with the fæces, or separately as a troubled liquid; it is well known that they emit a considerable quantity of urine, when bursting from their pupa envelope. The two sexes are distinct, and the rudiments of the sexual organs exist in the youngest larvæ, though their development takes place principally during the pupa state; the females lay their eggs, which are numerous and varying in form according to the species, upon such vegetable substances as the larvæ are to feed upon; the time at which the eggs arrive at maturity coincides with the end of the pupa state, so that the sexes are ready to unite soon after they leave this state; this act accomplished, both sexes soon perish; the spermatic particles are filiform and very active. The wings are membranous and veined, and covered with an immense number of beautiful scales, varying in size, shape, and coloration, implanted by a small pedicle resembling the stem of a feather. An idea of the immense number and exceeding minuteness of these wing-scales may be formed from the fact that Leeuwenhoeck counted 400,000 on the small silk-worm moth; in a piece of modern mosaic work there may be nearly 900 separate pieces in an inch square, while the same extent of surface on a butterfly's wing may contain from 100,000 to 900,000; such is the wonderful superiority of nature's works to the finest specimens of human art. The life of the butterfly is a continued series of changes from the time of its leaving the egg till it becomes a perfect insect. As soon as the caterpillar is hatched it begins to eat eagerly, and increases rapidly in size during this larva state, changing its skin several times; before each change it ceases to eat, remains motionless, and sometimes attaches itself by a slight web to the under surface of a leaf; it gets rid of the old skin by various contractions of the whole body, which separate the dry and shriveled covering on the back, the insect escaping in the course of a few minutes; sometimes the internal lining of the alimentary canal, from the mouth to the extremity of the body, comes away with the skin; the latter takes place most frequently when the larva is about to change into a pupa, and often proves fatal. When the full-grown caterpillar is ready to assume the pupa, nymph, or chrysalis state (for these are synonymous), it ceases to eat, evacuates the intestines, and suspends its contracted body to the under surface of some object, either by its legs, head downward, or by a little rope of silk; after remaining suspended several hours, it changes its skin for the last time in the manner above alluded to; the legs, antennæ, and wings are extended along the body, and the whole is strengthened by the drying of the transparent

fluid which facilitated the separation of the skin. In the pupa state the insect does not eat, and remains perfectly quiet; the pupa of the lepidoptera is called "obtectod," because the future limbs are seen on the outside of the case. The duration of the butterfly in the pupa state depends much on external circumstances; if this condition happen in the hot period of summer, the perfect insect may appear in 8 or 9 days; it may be prolonged to 2 or 3 weeks, and may even exist during the whole winter; during this state the insect is in a condition like that of the hibernating animals, respiration and circulation being reduced to their minimum in the first part of its confinement, but becoming active toward the close. At the proper time the pupa case is burst open, and the perfect butterfly suspends itself with its new wings hanging downward; after these have become developed fully by active respiration and circulation, the insect remains at rest a short time until the external covering becomes hardened, forming the dermo-skeleton; it is then the perfect butterfly, which sips the honey from the flowers, reproduces, and dies.—The butterflies, properly so called, fly only during the day, and at rest usually hold their wings erect; the antennæ are terminated by a little club, or are filiform in a few genera; they are the only lepidoptera, a few moths excepted, in which the lower wings do not have a rigid bristle or fringe to retain the upper pair; their caterpillars have always 16 feet, and the chrysalis is naked, attached by the tail, and in general angular. Linnaeus comprised all the butterflies under the genus *papilio*, but Lafreille divided them into two sections, as follows: Section 1 contains all those which have a single pair of spines on the posterior extremity of the tibia, the wings perpendicular when at rest, and the antennæ usually club-shaped at the end, but sometimes filiform; this includes the genera *papilio* and *hesperia ruralis* of Fabricius, and is itself divided as follows: 1st, those in which the 8d articulation of the lower palpi is sometimes almost wanting, at others distinct, but as well covered with scales as the preceding one, and the hooks of the tarsi very apparent; some of them are 6-footed, all the feet formed for walking, and nearly the same in both sexes, and their chrysalis in addition to the common posterior attachment is fixed by a silken thread across the body, or enclosed occasionally in a large cocoon, and the central partition cell of the under wings is closed underneath; in the 4-footed species the chrysalis is simply attached by the tail; the caterpillars are elongated and almost cylindrical; 2d, those in which the lower palpi have 8 distinct joints, of which the last is nearly naked or with much fewer scales than the preceding one, the hooks of the tarsi very small and scarcely projecting, and the discoidal cell of the under wings open behind; the caterpillars are oval, or formed like the sow-bug; the chrysalis short, contracted, smooth, and attached by a silken thread across

the body. Section 9 is composed of species whose posterior tibiae have 3 pairs of spines, one at the end and the other above; whose lower wings are commonly horizontal when at rest, and whose antennae often coil in a bent point; the caterpillars, few of which are known, fold up leaves, and spin within this covering a thin silken cocoon, in which the chrysalis is developed, smooth and without angular projections.—Among the genera of the 1st division of section 1 is: *Popilio* (Latr.), remarkable for their elegant shapes and beautiful colors; these spotted with red on the breast Linnaeus called *epites Troes*, or Trojans, and those without the spots *Ichii*, or Greeks. They are found in the tropical and temperate zones of both hemispheres; the caterpillars, when touched, thrust forth from a slit in the 1st segment just behind the head a pair of soft horns joined together somewhat like the letter Y; these are scent-organs, giving out an unpleasant odor, and doubtless designed for their protection against flies and ichneumonae. Many have the under wings elongated, as the *P. machaon* (Linn.), a European species of large size, with yellow wings spotted and striped with black, the under ones having some blue spots near the posterior edge, one of which is like an eye with red at the internal angle; the caterpillar is green, with black rings dotted with red, and feeds on the leaves of the carrot, fennel, &c. Of the American species, one of the finest is the *P. asterias* (Oenamer.), whose wings expand about 4 inches; it is of a black color, with a double row of yellow dots on the back, a broad band of yellow spots across the wings, and a row of yellow spots near the hind margin; the lower wings are tawny, and have 7 blue spots between the yellow band and the outer row of yellow spots, and near the posterior angle an orange eye-like spot with a black centre; the spots on the under side are tawny orange. This species is very numerous in July, hovering over flowers, especially the sweet-scented phlox; in this and the following months the eggs are laid singly on various umbellata plants; the caterpillars have been found on the parsley, carrot, parsnip, celery, and other garden vegetables, to which they are quite destructive; they come to their growth toward the end of September, when they become chrysalids, in which state they remain all winter, being transformed into butterflies in May or June following. Another of our summer and beautiful species is the *P. yildesou* (Fabr.), with tailed greenish-black wings; the superior wings with 4 or 5 white spots on the margin, most conspicuous beneath; the lower wings highly polished green, with 6 pearl-white spots before the margin, beneath with a broad green border upon which are 7 large fulvous spots, each surrounded by a black ring, and marked by a lateral white spot, and about 6 small white dots on the inner edge; thorax black, breast dotted with yellow, abdomen green with a lateral double row of whitish dots; the female is the largest, with brown wings and coppery reflections. The *P. Tereus*

(Linn.), a common American species, somewhat resembles the *P. machaon* of Europe; the general color of the wings is yellow, bordered with black dotted with yellow, with 5 partial bands of black anteriorly; on the lower wings are 2 yellow bands to the black margin; the anal angle fulvous edged with white, with 2 or 3 green spots near it; the body above is black, with a yellow lateral line; breast yellow, with 3 oblique lateral black lines. In the mountainous regions of Europe and Asia is found the genus *Parassius* (Latr.), the females of which have a horny bent-shaped pouch at the end of the abdomen; the caterpillars make a cocoon of leaves united by silken threads. A well-known species in the Swiss valleys is the *P. Apollo* (Linn.), white, spotted with black, with white eye-like spots, edged with red on the lower wings; the caterpillar is velvety black, with a row of red spots on each side and one on the back. The genus *thus* (Fabr.) is characteristic of the south of Europe. In the preceding genera the lateral margin of the lower wings is more or less concave; in the genus *postis* these are dilated beneath the abdomen so as to form a groove. The butterflies of this genus are found in various regions of the globe, and are commonly seen flitting over the fields and moist places, mounting high in the air when they meet a companion; the caterpillar has no protruding tentaculum on the neck, and the chrysalis is suspended by a thread passed across the body. The genus *postis* includes the British cabbage butterflies, 8 or 10 species, of a white or yellow color and small size; the general color of the caterpillars is green, and in this state they are very injurious to the vegetable garden. In Massachusetts there is a white butterfly, *P. eleazar* (Harris), which hovers over the cabbage, radish, and turnip beds about the last of May or beginning of June, for the purpose of depositing its eggs; these are fastened, by the number of 3 or 4 on each leaf, to the under surface; they are hatched in a week or 10 days, and the caterpillars attain their full size in 3 weeks, about 1½ inch in length, and of a pale green color; they devour any part of the leaf; the chrysalis state lasts about 11 days, so that the perfect insects come out the latter part of July, and are ready to lay the eggs for another brood, the chrysalids of which survive the winter and come out in the following May. These butterflies fly low and lazily when about to deposit their eggs, and are easily caught in large numbers by a muslin net; the titmouse and other insect-eating birds devour the caterpillars with avidity. Among the 4-footed butterflies, one of the largest and handsomest genera is *Danaus* (Latr.), including the Fabrician genera of *euplex* and *idea*, in which the antennae are terminated by a club, the inferior wings rounded and not forming a groove for the abdomen, and the upper wings more or less triangular. *D. plexippus* (Linn.), a common and large North American species, is of a fulvous yellow color, with dilated black veins, black margin dotted with

white, especially in the superior angle of the upper wings; body black, with numerous white dots on the trunk; the larva is ringed with black and white, with 2 slender processes on the anterior and 2 on the posterior part of the body; the chrysalis is of a delicate green color, with golden dots; it feeds on different species of *asclepias*, and is abundant in the middle and southern states. In the genus *argynnis* (Latr.), the anterior feet are short and feeble, the under surface of the lower wings is often decorated with silvery and opaline spots, or yellow ones upon a fulvous ground, and the upper surface varied with red or orange, with spots or lines of black or brown; the caterpillars are beset with spines. In England, where there are several species, these butterflies are called fritillaries. The *A. Diana* (Cramer), of the southern states, though not one of the handsomest of the genus, is yet pretty from the contrast of the blackish and pale orange of its upper surface, and from the slender silvery lines of the under surface of the lower wings; its general color above is a dark brown, with a very broad fulvous exterior margin, with a few blackish spots and nervures. The genus *melitæa* was separated from the last by Fabricius, and is distinguished principally by the yellow spots and checkered appearance of the under surface of the lower wings, and by the larva, which is pubescent, with small fleshy tubercles on the body, which is not armed with spines. The *M. myrina* (Cramer) is a pretty little species found from Massachusetts to Florida, somewhat resembling the *M. selene* of Europe; the wings are fulvous, with black spots and undulated lines; below there are more than 80 silvery spots, and an eye-like spot near the base of the inferior ones. In the genus *vanessa* (Fabr.), the knobs of the antennæ are short and broad; the palpi are long, curving, and contiguous, and form a kind of beak; the wings are jagged or tailed on the posterior edges; the under side of the lower wings is often marked with a golden or silvery character in the middle; the caterpillars are armed with numerous spines, often live in company, and do not conceal themselves under a web or within a folded leaf; the head of the chrysalis has 2 horn-like elevations and a prominence on the back resembling a nose, presenting rather a grotesque appearance; in both sexes the anterior pair of feet are short and very hairy, and the 2 posterior pairs with double nails. Here belong the tortoise-shell butterfly (*V. urtica*, Linn.), and the following 3 other British species: the "Camberwell beauty" (*V. antiopa*, Linn.), with angular wings of a deep purplish black, with a yellowish or whitish band on the posterior edge, and a row of blue spots above; the "peacock's-eye" (*V. Io*, Linn.), reddish fulvous above, with a large eye-like spot on each wing, on the upper reddish surrounded by a yellowish circle, the under blackish surrounded by a gray circle, with some bluish spots, and under the wings blackish; and the "painted

lady" (*V. cardui*, God., more properly placed by Mr. Stephens in the genus *synthia*), with wings red above, varied with black and white, underneath marbled with gray, yellow, and brown, with 5 eye-like bluish spots on their edges. The following American species are worthy of mention: The antiopa butterfly (*V. antiopa*, Linn.), occurring, as has been seen, also in Europe; this butterfly passes the winter in some sheltered place in a partially torpid state; great numbers are sometimes seen crowded together in barns, apparently lifeless, with the wings doubled together over the back, but quickly becoming active on exposure to heat; it comes out very early in spring, often before the snow is off the ground, and may be seen sporting, with torn and faded wings, early in March in sheltered spots; the caterpillars despoil the poplar, willow, and elm of their foliage, on which they are found in great numbers early in June; they are black, with minute white dots, and a row of 8 brick-red spots on the top of the back; being nearly 2 inches long, and armed with spines, they were formerly supposed to be capable of inflicting dangerous wounds; the first brood is produced in June, and a second in August, which become perfect insects before winter. The semicolon butterfly (*V. interrogationis*, Fabr.) has the wings on the upper side tawny orange, with brown and black spots; lower wings generally black above, beneath reddish, or marbled with light and dark brown, and a pale golden semicolon on the middle, whence the name; the wings expand from 2½ to 2¾ inches, while those of the preceding are from 8 to 8½ inches; it appears in May, and again in August, and is seen till the middle of October in sunny places; the caterpillars live on the American elm and linden trees, and on the hopvine, to which they are very destructive; the spiny caterpillars are favorite receptacles for the eggs of the *pteromalus vanessa*, a tiny chalcidian parasitic insect of the order *hymenoptera*, which destroys great numbers of the chrysalids in whose bodies the little maggots come to maturity. Smaller species are the *V. comma* (Harris), and *V. progne* (Fabr.), which are much alike, expanding from 2 to 2½ inches, above of a tawny orange, the fore wings bordered and spotted with black, the hind wings blackish posteriorly, with 2 black spots in the middle, and a row of bright orange spots before the hind margin, the under side marbled with light and dark streaks, with a silvery comma in the former species, and a silvery L in the latter, on the middle of the hind wings; the caterpillars are very much alike, being pale yellow, with a reddish head, white spines tipped with black, and a row of 4 rusty spots on each side of the body; they are found on the American elm in August. The genus *nymphalis* (Latr.), or *apatura* (Fabr.), contains some very large and beautiful species; the anterior feet are useless for locomotion, and the abdomen is received in a groove formed by the dilatation of the lower wings; the caterpillars are less spiny than in the

preceding genera. The purple emperor of Europe, *A. iris* (Linna.), has very strong and black wings, and is capable of a high and long-sustained flight; instead of the singular motions of common butterflies, the species of this genus soar in a steady manner like a bird of forest trees, they are difficult to capture, and therefore highly prized by collectors; M. Godart has described more than 260 different species, some of which are found in this country. In the genus *scirpus* (Fabr.), peculiar to South America, the antennae are almost filiform; in this are included some of the most gorgeous of the lepidoptera. In the genus *Hyperboides* (Fabr.), or *elysian* (Latr.), the antennae and in sight knobby or elongated swellings; the anterior feet are short, the hind pairs with double nails, the internal margin of the wings emarginate to receive the abdomen, and the middle discoidal cell closed posteriorly; the caterpillar has no spines, but is downy, with the posterior extremity forked. It contains many species, the wings of which are often ornamented with beautiful eye-like spots; they frequent dry localities, over which they fly in a jerking and sudden manner. The *H. Andromacha* (Hübner), frequenting the southern and south-western states, has the wings brown, with submarginal blackish spots, beneath paler, with a series of eye-like spots. The *H. musalis* (Say), about 2 inches in extent of wings, is of a brown color, the lower wings marked below with black and white; it inhabits the highest summits of the White mountains of New Hampshire, and, according to Say, seems to be confined to that region.—In the 2d division of the 1st section are several small 6-footed butterflies belonging to the family of *Icemanidae*; the caterpillars are short and almost oval, with feet so short that they seem to glide rather than walk, and they secure themselves by the hind feet and a silken loop across their bodies. Here belongs the genus *oryx* (Lam.), which contains many small species of an azure blue color, variegated with black and white. The genus *oryxoides* (Latr.), belongs to America; *polyommata* (Fabr.) is named from the beautiful eye-like spots of the under surface of the wings, which are generally blue above in the males, and brown in the females. The genus *lycaena* (Fabr.) includes the splendid little species called "coppers" by collectors. According to A. and G. Speyer, the *lycaenidae* and *erycinidae* belong to the division of *Atropopoda*, in which the anterior legs are of a different form in the 2 sexes; in the latter, the males possess cleaning paws; in the former, the males want claws on the anterior tarsi, and the claw joint ends in a sharp point.—The 2d section of diurnal lepidoptera includes the family of *Ampericidae*, which frequent grassy places, flying short distances in a jerking manner, whence they are called "skippers" by English writers. The *lycaena matis* (Fabr.) feeds on the mallows, whose leaves it folds up, and in which it is changed; the wings are in-

dent, blackish brown above, with white lines and spots, beneath greenish gray with small irregular spots; the caterpillar is gray, with a black head and 4 yellow points on the first ring, which is narrowed; the chrysalis is black, slightly powdered with blue. In the genus *endemis* of Lr. Doubtful is the *E. Elyseus* (Fabr.) of this country; it expands from 2 to 2½ inches, and is of a general brown color; the 1st pair of wings with a transverse band and a few spots near the tip of a honey-yellow color; the hind pair with a short rounded tail, and a broad silvery band across the middle beneath. This large and handsome species appears about the middle of June, hovering over sweet-scented flowers; it flies so rapidly and strongly, that it is difficult to take it without injury; the females lay their eggs singly, on the leaves of the locust (*Robinia pseudacacia*) and *R. coccinea*; hatched in July, they roll themselves into a covering of the leaves, as a protection from the weather and birds; the full-grown caterpillar is about 2 inches long, of a pale green color, with transverse streaks of darker green, with a red neck and head; each lives in its own case, one end of which is left open for egress at night, at which time it feeds; they remain as chrysalids in their leaf cocoons during the winter; the viscid locust is sometimes completely stripped of its leaves by this caterpillar. Of the genus *arctia* (Fabr.), Mr. Swainson says the butterflies comprising it "are, perhaps, the most splendid insects in creation. No art can effectually represent the changeable and resplendent green which relieves the velvet black of the wings, and which varies with every change of light. The typical species are found in tropical America, where they fly with amazing rapidity, and perform, like their prototypes the swallows, annual migrations."—The butterflies are to insects what the humming birds are to the feathered tribes, the analogy holding good not only in their brilliant colors and manner of flight, but also in the nature of their nutriment, the honeyed juices of the flowers. The happy life of the butterfly, sitting from flower to flower, from one seasonal delight to another, resembles that of professed pleasure-seekers, the "butterflies of fashion," whose only object is enjoyment, whose existence is a blank, and whose lives add nothing to the progress of humanity; they are mere useless consumers of the products of other men's labors; a whole generation dies, and is deservedly forgotten. From the transformations of the butterfly, natural theology has drawn one of the most simple, beautiful, and convincing arguments for an existence beyond the grave. We see the airy, brilliant, perfect insect, derived from the crawling, disgusting, and voracious caterpillar—a worm transformed into a sylph—a change that no one, unless it had been actually seen, would believe possible. Rescued from analogy, this emblem of the butterfly has seemed typical of the change of the corruptible into the incorruptible after death; the proviling human desires are represented by the creep-

ing caterpillar; in the chrysalis we have presented to us the darkness and stillness of the tomb; and in the butterfly we recognize a new-born existence of the spirit, freed from the imperfections of the earthly and finite, and rejoicing in the pleasures of immortality.

BUTTERMILK, the liquid which remains after separating the butter from milk by churning. It consists of the thin portion of the milk with the caseine or curd intermixed and some butter oil. When cream is used for churning, the buttermilk is much richer than if the entire milk is employed, and does not so readily sour. Sweet buttermilk is much esteemed by many as a pleasant and nutritious drink. In Scotland it is brought into the cities for sale like other milk. It is used to some extent in the preparation of a very good quality of bread.

BUTTERS, in chemistry, the name given by the alchemists to certain salts, generally chlorides of the metals, which have the consistency of butter, such as butters of arsenic, antimony, tin, &c. The name is still retained in some of the pharmacopœias. In vegetable chemistry it is applied to fixed oils extracted from vegetable products, which at common temperatures concrete and become solid. Such are the oils of the nutmeg, cocoa, &c.

BUTES, a village of Switzerland, canton of Neuchâtel. Situated in a narrow valley, and surrounded by high mountains, its position is such that during many months of the year its inhabitants never see the sun. Pop. 1,200.

BUTTISHOLZ, a village and parish of Switzerland, canton of Lucerne. In its vicinity is a remarkable mound called Engländerhübel, or "Englishman's hillock." It is the grave of 3,000 Englishmen, followers of Enguerrand de Coucy, son-in-law of Edward III. and earl of Bedford. This nobleman, in the course of a quarrel with Leopold of Austria, began to devastate the Swiss cantons, when he was defeated by the peasants near Buttisholz, and a large number of his troops cut to pieces (1375).

BUTTMANN, PHILIPP KARL, a German philologist, born at Frankfort-on-the-Main, Dec. 7, 1764, died in Berlin, June 21, 1829. He finished his education at Göttingen, and in 1788 was appointed assistant librarian to the king of Prussia, but was constrained to turn schoolmaster in order to supply the deficiencies of his salary. Experiencing the want of a good elementary Greek grammar, he published, in 1792, a small one of his own composition, which during his lifetime went through 20 editions. In 1808, when the new university was opened in Berlin, he was appointed one of its first professors. He subsequently published an etymological and an intermediate Greek grammar. The latter has been translated into English by Prof. Robinson, and the elementary grammar by Mr. Edward Everett.

BUTTON, an article used for the fastening of clothing and for ornament. Buttons may be divided into 2 classes, those with shanks or

loops for fastening them to garments, and those without. The manufacture of these useful articles involves various processes, some of them very interesting, and varying according to the materials used. These are metal, horn, shell, glass, mother-of-pearl, jet, and whalebone, beside the woven stuffs which are employed for covering button moulds. Birmingham is the most noted place in the world for the manufacture of buttons. In this country it is extensively carried on in Waterbury, Conn., and in Easthampton, Mass. The principal manufactories in the latter place were established about 1849 by Samuel Williston and Co., who had previously owned similar establishments in Haydenville, in the same state. They give employment to 250 hands, consume annually \$75,000 worth of stock, and produce from \$175,000 to \$200,000 worth of buttons. Recently an excellent button has been made in New Brunswick from India-rubber. In the manufacture of gilt buttons, brass containing very little zinc is used. This is furnished to the button-maker in strips, out of which the disks are cut by a machine. This process is so rapid that one person can prepare about 12 gross in an hour. The preparing of the shanks is a distinct branch of trade. They are made of brass wire, a coil of it being put into a machine, in which one end is pushed forward gradually to a pair of shears, and the wire is cut off in small pieces. It is then bent, and being compressed between the jaws of a vice, forms an eye. A small hammer next strikes the two ends, flattening them, and rendering the shank ready for use. The labor of fastening these to the button is performed by women. When properly adjusted, a little solder and rosin are applied to the spot where the two come in contact, which melts on being heated, and on cooling firmly unites them. The buttons, after thorough cleansing, are now ready for being ornamented, either silvered or gilded, as may be desired. If the former, a mixture of silver in solution, salt, and cream of tartar, with some other ingredients, must be stirred together, and the buttons washed with this preparation. For gilding, great care is necessary. An amalgam of gold leaf and mercury is used. This is gently heated, poured into cold water, and then strained through wash-leather to remove the excess of mercury. The portion left in the leather is dissolved in dilute nitric acid, and applied to the buttons. (See GILDING.) To so great a degree of refinement was this art carried in Birmingham, that three pennyworth of gold was made to cover a gross of buttons. The thickness of the precious metal could not hence have exceeded the $\frac{1}{1000}$ of an inch. The next process is to free them from all the mercury by heat. For this purpose they are thrown into a wire cage within a furnace constructed in such a manner that the mercurial vapor is conducted into a vessel containing water, in which it is condensed. This is termed drying off. Burnishing completes the work. As the fashion of

button is constantly changing, new forms and new materials are always coming into use. Models covered with silk, velvet, etc., have of late in a measure superseded the silk buttons.

Buttons without shanks are made of simple disks of horn, wood, or other material, with holes drilled through them, by means of lathes, for the purpose of sewing them on.

BUTTON, THOMAS, an English navigator in the early part of the 17th century, was the successor of Hudson in exploring the N. E. coast of North America. He sailed in 1612 with 3 vessels, the Resolution and the Discovery, passed through Hudson's straits, and was the first to reach land on the western coast of the bay. The point which he touched was in lat. 62°, and was named by him Cany's Swan's Nest. Being obliged to winter in this region, he selected a position near the mouth of a river, first named by him Nelson's, after the master of his ship. Every precaution was taken against cold and icebergs, yet the severity of the climate occasioned much suffering to his crew, and was fatal to a few of them. During the next summer he explored and named several places on the coast of Hudson's bay, and advancing to the lat. 65°, became convinced of the possibility of the north-west passage.

BUTTONSWOOD. See **PLANT TREE**.

BUTTRESSES, props or supports on the outside to very tall structures, such as bridges which bear a heavy superstructure. In Gothic architecture a pilaster, pier, or masonry added to and standing out from the exterior of a wall.

BUTTS, the name of the hinges used for doors. These are cut out from strips of iron or brass in the form of 2 blanks of equal size, which by beading rollers are each turned over along a part of one edge, so as to form a cylindrical cavity for the insertion of the pin which holds them together, and on which the parts turn. The portion of metal which would have made the cylinder the whole length of the edge is cut out, that the 2 parts may fit into each other. By improved processes recently introduced they are now commonly made by casting melted brass or iron into the form above described, and the cast-iron is afterward commonly converted into malleable.

BUTTS, a central county of Georgia, bounded E. by the Ocklawaha river, watered by several creeks, and having an area of about 240 sq. m. It has a moderately uneven surface and a fertile soil. The productions in 1850 were 224,930 bushels of Indian corn, 51,230 of sweet potatoes, 24,000 of oats, 4,110 bales of cotton, and 1,540 lbs. of rice. There were 5 saw mills, 5 grist mills, 1 woollen factory, 2 tanneries, 12 churches, and 211 pupils attending public schools. The county was named in honor of Capt. Samuel Butts, an officer in the war of 1812. Capital, Jackson. Pop. in 1855, 6,858, of whom 5,076 were slaves.

BUTTERA, ALESSIO, an Italian poet, born at Malcesina, March 27, 1771, died in Paris,

Aug. 22, 1822. He was educated at Verona, and early made himself known by various poems, and also by his novel of "The Two Travellers." When the French revolution broke out, he became a leader of the French party in Italy, and received from Napoleon the appointment of secretary general of the congress of Venice. After the treaty of Campo Formio he removed to France, and became professor of the Italian language and literature at St. Cyr. Two years later he was appointed professor of history and belles-lettres at Mantua, and was subsequently employed in several political offices. He wrote a history of Venice and of Italian literature.

BUTYRIC ACID, one of a number of acids which are produced by the action of caseine in milk upon the sugar it also contains; lactic acid being first formed, and this by its decomposition producing butyric and carbonic acids and hydrogen. Its chemical formula is $C_4H_7O_2 + HO$. It is the substance which gives the rank smell to rancid butter. When obtained, as it may be from butter and from sugar, it is in the form of a clear, oily, volatile fluid. It combines with bases, and forms crystalline salts, which possess no taste. The compound of this acid and glycerine, also contained in butter, is called butyrine.

BUXAIL, or BAZAR, a town of British India, in the district of Shahabad, presidency of Bengal, situated on the south bank of the Ganges, about 60 miles below Benares. Pop. estimated at about 3,000. It is a large town, with houses built after the usual Indian fashion of mud and thatch, a few bungalows of somewhat better character occupied by Europeans, a good bazaar, and some handsome mosques. On an eminence near the river is a small fort, now dismantled. It is on the line of the railway under construction from Calcutta to Agra and Delhi. Bazar is celebrated for a victory, which confirmed the British in the possession of Bengal and Bahar, obtained, Oct. 23, 1764, by Major (afterward Sir Hector) Munro, with a force of 857 Europeans and 6,215 sepoy, over an army of from 40,000 to 60,000 men, commanded by Meer Cossim (or Cossim Ali Khan) and Sujah ud Dowlah, vizier of Oude. After an action of 3 hours' duration the Mogul force gave way, and was pursued by the British to a bridge of boats across a stream 2 miles from the field of battle. To save the bulk of his army and treasure, the vizier caused this bridge to be destroyed before the entire body had crossed, thus sacrificing 2,000 of his rear guard, but effectually checking the pursuit. The British loss was 847 men; that of the enemy amounted to about 4,000, beside 193 cannon.

BUXRÖWDEN, FRIEDRICH WILHELM, count, a Russian general of Livonian descent, born Sept. 14, 1750, at Magnusdal, died Aug. 23, 1811, at his estate of Lohde in Esthonia. He owed his first advancement to Count Orloff and to a rich marriage, after which he was engaged for many years against the Turks, and in Italy and Germany. In 1789 he

was made general, and in the next year conducted with success the campaign against the Swedes. He commanded a division of the army in the war against Poland, was in the storming of Praga under Suwaroff, was soon after appointed to the administration of Poland, and still later to the position of military governor of St. Petersburg. He was for a short time in disgrace and retired to Germany, but was restored to his offices upon the death of Paul I. At Austerlitz he commanded the left wing of the Russians, and in 1808 led a successful expedition against the Swedes.

BUXTON (Lat. *Bucostenum*), a market town and fashionable watering place of England, in the parish of Bakewell, Derbyshire, situated in a deep valley, 81 miles W. N. W. of Derby and 160 N. N. W. of London. Pop. in 1851, 1,235. It consists of a new and an old town, the former of which is the best built and contains the most interesting edifices. Its chief architectural beauty is the crescent, a range of buildings in the Grecian style erected by the 5th duke of Devonshire, in 1779-'86. They comprise hotels, a ball-room, a library, lodging houses, a bank, arcade, promenade, and a long range of stables with a covered riding gallery 160 yards round. Near by is the "Old Hall" (now an inn), where Mary, queen of Scots, once had her residence. It was built by the earl of Shrewsbury, to whom the custody of the unfortunate queen was intrusted by Elizabeth. The parish church is a modern edifice of great beauty. There are also several chapels, 2 schools, and fine public walks. The chief attraction of Buxton, however, is its mineral waters. They are celebrated for their medicinal virtues, particularly in cases of gout, rheumatism, and diseases of the digestive organs. They are saline, sulphurous, and charged with nitrogen. Their temperature is lower than that of the Bath waters, being about 100° F., and one of the wells has a double pump by which either hot or cold water may be obtained within a distance of a few inches from each other. There is also a chalybeate spring behind the crescent. Baths, both public and private, are numerous, and there is a charitable subscription fund, called the "bath charity," by which from 1,000 to 1,200 poor invalids are annually maintained for one month while using the waters. The fashionable season extends from June to October, and the town is then visited by from 12,000 to 14,000 persons. The vicinity abounds in charming scenery and has many natural curiosities. Half a mile distant is a large and remarkable stalactitic cavern called Poole's Hole, and not far off is the Diamond hill, so named from a profusion of crystals found in its soil which are sometimes dignified by the name of Buxton diamonds. The inhabitants are engaged chiefly in lime-burning and the manufacture of alabaster, spar, and other ornaments.

BUXTON, JEDEDIAH, an English mental calculator, born at Elmlton, Derbyshire, in 1705, died in 1775. He could not write, but possessed a great facility in performing mental arith-

metical calculations. He seemed unable to consider any thing save with respect to the number of its constituent parts. He heard a sermon, but remembered nothing of it except the exact number of words it contained, which he had counted. If the size of an object were named, he would instantly declare how many hairs'-breadths it contained. If an interval of time were stated, he would as rapidly state the number of minutes and seconds it was composed of. He scarcely had a system of calculation, as, from his own obscure explanation, his method was clumsy and circuitous, though the operation was extremely swift. He walked to London to have a sight of the king, and was examined by the royal society, who asked him: "In a body whose 8 sides are, respectively, 23,145,789 yards, 5,642,732 yards, and 54,965 yards, how many cubical eighths of an inch are there?" His reply, calculated at once without one figure having been written down, was found to be correct. When taken to see Garrick perform Richard III., he amused himself by counting the number of words spoken, and how many each performer uttered respectively. Except with respect to this mastery of numbers, his intellect was much inferior to that of ordinary men.

BUXTON, SIR THOMAS FOWELL, a British legislator and philanthropist, born at Castle Hedingham, Essex, April 1, 1786, died at his residence near Aylsham, Feb. 19, 1845. He received his education at Donnybrook, and subsequently at Trinity college, Dublin. At the age of 21 he married Miss Gurney; by this marriage he became brother-in-law to Mrs. Elizabeth Fry. In 1808 he became a clerk, in 1811 a partner, and soon after principal manager of the brewery of Truman, Hanbury, and Co., of London. Locally connected with the manufacturing district of Spitalfields, the sufferings of the poor inhabitants were so apparent to him that, in 1816, he took an active part in a public meeting, by which £44,000 was collected for their relief. Prison discipline also interested him, and, in conjunction with Mrs. Fry and Mr. Hoare, his brother-in-law, he personally examined into the state of British prisons, and published the result of his inquiry. From this came the prison discipline society, which led to the removal of many of the evils pointed out. From 1818 to 1837, when he was defeated by Mr. Villiers, Mr. Buxton was member of parliament for Weymouth. For this period of nearly 20 years, he was constant in his attendance, and a frequent speaker. Prison discipline, the amelioration of the criminal law, the suppression of lotteries, the abolition of Hindoo widow-burning, and the abolition of slavery, were subjects on which he was always earnest, and sometimes, from that earnestness, almost eloquent. He cordially cooperated with Mr. Wilberforce on the anti-slavery question, and succeeded him as recognized parliamentary leader of the party; Brougham, Lushington, Macaulay, Mackintosh, and other able liberals, strongly supporting him. He was a member of the legislature which, in 1833,

abolished colonial slavery, valuing £20,000,000 in compensation to the slave-owners. After his last parliament he employed his leisure in writing a book against the African slave trade. His last active part in public business was to participate in a meeting, held at Kotor last, in 1840, under the presidency of Prince Albert, which led to the expedition to the Niger in the following year. His memoirs, which include an autobiography, appeared in 1848, edited by Mr. Charles Boxton.

BUXTORF, JULIANUS, a German orientalist, born at Camen, in Westphalia, Dec. 29, 1564, died of the plague in Basel, Sept. 13, 1629. He was professor at Basel, and the most eminent oriental and Greek scholar of his day. His most important works are the Hebrew Bible with the rabbinical and unsectarian notes, a Hebrew grammar, and a Hebrew and Chaldean lexicon. He was a Calvinist.—**JULIANUS**, his son, born in Basel, Aug. 13, 1599, died there Aug. 16, 1654, succeeded his father in the chair of Hebrew at Basel, and occupied it for 34 years until his death. The same chair was filled by his son and his nephew successively during 68 years longer, making a combined occupancy of this professional chair by the Buxtorf family for an unbroken period of 140 years.

BUYUKDESEH, a little town on the western side of the Bosphorus, situated in the midst of a large, deep-bosomed valley. It is the summer residence of the Christian embassies at Constantinople, and its gardens and palace, not less than its natural beauty and coolness, make it a favorite promenade ground. A group of plane trees, the most splendid on the Bosphorus,—the Russian palace, distinguished by the regularity of its architecture, and the extensive gardens of Baron Hübsch, are particularly mentioned. The tradition that Godfrey of Bouillon encamped here with his army is not alluded to in the original records of the crusades.

BUZEN, a province of Japan, in the island of Kiu Siou. It is separated from Nippon by the strait of Van der Capellen, and comprises 24 islands, all unimportant.

BUZZARD (*Buteo*), the 4th sub-family of the birds of prey, *Falconidae*. Beak moderate, hooked from the base; tail equal. The buzzards agree with the hawks and falcons, sub-families 2 and 3, *Scipitridae* and *Falconidae*, in having the wings short, and the bill crooked from the base. They differ from them both, in having the bill somewhat longer and weaker, and wanting the tooth on the upper mandible, which is one of the principal distinctions. There is, however, some approximation to this tooth in the first genus, *Ictinia*, which has the edge of the upper mandible somewhat angularly serrated, or subdentulated, and the lower one distinctly notched. In the wings of the buzzards, the 3d and 4th quill feathers are the longest; in the falcons the 2d; and in the hawks the 4th. This sub-family is not numerous. It contains but 4 genera, *Ictinia*, *Circus*, *Perisoreus*, and *Buteo*. Of the first genus, *Ictinia*, there is

but a single species, the Mississippi kite, *I. plumbea*, which in manner, as in aspect and formation, approaches nearest to the true falcons, flying to a great height, where it remains poised or stationary for a considerable length of time, and again cleaving the air with rapidity in pursuit of the large insects, which, as well as birds and reptiles, form its prey. Its back and wings are slate-blue; its head and belly whitish spotted with brown; its iris fine red. The 2d genus, *Circus*, or harrier, contains several species: the meadow buzzard of Europe, *C. cyaneus*; the ringtail, *C. pygargus*; the hen harrier, *C. cyaneus*; the 2 last now generally supposed to be merely varieties of sex and age—both common to Europe, Asia, Africa, and America; the *C. melanoleucus* and *C. uirens* of Europe, and *C. vociferans*, *C. affinis*, *C. sociosus*, and *C. ferrugineus*, of South Africa. The genus *Perisoreus*, which is distinguished by having the lores, which surround the eye, feathered instead of naked, contains but one species, the honey buzzard, *P. apicivorus*; a gross misnomer, by the way, since the bird never touches the honey, although it feeds greedily on the larvae of the wasps and bees whose nests it violates and whose combs it steals, for the purpose of devouring their inmates. It is common to many parts of Europe, and to most oriental countries; but it is unknown in America and Australia. The genus *Buteo*, or buzzard proper, embraces several species, of which the common buzzard of Europe is the type. The chief characteristic is a bluish black bill, darkest toward the point. This bird is common in the far countries of North America and on the plains of the Saskatchewan. The other principal species are the rough-legged buzzard, *B. lagopus*, or hawk, peculiar to North America; the *B. borealis* of Hindostan and the banks of the Ganges; the *B. jacobus* and *B. tuchardus*, as also the *Buteo Lessonae*, of South Africa.—It is well remarked by Vigors, that of all the *Falconidae*, the sub-family of buzzards approaches nearest to the family of the owls, *Strigidae*. In their stealthy habits, their heavy flight, and indeed in their whole appearance, these contiguous groups evince a general resemblance, indicating a corresponding inferiority in the qualities which distinguish the birds of prey. The soft and loose texture of the plumage of both presents a similar affinity, and he adds that the *Circus*, or harrier, in particular, furnishes us with a still more intimate point of resemblance. The feathers that cover the cheeks and ears form, as he says, a sort of rounded collar that rises on each side of the face, thus exhibiting a conformity to the disk, or circular erection of the face feathers, so conspicuous in the owls. The buzzards seek their food late in the evening, and in that respect, as in their low, slow-sailing flight just above the tops of the long meadow grass, which they almost fan with their wings, as they seek in it their prey of small quadrupeds, such as field mice and ground squirrels, the inferior reptiles, newts, frogs, lizards,

and snakes, as well as the young of game, both winged and fur-bearing, among which they make sad havoc, all the varieties of this sub-family, except the Mississippi kite, which has, as remarked above, the high-soaring and sweeping flight of the falcons, closely resemble the owls. These birds must on no account be confounded with the American vultures, of which there are 2 species found in the United States, the *cathartes aura*, or turkey buzzard, as it is erroneously called, and the *cathartes atratus*, or carrion crow, as it is misnamed in the South. These birds are pure vultures, having the bare fleshy necks and carrion habits of that most disgusting class of birds, and do not bear the most remote resemblance, in figure, flight, or habits, much less in structural characteristics, to the family of buzzards, with which, through an almost universal blunder of nomenclature, they have been, it is to be feared, irrevocably confounded.

BUZZARD'S BAY, on the S. coast of Massachusetts, 80 miles long by a mean width of 7, contains the harbors of New Bedford, Fair Haven, Rochester, and Wareham. It is sheltered from the ocean, and separated from the Vineyard sound, by the Elizabeth islands.

BYLES, MATHER, a minister of Boston, of considerable note in the last century, and of a good deal of local and traditional interest in his native place to this day, born in 1706, died in 1788. He graduated at Harvard college in 1725, and, embracing the profession of the ministry, was ordained over the church in Hollis street, in Boston, in the year 1733, and obtained a distinguished position among the contemporary clergy. He was learned after the manner of those times, and was more addicted to literary recreations, and had a keener relish of the later humanities, than was then common among the members of his profession. To his reputation for solid learning and theological research he probably owed the degree of doctor of divinity, which was bestowed upon him by the university of Aberdeen in 1765. At that time these distinctions, now so common, were rarely enjoyed by American divines. As a proof of his recognized excellence in polite letters, we may accept the fact that he was the correspondent of some of the chief poets and authors of England. Letters from Pope and Swift were among the relics of his life which were preserved with pious care by his 2 daughters, who lived to an extreme old age. He was himself a votary of the muses in a small way, and a volume of his miscellaneous poems was published in 1744. He gave an early expression, too, to the loyalty which distinguished his character through life, in a poem on the death of George I. and the succession of his son, in 1727, when he was but 21 years of age. He also tempered the bereavement which Governor Belcher had suffered in the loss of his wife in 1784, by such consolation as an elegiac epistle could convey. It is not likely, however, that his name would have been preserved to this time,

had his reputation depended on the merits of his poetical effusions. The cheerful flow of his spirits, and frank gayety of his conversation, seem to have been something out of the common way, and to have left an enduring mark on the memories of that generation. His piety was tinctured with no asceticism. He was not one who refrained "when God sent a cheerful hour," and the lively sallies of his sprightly imagination, always kept within the limits of decorum, were restrained by no fear of injuring his personal or clerical dignity. Many of his sayings are still preserved in the popular mind, and probably many more are bestowed upon him to which he had no claim. They do not often rise above the dignity of the *paronomasia* or pun; but they have had the effect of amusing his contemporaries and making his name remembered. That his vivacious temperament, however, was not the effect of specific levity of character, was proved by the personal sacrifices he submitted to rather than be false to his ideas of public duty. During the heat and turmoil of the times preceding the revolution, and the political agitations, of which Boston was then the centre, he maintained his allegiance to the British crown with unflinching fidelity. However mistaken his ideas on this subject may now be esteemed, no one can doubt the sincerity of his loyalty, nor the high sense of duty under which he acted. After having been happily united with his parish for more than 30 years, his connection with it was dissolved in 1776, he being then 70 years of age, on account of his political opinions, and his utterance of them in the pulpit by prayers for the king and royal family. The next year he was denounced in town meeting as an enemy to the country, and subsequently arrested, held to bail, tried, and condemned to imprisonment in a guard-ship, and to subsequent exile. This sentence was afterward commuted, probably through the respect felt for his spirit and a kindly recollection of his humor, to confinement in his own house. This was carried into effect, and he was detained a prisoner in his house, with a sentinel before the door. This severity was soon relaxed for a while, and afterward renewed. One of the stories told of him is, that wishing to have an errand done at a distance, he asked the sentry to undertake it. The man objected on the ground that he could not leave the door unguarded; on which the doctor volunteered to be his substitute, and accordingly was seen by some one in authority, in powdered wig and cocked hat, with a musket on his shoulder, walking up and down before his house, keeping guard over himself. His release from custody soon followed, on which occasion, alluding to these changes of treatment, he said that he had been "guarded, regarded, and disregarded." Dr. Byles was of the Congregational order, which formed the staple of the ecclesiastical establishment of New England. Like most of his faith, remembering the persecutions which had left a hereditary grudge against the church

of England in the minds of the descendants of the Puritans, he had no very friendly feelings toward the establishment, or the officers it had sent forth into this country. When King's chapel, yet standing, was built in 1749, Dr. Byles was looking at the lower range of windows, which are small, deep, and nearly square. "I have often heard," said he, "of the excess of the church, but I never saw the port-*à-las* before." This may be taken as a fair average of the *mode* which have kept their place in the popular memory.—Dr. Byles spent the rest of his days in Boston, well respected even by those who most disapproved his politics, until he died at the age of 83. He retained his loyalty to the last, and bequeathed it to his 3 daughters, who lived in his house, then on the skirts of the town, but now not far from its territorial centre. Probably his Britannic majesty had no more loyal subjects in his dominions than these 2 ladies, who remained living monuments of the feelings, habits, and opinions of the last century until far into this. The survivor of the 2 died as late as 1837.—His son, MATTHEW, who began life as a Congregational minister, and was for several years settled in New London, Conn., became an Episcopalian in 1769, and was for several years rector of Christ's church, Boston. He left Boston with the Tories, and died rector of a church in St. John's, in 1814. He was a man of good parts and learning, and received the honorary degree of D. D. from the university of Oxford.

BYNG, GEORGE (Viceroy of Tangier), an English admiral, born in Wrotham, Kent, Jan. 27, 1663, died in London, Jan. 17, 1734, served in the British navy as midshipman until his 18th year, when he joined the land service. He was in the famous Tangiers regiment, in which, at the age of 21, he became lieutenant. Soon after he again joined the navy, and was severely wounded in a conflict between the Phoenix and a Chinese pirate in the East Indies. He was in Sir George Rooke's expedition and was made rear-admiral for his services at the battle of Malaga. Having been previously elected member of parliament for Plymouth, he was, in 1731, created Viscount Torrington, and finally raised to the office of first lord of the admiralty.

BYNG, JOHN, British admiral, born 1704, died March 14, 1757, 4th son of the preceding, known to posterity by the misfortunes which closed his life. In 1758, Minorca being menaced by the French, Admiral Byng was appointed commander of a squadron consisting of 10 ships of the line, with which he proceeded to its relief. After arriving in the Mediterranean, finding his equipments inadequate to the service required, he sailed for Gibraltar to get provisions and rest. He now learned that the French had succeeded in landing 12,000 men in Minorca, and had reduced nearly the whole of the island. A council of war agreed that relief would be impossible against the overpowering French fleet. Byng, nevertheless, did endeavor to establish com-

munication with the garrison, which, after an indecisive engagement with the French fleet, proved unsuccessful. For his conduct in this business he was superseded, and on his return home was brought to a court martial. After a long trial he was found guilty of cowardice in the presence of the enemy, and sentenced to be shot, but recommended to mercy. In spite, however, of all done in his favor, his political enemies prevailed, and, March 14, 1757, he was executed at Portsmouth. The unanimous verdict of posterity has acquitted Byng of the charge for which he was condemned, and has imputed to the ministry of the day the infamous crime of sacrificing him for the purpose of diverting popular odium from themselves for their inert conduct of the war. Byng might not have been the worthy successor of Blake or Anson, but his ships were unseaworthy, ill-manned, and worse equipped. His fault, at the most, amounted to excessive caution; but his unpopularity seconded the schemes of intriguers.

BYNKERSHOEK, ROSSMAS VAN, a Dutch jurist, born at Middelburg, in Zealand, in 1673, died April 16, 1748. His most important work, entitled *Observationes Juris Romani*, in which he investigates the origin, traces the progress, and delineates the character of the Roman jurisprudence, consists of 8 books, and was published in 2 parts in 1710 and 1733.

BYRD, WILLIAM, colonel, a distinguished citizen of Virginia, born about 1659, died in 1745. He received a liberal education in England, possessed one of the largest libraries in the colonies, and, having a large property, lived in a splendid style, unrivalled in Virginia. He was a member of the council in 1692. In 1699, when about 500 French Protestants arrived in Virginia, flying from persecution in France, he extended to them the most generous assistance. In 1723 he was one of the commissioners for establishing the boundary line between Virginia and North Carolina. He was a member of the royal society, and wrote for the "Philosophical Transactions" an account of a negro boy dappled with white spots.

BYRGIUS, JACOB, properly JOMES BUROR, a Swiss inventor, born at Lichtensteig, in Switzerland, Feb. 28, 1562, died at Cassel, Germany, 1638. He had great mechanical ingenuity, with talent for the exact sciences, and, in 1573, was invited to Cassel and attached to the observatory in that city. Having constructed a celestial globe which attracted the attention of Rudolf II., emperor of Germany, and having been invited by that monarch to enter his service, he removed to Vienna in 1604, where he continued to reside until the year preceding his death. He drew up certain tables, which were similar in those afterward published by Napier in his "Canon" of logarithms. Byrgius invented a number of useful instruments, among which were a sector and a pendulum clock; but the invention of this latter is attributed by some to a later period.

BYROM, JOHN, an English poet, born at

Kersall, near Manchester, in 1691, died in the latter city Sept. 28, 1763. His literary reputation depends upon his pastoral of "Colin and Phoebe," which appeared in No. 608 of the "Spectator," beginning, "My time, O ye muses, was happily spent." He was a graduate of Trinity college, Cambridge, a member of the royal society, studied medicine for some time in France, had his property withheld from him by his relatives on contracting a marriage of which they did not approve, and eked out for several years a precarious existence as a short-hand writer, until an estate devolved on him by the death of his brother. His works were published in Manchester in 1773, in 2 vols. 8vo, and a new edition, with an anonymous sketch of his life, appeared at Leeds in 1814.

BYRON, GEORGE GORDON NOEL, lord, an English poet, born in London, Jan. 22, 1788, died at Missolonghi, Greece, April 19, 1824. His father's family traced its origin back to the times of William the Conqueror, being descended from the ancient Norman family of Biron. On his mother's side he was related to the royal family of Scotland. His grandfather, John Byron, was a British admiral. His father, Capt. Byron, who led a life of such dissipation, that he obtained the name of Crazy Jack Byron, died abroad a few years after the birth of his son, after having deserted Byron's mother (Catharine Gordon), whose wealth he had squandered in such a degree as to make it necessary for her to retire with her son to the neighborhood of Aberdeen. He received the first rudiments of education at Aberdeen, and his mother placed him afterward in the school of Dr. Glennie at Dulwich. The death of his great-uncle brought him into possession of the title and the family-seat, Newstead abbey, in the county of Nottingham, and he was placed under the wardship of the earl of Carlisle, and sent under his direction, first in 1801, to Harrow, where the late Sir Robert Peel was among his classmates, and subsequently, in 1805, to Cambridge, where he rebelled against the authority of the university, and where poetry became his chief study. In his 19th year, on leaving Cambridge, he came out with his first public effort, "Hours of Idleness," which was severely handled by the "Edinburgh Review." In 1809 the poet hurled against his adverse critics a caustic satire, which, under the title of "English Bards and Scotch Reviewers," produced a strong sensation at the time, although Byron himself regretted its publication afterward. In 1809 he published "Imitations and Translations from the Ancient and Modern Classics, together with Original Poems." While still at Harrow he fell desperately in love with Miss Chaworth, whose father had been killed by Byron's great-uncle in a duel; but the lady married Mr. Musters, one of her older admirers. This exasperated the poet, and to drown his sorrow he plunged into dissipation. For some time he lived a life of revelry, and delighted in aquatic sports and kindred exercises, but from dancing he was

excluded by his lameness, an infirmity which was to him a constant source of mortification. His health, which was always delicate, suffered from his mode of life; his fortune, too, became deranged, while, above all, his restless disposition allowed him no repose. He took to politics for variety's sake, and having reached his 21st year in 1809 he was entitled to his seat in the house of lords, but his reputation had already sunk to so low an ebb that he found not one single peer ready to introduce him, according to the custom of that assembly, and he had to perform the ceremony himself. He took his seat on the opposition benches, and during his brief presence in the house he made speeches in behalf of the Roman Catholics and of the riotous weavers of Birmingham, which evinced but little talent for parliamentary oratory. He left England in 1809, and in company with his friend Mr. J. C. Hobhouse (now Lord Broughton), visited Portugal, Spain, and Greece, and gave a picturesque description of his travels in his "Childe Harold," which appeared in 1812. It was during this journey that he swam across the Hellespont. On his return to England he attracted much attention in society. His high descent, his interesting countenance, his chivalric bearing, his literary fame, the romance of his travels, combined to surround him with a prestige which fascinated the imagination of poetical ladies, who wore ribbons in his honor, while even more vigorous intellects felt disposed to pay homage to his genius. The enthusiasm rose high. His most servile admirers turned their collars down after his fashion, and Byron collars, knots, ties, came into fashion. Yet the whole nature of the man was so totally at war with English ideas of conventionality and propriety, that the conservative and prosaic portion of society kept aloof from him as they would from some fantastic reformer, while church people shunned him as they would a cannibal. In the public mind he was personally identified with his poetical creations, which, indeed, all bore more or less striking resemblance to himself. In rapid succession appeared the "Giaour," the "Bride of Abydos," the "Corsair," "Lara," "Parisina," the "Siege of Corinth," his "Ode to Napoleon," and various other effusions. On Jan. 2, 1815, he married Miss Milbanke Noel, a lady of considerable attainments, but as steadily governed by the dictates of common sense and of propriety, as he was wildly tossed about by the impulses of passion and imagination. He was separated from her in the subsequent year, after she had borne him a daughter, the Ada whom he loved poetically with the glowing devotion of his vehement nature. His separation from his wife produced a great sensation, the odium of which chiefly fell upon Lord Byron, who in 1816 left England for the last time, with the determination of never returning. Involved in pecuniary difficulties, and with a heart bleeding from a thousand imaginary and real wounds, Byron presented at that time a

perfect picture of war and despair. There was something too in his own gloomy reflections which pondered to the morbid workings of his imagination, and upon his own miseries he seemed at times to gaze with exulting delight. Of a gentle and generous disposition, he took a singular pleasure in attending as a physician, and while in this strange mood he travelled in his usual lordly manner over the most beautiful parts of the continent. Having spent the summer of 1810 in Switzerland, he afterward took up his abode at Venice, and subsequently at Ravenna, Pisa, and Genoa. While residing even in the Venetians by his dissipation, he would sometimes withdraw from his companions, and pass a night in study and conversation with the monks in the neighbouring cloisters. He lived at Ravenna in the most intimate relations with an Italian *vescovato* of his, the beautiful Countess Guiccioli, whose imaginative nature was attractive to the poet in the same proportion as the prosaic temperament of his wife had been unattractive. When the father and brother of Guiccioli, the counts Gamba, were expelled from Ravenna for political reasons, Lord Byron took the whole family under his protection, and removed to Pisa, whither the countess followed him. While here he lost his illegitimate daughter Allegra, and his friend Shelley, whose tragic end produced a deep impression upon his mind. In 1822, when the residence at Pisa, too, proved dangerous to the Gambas, he removed to Genoa, where they all remained until July, 1823, when his sympathy with the cause of Greece drew him to that country. In Greece he threw all the energy of his nature into the cause of Grecian liberty. He presented £12,000 to the Greek government, and organized at his own expense a brigade of Sulistas, his intention being to lead an expedition against Lepanto. But he failed to reconcile the jarring elements of Greece, or even to control the unruly disposition of his own soldiery. This want of success preyed upon his mind, and in February he was attacked with an epileptic fit. A few months afterward, while still in feeble health, he ventured out on horseback in a rainy day. Inflammation and death followed. His last words were: "My wife, my child, my sister!—you know all—you must say all." Public mourning was kept for him for 21 days in Greece, and his heart preserved in the museum of Miscologhi. Count Pietro Gamba subsequently escorted his remains to England, where they were buried near Newstead abbey.—After Byron's second departure from England, he published, beside the latter part of *Clara Harold*, the "Primer of Obillon," "Manfred," "Beppo," "Marino Faliero," "Don Juan," "Marino Faliero," "Sardanapalus," the "Two Foscari," "Cain," "Heaven and Earth," "Werner," the "Island, or Christian and his Comrades," and another poem.—Lord Byron was not successful as a dramatist. His plays contain fine declamation, but lack movement and action for the stage. In his poetry we find but little of

keen and true analysis of character. His heroines are creatures of the fancy, and bear greater resemblance to poetical beauties than to real women. His heroes are so many Lord Byrons in disguise. This concentration of individuality imparts a singular power and intensity to his characters. The glories of antiquity, great battles for freedom, popular uprisings against tyranny, Goethe and Napoleon, the sublime majesty of the Alps and the terrible splendor of Vesuvius—all things and men, thoughts and associations, grand and colossal—attracted in fires his tremendous imagination. But while his head was glowing with intoxicating imagery, his heart was that of a British peer, and with all his poetical sympathies for humanity and liberty, his pride of birth created a gulf between him and what he considered lower mortals. The poetical effusions of such a strangely blended and picturesque individuality could not but produce a strong impression upon the literary world. Especially to the young and the enthusiastic, there was an irresistible charm in his rouse. The magnificence of his presence, the glitter of his rank, the richness of his life, the circumstances of his death, coöperated powerfully to awaken interest in his behalf, not only in England, but all over Europe, and especially in Germany, where his morbid tone found many admirers and imitators.—He was succeeded in his title and estate by his cousin, George Arden Byron, born March 8, 1793, who is a rear admiral on the reserve list, and in waiting to the queen, and vice-president of the royal naval school. Beside his only legitimate child and heiress, Lord Byron left another daughter in Italy, to whom he bequeathed £5,000 on condition of her not marrying an Englishman.—Dowager Lady Byron, Baroness Wentworth (*Anna Isabella*), born May 17, 1792, was the poet's wife from Jan. 2, 1815, to Jan. 13, 1816, when the separation took place. Lord Byron gave the following description of her during the time of their engagement: "Yesterday a very pretty letter from Annabella, which I answered. What an odd situation and friendship is ours! without one spark of love on either side, and produced by circumstances which in general lead to abhorrence on one side, and aversion on the other. She is a very superior woman, and very little spoiled, which is strange in an heiress—a girl of 20—a poeess that is to be in her own right—an only child, and a *marriage* who has always had her own way. She is a poetess, a mathematician, and yet withal very kind, generous, and gentle, with very little pretension. Any other hand would be turned with half her acquisitions, and a tenth of her advantages." Lady Byron was the only daughter of Sir Ralph Milbanke Noel, and succeeded, Nov. 12, 1856, to the barony of Wentworth. She is noted for her mental attainments, and for her liberal disposition. In 1856 she sent \$350 to the New England Knave emigration society, and she figures frequently as a contributor to philanthropic en-

terprises.—Hon. **AUGUSTA ADA**, only child of Lord and Lady Byron—"Ada, sole daughter of my house and heart"—born Dec. 10, 1816, married, July 8, 1835, William King, earl of Lovelace, died Nov. 27, 1852. Ada inherited the restless disposition of her father; and although of good natural abilities, of a mathematical turn of mind, and excelling particularly as a chess player, she delighted in speculating in railway shares and on the turf. The insolvency of the attorney whom she employed disclosed the circumstances to her husband, who paid all her liabilities; but the unpleasantness which grew out of the discovery preyed upon her mind, and accelerated her death.

BYRON, JOHN, a British admiral, grandfather of Lord Byron, born Nov. 8, 1723, died April 10, 1786. While still very young he accompanied Anson in his voyage of discovery round the world, and was wrecked on the Pacific coast, and conducted by the Indians to Chiloe, where he remained till 1744. He was nicknamed by the sailors "Foul-Weather Jack," on account of the many hardships he had endured. In 1768 he commanded 8 ships of the line, and distinguished himself in the war against France. Subsequently he was employed by George III. on an exploring voyage between the Cape of Good Hope and the southern part of America. After touching at Madeira and the Cape Verd islands, he proceeded to Rio de Janeiro, and then sailed to the southern part of the Atlantic ocean, visited the Falkland islands, where he met Bougainville, who was founding a colony there, and subsequently directed his course northward to the island of Masafuero. Thence, sailing westward, he discovered the isles of Disappointment and King George's island, and directing his course northward, discovered 2 more islands, which he called Danger and Byron's islands. Sailing by the Carolines into the Chinese seas, he passed through the straits of Banca to Batavia, and in May, 1766, arrived in England. In 1769 he was appointed governor of Newfoundland. In 1778 he watched the movements of an armament sent out by France to assist the Americans. In July, 1779, he fought off Grenada an indecisive engagement with the commander of that French armament, Count d'Estaing, and on his return to England, withdrew from active service.

BYSSUS (Gr. *βυσσός*), a Scripture word variously translated fine linen and silk, and supposed by some to have been cotton, and by some the asbestos fabric. There appear to have been 2 quite different qualities of the byssus; one, the finest, used for the habit of the priests, and the other for that of the Levites. As now used, the term is applied to the hairy-like filaments that proceed from the base of the foot of certain molluscous animals, as the pinna and the mussel, and which serve, by being attached at the other extremity to rocks and other substances, to hold the animal in its place, and at the same time to allow it some motion. The name was also applied to a variety of obscure filamentous

plants that are now generally supposed to be the young shoots of different species of fungi.

BYSTROEM, JOHAN NIKLAS, a Swedish sculptor, born Dec. 18, 1783, at Philippstadt, in the province of Werneland, excels chiefly in the busts of women and children. In 1815, the king of Sweden, whose statue he had executed, presented him with a house and a studio, and gave him commissions for the statues of a great number of Swedish sovereigns, some of which adorn the public squares of Stockholm, others the royal palace. For the last 30 years he has officiated as professor at the Stockholm academy.

BYTOWN (name changed to **OTTAWA** in 1854), the capital of Carleton co., Canada West. It is situated on the Ottawa river, and connected by railroad with Prescott, and by the Rideau canal with Kingston. It is divided into an upper and a lower town, and contains a hospital, a nunnery, 4 branch banks, a telegraph company, 7 insurance agencies, printing offices, factories, machine shops, founderies, gas works, and about 50 stores. Five newspapers are published here, and the town is one of the most flourishing in Canada West. The value of assessed property in 1856 was \$3,800,000. A large trade, chiefly in lumber, is carried on by means of the river and canal. At the western extremity of the city are the celebrated Chaudière Falls, spanned by a suspension bridge, which unites Upper with Lower Canada. This town was designated by the home government, in 1858, as the future permanent capital of Canada. Pop. 10,000.

BYZANTINE EMPIRE, called also the Roman empire of the East, the Eastern empire, and the Greek empire. On the death of Theodosius the Great, A. D. 395, the division of the great Roman empire into East and West became permanent. The eastern portion, with Constantinople, the ancient Byzantium, for its capital, was bequeathed to the elder son Arcadius, with whom the line of Byzantine emperors properly commences. The Byzantine empire beginning A. D. 395, ended A. D. 1453, with the Mohammedan conquest of Constantinople. The Eastern empire at its inception consisted of 2 prefectures, namely: 1, the Orient, including 5 dioceses, Oriens (proper), Egypt, Asia, Pontus, and Thrace, and embracing all the Asiatic regions toward the Euphrates and independent Armenia, and the African coast west of Egypt to the great Syrtis; 2, the prefecture of Illyricum, with the two dioceses of Macedonia and Dacia, embracing the countries of the lower Danube, the whole of ancient Macedonia, Hellas, Crete, and the islands of the *Ægean*. In the Crimea, the Byzantines occupied the cities of Theodosia, Chersonesus, near Sebastopol, Eupatoria, and Dandaea. The line of demarcation between the empires of the East and the West was the Danube, from a little above Pesth down to where it receives the Drinus, and a line drawn from the town of Scodra, now Scutari, on the Adriatic, toward the great Syrtis off the coast of Cyrenaica in Africa.

Rufinus was guardian for the young Arcadius; after the overthrow of the former by Stilicho, the minister of the Western empire, the eunuch Eutropius, and later, Gallus, the murderer of Rufinus, succeeded in the premiership. During this period the Goths ravaged Greece. After the death of Gallus in a civil war excited by his ambition, the empire was ruled by the timorous and avicious wife of Arcadius, Eudoxia, till her death in 404. The young son of Arcadius, Theodosius II., succeeded to the throne in 408. Antemius administered the government for him until 416, and then his sister, the princess Pulcheria, became regent. Pulcheria assumed the name of Augusta, governed the empire ably, and excluded her brother from any participation in its administration. Under her sway a successful war was carried on against the Persians, and the Western empire was conquered by the Byzantines for Valentinian III., who ceded the provinces of Western Illyria, including Pannonia, Dalmatia, and Noricum, as a recompense therefor. On the other hand, Thrace and Macedonia were ravaged with impunity by Attila and his Huns, and Pulcheria was obliged to purchase peace by the payment of an annual tribute to the barbarians (448). The *Code Theodosianus* was drawn up in this reign. After the death of her brother, Pulcheria was called to the throne, 450. She was the first female who ever attained to this dignity. She gave her hand to the octogenarian senator Marcian, whose prudence and valor averted the attacks of the Huns from his empire. Shelter was given in this reign to the Germans and Sermatians, who fled before the Huns. Marcian persuaded Attila to wreak his thirst for bloodshed and desolation upon Italy and the West, instead of the East; yet the yearly tribute was raised by Attila from 500 pounds of gold to 2,000, and a piece of territory to the southward of the Danube was ceded to him. Pulcheria died in 453, and Marcian reigned 4 years after her death. Leo I., a Thracian of obscure origin, was appointed emperor (457-474). His expedition against the Vandals was unsuccessful. His coronation by the patriarch of Constantinople is said to be the earliest example of a consecration by the Christian clergy. Leo helped the Romans against the Vandals, and enjoyed great popularity and influence at Rome, which extended even to nominating their rulers. His grandchild, Leo II., aged 8 years, was his successor, but died shortly afterward. Zeno the Isaurian (474-491) succeeded him. Basiliscus drove him away from his capital in 475, and made himself emperor. At this period a fire took place which consumed the library of Constantinople, containing 120,000 manuscripts, the treasures of classical literature. By the help of his fellow-provincials, Zeno regained the throne in 477. In his reign serious and bloody disputes arose about the nature of Christ between the Monophysites and the orthodox. Zeno sided temperately with the latter, and issued the *Henoticon* (482), which re-

stored an outward harmony to the church. He protected his empire against Theodoric and his Goths by presents, and by recommending them to march upon Italy (478). At his death, his widow Ariadne married, and raised to the throne, Anastasius the minister (491-518). A new enemy appeared in the Bulgarians, against whom he protected the peninsula in which Constantinople lies by building across it the celebrated "long wall," 12 miles in length. His favorable disposition toward the Monophysites caused formidable insurrections against his rule. After his death, Justin I., a Thracian, and commander of the body-guard, was nominated emperor by the soldiers (527-527). He adopted his nephew Justinian as his heir. He persecuted the Monophysites, and received the powerful support of the orthodox clergy. Justinian I. succeeded him (527-565). Under the reign of this emperor, the Byzantine empire attained the summit of its glory. The general Belisarius overthrew the empire of the Vandals, and acquired the whole of northern Africa to the Mediterranean, repelled the Persians at the Euphrates, conquered Sardinia, Corsica, and the Dalmatic Isles (533), and defeated Constantinople against the Bulgarians. Nurses followed up the victories of Belisarius, destroyed the Ostrogothic power in Italy in 555, and restored Italy and Sicily to the sceptre of Byzantium. Italy was governed by a Greek exarch, whose residence was Ravenna, the last capital of the former emperors of the West. Industry flourished, the silk culture was introduced into Europe, civilization progressed, and intellect developed itself, in the long reign of Justinian. The code of civil law, then drawn up, has been ever since a leading authority among the jurists of all civilized nations. The race-course factions of blues, greens, reds, and whites, now acquired a dangerous license. As the emperor sided with the blues, the greens rose in tumult, and were only put down after committing fearful ravages in the capital. The Monophysite quarrel also agitated the empire. In 560 the consular government of the capital was abolished, and about the same period the last schools of the pagan philosophers in Athens were shut up by imperial command. His successor was the unfortunate hen-pecked Justin II. (565-578). The Lombards wrested from the Byzantines a large part of Italy (568); Justinus was unsuccessful against the Persians, and the Avars plundered the provinces on the Danube. The Byzantine government in this reign allied itself for the first time with Jesabool, khan of the Turks, beyond the Caspian sea, against their common enemy, the Persians, and received an ambassador from him. Tiberius II. reigned 578-582. He purchased peace from the Avars, and was fortunate against Chosroes I. king of the Persians. His general, Mauritius, who gained his victories for him, was appointed his successor, or the Cæsar. Flavius Tiberius Mauritius reigned 582-602. He reinstated Chosroes II. upon

the throne of Persia, after that potentate had been driven away by his subjects, and made an advantageous peace with him. His army mutinied as he was marching against the Avars, who had increased the tribute payable to them by treaty. The soldiery elected Phocas as his successor, and the "green" faction of the metropolis rose and murdered Mauritius and his sons. Phocas reigned 602-610. The people grew weary of his tyrannical rule, and called to their aid the governor of the imperial præfecture of Africa. The governor sent his son, Heraclius, who took Constantinople, and Phocas was torn in pieces by the multitude. Heraclius was made emperor (610-641). The Persians conquered from him Syria, Palestine, and Asia Minor, and pressed him so hard that he thought of leaving Constantinople forever, and making Carthage his capital. From this step he was dissuaded by the patriarch, and between 622 and 627 he had recovered all, including the holy cross which Siroes, the Persian monarch, had taken as booty from Jerusalem. In 626, the Avars made an unsuccessful attack upon Constantinople. From this time forth we hear nothing more of the wars between the Byzantine empire and the Persian monarchy. The Arabs now appear as the most formidable foe of the Greeks. The Saracens conquered the country bordering on the Euphrates, Syria, Judæa, and all the Byzantine possessions in Africa, 635-641. The Byzantines were weakened by their intestine religious controversy about Monothelitism, or the one will of Christ. In Servia and Croatia a number of Slavonic kingdoms arose, which soon threw off all dependence upon the empire. Constantine III., son of the preceding, died soon; his step-brother, Heracleonas, lost his throne by an insurrection, and was banished. Constans II. became emperor (642-668). In his reign the empire lost Cyprus and Rhodes (650) to the Saracens, and suffered defeat at the hands of the Lombards in southern Italy. Constans became the victim of a conspiracy at Syracuse, in Sicily, where he was endeavoring to protect the coasts and islands of the Mediterranean from the Saracens. He published the *Typos*, an edict intended to quiet the controversy between the orthodox and the Monothelites. Pope Martin I. condemned the edict, and was thrown into prison by the eastern emperor. He was succeeded by his son, Constantine IV., Pogonatus (668-685). In 672 the Moslems besieged Constantinople by sea for the space of 5 months. They were forced to retire by the terrible Greek fire, which set their vessels in a blaze. They repeated the attempt seven years in succession, with the like result. On the other hand, the government was compelled to pay tribute to the Bulgarians, who had conquered and founded a kingdom in ancient Messia. Justinian II., Rhinotmetus, or shorn nose, succeeded his father (685-711). His tyranny brought about an insurrection which cost him his nose and ears and an exile to the

Crimea. During his exile, Leontius and Tiberius III., two generals, reigned. Justinian returned and was assassinated. With him the race of Heraclians became extinct. Philippicus Bardanes, his general, succeeded him; next came Anastasius II., whose troops mutinied as he was leading them against Soliman. He resigned his authority and took refuge in a cloister. Leo III., the Isaurian, reigned 717-741. He beat back the Arabs from Constantinople, but not until after they had ravaged Thrace. The image controversy now became violent. Leo sided with the innovators, and ordered the removal, and afterward the destruction, of all images in the churches. This Iconoclasm roused the island population of the Cyclades to revolt, but Leo repressed the sedition. This position of Leo weakened the Byzantine power in Italy, and the year 728 saw the last of the exarchate of Ravenna. His son Constantine V. succeeded (741-775). He was as much of an Iconoclast as his father, and a more fortunate general. The dislike between him and the monks was mutual. He shut up many of the monasteries and convents, because he alleged that the inmates were sluggards and corrupted the people. He reconquered from the Arabs a part of Syria and Armenia, and destroyed their fleet off Cyprus. In 759 he drove out of the Peloponnesus 200,000 Slavonians, and wound up his successful career by victories over the Bulgarians. Leo IV., Chazar, son of the preceding, reigned 775-780.—The boundaries of the empire were well maintained against numerous foes. Constantine VI. succeeded under the guardianship of his mother Irene. She was an image-worshipper, and assembled the second council of Nice, whereat 370 bishops condemned the Iconoclasts. Eventually she put out her son's eyes (797), and reigned in his stead. She now desired to marry the new emperor of the West, Charlemagne; but this idea of reuniting the Eastern and Western empires was so repugnant to the popular opinion, that an insurrection took place which ended in her dethronement (802). Nicophorus, the high treasurer, was proclaimed emperor. He made a treaty with Charlemagne, which constituted the free territory of Venice as the limit of the 2 empires, became tributary to Haroun al Rashid, and fell in an engagement against the Bulgarians (811). To him succeeded Stauracius and Michael I. They fought unhappily against the Bulgarians. Leo V., the Armenian, a reputable general, succeeded (813). Orunnus, king of the Bulgarians, devastated Thrace, took Adrianople, and laid siege to Constantinople, when a sudden death surprised him. Leo then drove the barbarians back and forced them to a 30 years' truce. He ruled ably, but his dislike to the use of images raised up enemies and cost him his life (820). Michael II., the Stammerer, reigned 820-829. In 824 the Saracens in Spain took away from the empire the island of Crete, and in 827 the Aglabate Saracens seized Sicily. The same reign witnessed the loss of Dalmatia to the

Bulgarians. The public-spirited Theophilus, son of the preceding (829-842), fought long and bravely against the Arabs, but on the whole, fruitlessly. After some reverses he died of grief, leaving Constantinople much strengthened and embellished. He favored the Iconoclasts. His son, Michael III., succeeded (842-867), at first under the guardianship of his mother Theodora. She put an end forever to the Iconoclast controversy, by the restoration of images which was ratified by the third council of Nice (842). In his reign the Russians first appear as enemies of the empire, and the patriarch Photius quarrelled with the pope, Nicholas I., and laid the foundation for the separation of the eastern and western churches. The Manichæans and Paulician schismatics were persecuted. After Michael came Basil I., the Macedonian (867-886). He founded the Macedonian dynasty, which lasted until 1056. In 877 he published a compilation of laws, completed by his son, which, under the name of *Basilika*, governed the jurisprudence of the empire. In foreign relations he beat the Saracens in the East, and crossed the Euphrates triumphantly, protected Dalmatia and Ragusa from the Agabites, and reestablished the Byzantine power in Apulia and Calabria, which the Saracens had occupied. On the other hand, the Saracens completed the conquest of Sicily by the capture of Syracuse, and ravaged Peloponnesus. Leo VI., the Philosopher, son of the preceding, reigned 896-911. He was an author, and a patron of the arts and sciences; but his reign was disastrous in a military point of view. He called in the aid of the Turks against the Saracens; this showed the former the way into the Byzantine empire, and they captured the island of Samos for themselves. In the same way, Leo called in the aid of the Hungarians against the Bulgarians. The Russians appeared before Constantinople with a large fleet, but effected nothing. The Lombard dukes took from the Byzantines the greater part of what remained to them in lower Italy. The Arabs took Thessalonica, but were driven back by Ducas; Leo then sent an army into Asia, which penetrated into Mesopotamia, and achieved no advantageous peace. After Leo came his son Constantine VII., Porphyrogenitus (912-959), in partnership with Alexander, who soon died. His mother, Zoa, then administered affairs, and protected the empire from the Bulgarians for 7 years. Romanos Lecapenus (919) then obtained a share in the government, and brought along with him his 11 sons. They fought against the Bulgarians, Hungarians, and Russians. In 944 they were obliged to retire and give place to the empress Helen, who governed while her husband Constantine studied. At this period Russian and Hungarian princes came to Constantinople, were baptized, took Byzantine women in marriage, and spread Christianity in their native lands. His son, Romanus II., succeeded (959-963). Greece was recaptured from the Saracens

by Nicephorus Phocas, the emir of Haleh was forced to pay tribute, and the Russians were driven back. Nicephorus I., Phocas, succeeded (963-969), after marrying Theophanu, the widow of Romanus. He was defeated in Sicily, but recaptured from the Saracens Syria and Cilicia, and the island of Cyprus. His wife had him murdered, and gave her hand to his successor, the victorious general, Joannes Zimisces (969-976). He fought victoriously against the Arabs in Asia Minor, and against the Russians and Bulgarians in Europe. He extinguished for a time the political independence of the latter. His successor, Basil II., son of Romanus, reigned 976-1025. For 11 years he was occupied in combating 3 rebellious generals, Bardas Phocas and Bardas Scheraz. In 1018 the Bulgarian kingdom was annihilated and Bulgaria became a Greek province, and remained so until 1186. It was he who put out the eyes of 15,000 Bulgarian prisoners and sent them back to their king, who fell down dead at the spectacle. Constantine VIII., his brother, reigned 1025-28. They followed in succession Romanus III. (1028-34), and Michael IV. (1034-41), both husbands of Zoa, the daughter of Constantine VIII. Michael V. succeeded, and was driven out by the people because he would not marry Zoa. In 1042 Zoa and her sister, Theodora, were joint empresses, until Zoa married Constantine IX. (1042-54). During this period the Russians, Petchenegs, and Arabs ravaged the empire. The Seljuik Turks appeared as formidable enemies, and the Norman adventurers wrested from the Byzantines all their remaining possessions in lower Italy, except the city and territory of Otranto. After Constantine, Theodora again became empress (1054-58). In 1054 occurred the total separation of the Greek from the Latin church. With Michael VI., Stratiotikos (1057), the Macedonian dynasty became extinct. Isaac Comnenus, the first of the Comneni, reigned 1057-59. To him succeeded Constantine X., Duca (1059-67). The Seljuik Turks invaded the empire on the east and south, and the Scythian Uzes on the north. The latter were defeated. Romanus IV., Diogenes, reigned 1067-71. He defeated the Seljuiks under Alp Arslan in 2 campaigns in Cilicia and Cappadocia, but in the 4th was taken prisoner. During his absence Michael VII. was proclaimed emperor (1071-78). The Saracens and Seljuiks invaded the empire. The latter conquered almost all Asia Minor. Michael resigned, and his successor, Nicephorus III., a Botaniates (1078-81), had a stormy reign, troubled by numerous rival claimants to the imperial dignity. His general, Alexis Comnenus, dethroned him, and reigned 1081-1118. His administration is remarkable for its relations to the western crusaders. Robert Guiscard, the Norman duke of Calabria, advancing the claims of his relative Michael VII., defeated Alexis in Epirus; but he gained brilliant victories over the Petchenegs and the Kumani. The encroachments of Mohammedan

power, and the dangers that threatened all Christendom therefrom, now drew the attention of western Europe to this complication of affairs. The Turks had invaded Bithynia, and Alexis called the courts of the west to his aid. Pope Urban II. authorized the preaching of the first crusade. The first host of crusaders left an unfavorable impression upon the Byzantines. With the second a treaty was concluded. Alexis was to furnish a number of troops, and the crusaders were to hold the provinces reconquered from the Moslems as fiefs of the empire. Neither party kept faith. Bohemond, prince of Antioch, laid siege to Dyrrachium, but shortly afterward concluded a peace with the emperor. His son, Joannes Comnenus, succeeded him (1118-'43). He fought victoriously against the Seljuok Turks in 1120, and reconquered many towns. He defeated the Petchenegues, who had crossed the Danube, and the Hungarians. In 1131 he recaptured lesser Armenia. He was succeeded by his son, Manuel Comnenus (1143-'80). He was victorious over the sultan of Iconium, and over Raymond of Toulouse, the Christian prince of Antioch. In 1147 a new army of crusaders arrived at Constantinople, to the consternation of the inhabitants. In 1142 Manuel conquered the island of Corfu from the king of Sicily, in retaliation for an invasion of Greece by the latter. Between 1180 and 1183, reigned Alexis Comnenus II., son of the preceding, and Andronicus Comnenus. Andronicus was the last of the Comneni. Isaac II., Angelus (1183-'95). In his reign the king of Sicily undertook the conquest of the Byzantine empire, but was eventually beaten back by Isaac. The Bulgarians recovered their independence (1186). He was dethroned by Alexis III. (1195-1203). Isaac's son, Alexis the Young, supplicated the aid of the crusaders, then assembled at Venice, and obtained it in return for a promise to pay 200,000 marks of silver. The crusaders captured Constantinople, July 18, 1203, and restored Isaac, who with his son was put to death the next year. The crusaders again captured the city, April 9, 1204, and a short period of confusion ensued, during which a number of persons were emperors for a few months or days. The Latin empire of Romania was established (1204-'61), and Count Baldwin of Flanders elected first emperor. The European possessions of the empire were divided into 4 parts: 1. The imperial domain, including one-fourth part of the city of Constantinople (the other 3 parts being divided between the French and Venetians). Thrace, some castles on the Asiatic coast, the islands at the mouth of the Hellespont, and the suzerainty over the feudal dependencies of the empire. 2. The kingdom of Thessalonica was carved out for Boniface, marquis of Montferrat, which included Macedonia and a part of Greece. 3. The republic of St. Mark's obtained the coast lands of the Adriatic and the *Ægean*, a portion of the Morea, many of the Cyclades and Sporades, the islands of

Crete and Negropont, and the territory of Gallipoli on the Thracian Chersonese. 4. Many other fiefs were given to French knights, of which the principal were the duchy of Athens and Bœotia, and the principality of Achaia and the Morea. The Greek empire still survived in Asia Minor. Theodore Lascaris, who had been elected emperor by the senate in Constantinople, established his capital at Nicæa, whence the Greek empire of Nicæa received its name. It consisted of Bithynia, Mysia, Ionia, and part of Lydia. On the southeastern shores of the Black sea, from Sinope to the river Phasia, the Grand Comnenian empire of Trebizond arose. The Comnenian princes, Alexis and David, declared their independence at the fall of the old Byzantine empire, and one of their successors assumed the imperial title. In Epirus and *Ætolia* Theodore Angelus established a Greek principality. Returning to the history of the principal fragments of the Byzantine empire, we find that the Greeks called in the aid of Joannes, king of the Bulgarians, who defeated Baldwin and took him prisoner. Henry, brother of Baldwin, succeeded him (1206-'16). He fought with equal success against Lascaris, emperor of Nicæa, and brought the king of the Bulgarians to terms. He gave honors and offices of trust to the Byzantines, and protected them against the oppressions of the Latin clergy. Peter de Courtenay succeeded him (1216-'21). He was captured by Theodore, independent prince of Epirus, in a vain attempt to take Dyrrachium for the Venetians. His younger son, Robert, succeeded him (1221-'23). During his reign, Joannes Vatatzes, the Greek emperor of Nicæa, and Theodore, the prince of Epirus, reduced the territory of the Latin emperors of Romania almost to the peninsula on which Constantinople stands. John de Brienne, titular king of Jerusalem, next took the reins of power as regent for Baldwin II. (1228-'37). The Bulgarians made an alliance with the emperor of Nicæa and threatened the existence of the Latin empire. John de Brienne saved Constantinople, and the allies turned their arms against each other. Baldwin II. then reigned unaided (1237-'61). He implored men, arms, and money of the potentates and nations of the West, but they made no adequate response to his entreaties. The consequence was that Michael Palæologus, emperor of Nicæa, with the help of the Genoese navy, which was driven to the Greek alliance by hatred of Venice, obtained possession of Constantinople, July 25, 1261. The Genoese were rewarded by liberal mercantile privileges. The Latin empire of Romania now vanished, although many of the Latin principalities, such as the duchy of Athens, survived until the final downfall of the restored Byzantine empire in the 15th century. With Michael Palæologus (1261-'82) commenced the dynasty of the Palæologi, which endured until the Turkish conquest. By his endeavors to reunite the

Greek and Latin churches he gained the hatred of his clergy and people. Andronicus II, his son, succeeded (1282-1328), and immediately restored the Greek ritual. To defend his empire against the Turks, he took into pay a body of Catalan troops (1298), the Catalans beat back the enemy, and then began to pillage Greece and settle down upon estates got and held by the right of the sword. He abdicated in favor of his grandson, Andronicus III, (1328-41). He fought unsuccessfully against the Turks, who took Nicea and Nicomedia in 1399, and plundered the coasts of Europe, and made a barren alliance with the pope, the king of France, and other western powers, against the Moslems. His son, Joannes V., succeeded him, and reigned 1341-'81. It cost him a civil war of 10 years to rid himself of his guardian, Joannes Cantacuzenus. During this war the Turks first acquired territory in Europe. Gallipolis was seized by them in 1357; in 1361, Sultan Amurath took Adrianople, and made it his residence. Joannes appealed to the pope to aid him in his extremity, offering to resigne the eastern with the western church, but to no purpose. In 1379, Amurath conquered Macedonia and part of Albania, when Joannes signed a treaty, acknowledging himself to be the vassal of the sultan, and covensenting to pay tribute. Philadelphia, the last possession of the Byzantines in Asia, capitulated to Bajazet, successor to Amurath. When the sultan ordered that a Mohammedan call should reside in the ancient metropolis of Christendom, and that the emperor's son should accompany him in his wars, Joannes Palæologus died of a broken heart. Manuel, son of the preceding, escaped from the court of Sultan Bajazet, where he was a hostage, at the news of his father's death, and was proclaimed emperor (1391-1425). Bajazet laid siege to Constantinople, but raised it to levy war upon the Hungarians, returned in 1397, but made peace through fear of another western crusade. In 1400 he made a third attempt upon the metropolis, but the invasion of Tamerlane, which threatened the existence of the Turkish empire, recalled Bajazet into Asia, and saved the Byzantine empire for a space. Manuel recovered some lost ground while the sons of Bajazet were quarrelling. Yet, in 1423, Sultan Amurath II. appeared before the walls of Constantinople, and employed cannon, for the first time in eastern wars. Another fraternal quarrel on the part of the Turks brought about the return of peace. Joannes VI., son of Manuel, succeeded (1425-'42). Seeing that he was unable to defend his empire from the Turks, he endeavored to effect a reconciliation between the eastern and western churches, on the condition of a new western crusade in his favor. For this purpose he was present at the council of Ferrara, which was presided over by Pope Eugenius IV. The reunion was solemnly proclaimed there, but it did not take effect in the East. In 1444 Sultan Amurath reduced the Byzantine empire to the city and suburbs of

Constantinople, and out of generosity allowed the emperor to end his days in peace, on condition of paying tribute. His brother, Constantine XI. (1448-'53), was the last of the Byzantine emperors. He made a last appeal to the princes of the West, and to the prince of Georgia, whose daughter he had married. The western potentates were too much wrapped up in their narrow jealousies of each other to feel anxious upon any question which had only a general interest for them. Giovanni Giustiniani, a Genoese nobleman, with 2,000 Genoese and Venetian auxiliaries, and 4 Genoese ships of war, were the sole results of Constantine's appeal. The total garrison did not exceed 8,000 soldiers. The Turks appeared before the walls of Constantinople on April 6, 1453, with an army of 400,000 Moslems. They were not able to break the chain which protected the entrance of the harbor, but Sultan Mohammed II. had his fleet carried on rollers 10 miles overland, and launched into the inner gulf. Both sides fought bravely, but after a siege of 55 days, Constantinople fell on May 29, 1453. Constantine died heroically in the breach. The city was delivered over to rapine, and the bulk of the inhabitants sold into slavery. The brothers of Constantine, Demetrius and Thomas, held out for a short season in the Morea, which was taken by Mohammed II. in 1463. The rest of the Latin principalities, which had acknowledged a loose feudal subjection to the Byzantine emperor, had all fallen by 1460. The island of Lesbos was taken in 1462. David, the last of the Comneni, and the last emperor of Trebizond, submitted, 1461. Thus perished an empire which had kept the light of letters and civilization burning, though attacked by a hundred fires, through all the night of the dark ages, when western Europe, including even Italy, lay prostrate at the feet of barbarian conquerors, and was a howling waste, in which the law of the strongest alone prevailed.—The Byzantine empire was divided for administrative purposes into prefectures, dioceses, and themes or provinces. The power of the emperor was absolute. The emperor claimed to inherit the rights of the Roman emperors, and to be the lawful ruler of the West. He was anointed and crowned by the patriarch of Constantinople. As has been seen, the influence of women, favorites, and the clergy, was great. The ceremonial of the Byzantine court was carefully elaborated, and rigidly maintained. The consulate became extinct in the 9th century, and the senate and the last forms of municipal self-government in the 10th. The emperor was advised by a council of state, in which none found admittance except at his pleasure. The functionaries of government were divided into many classes, as at present in Russia, and each class had distinctive privileges. Eunuchs enjoyed high rank, and to them was intrusted the immediate attendance upon the holy person of the emperor. The major *domes* of the East was called first *circulator*, and afterward *protospatharius*. The

body-guard of the emperors began in the 10th century to be composed of Germans, Saxons, and Northmen. The latter were called Varings. The commandant of the fleet was the *mezas duz*.—The original sources of Byzantine history are the Byzantine historians themselves, who wrote in corrupt or later Greek. Only a few of these have been translated into any of the modern languages. Of the authorities in the modern tongues, we cite Le Beau, *Histoire du Bas Empire*, also translated into German; Zinkeisen, *Geschichte Griechenlands*; Fallmeayer, *Geschichte des Kaiserthums Trapezunt*; Gibbon's "Decline and Fall of the Roman Empire;" Finley's "History of Greece and Byzantium" (London, 1854), the most recent and best authority in the English language on this period; and for the Latin settlement in the East, Buchon's *Histoire des conquêtes et de l'établissement des Français dans les états de l'ancienne Grèce* (Paris, 1846). Du Cange's work in Latin, *Historia Byzantina* (Paris, 1680), was, before Gibbon's work, the only authority generally consulted. An interesting new work on the Byzantine empire, is Muralt's *Essai de chronographie Byzantine* (St. Petersburg, 1855).

BYZANTINE HISTORIANS, a series of little read but important lower Greek authors, who wrote between A. D. 893 and 1453, the era of the capture of Constantinople by the Turks. Of these, Procopius is the best known, and is the only one who has been translated into English. Anna Comnena, daughter of the emperor Alexis I., who wrote a history of her father's reign in 15 books, is also well known. A collection of the most important of them was made and published at the expense of Louis XIV., in 36 volumes (Paris, 1648-1711). The title of this work is *Corpus Scriptorum Historiarum Byzantinæ*. The Greek text is accompanied with a Latin translation and notes. The editors of this work were the Jesuits Labbé and Maltrait, Pétau and Poussines, the Dominicans Goar and Combefis, Prof. Fabrotti, Charles du Cange, Allacci, the librarian of the Vatican, Banduri, librarian at Florence, Boivin, the royal librarian at Paris, and Bouilliaud, a mathematician. Another edition, with additions, was published at Venice in 23 volumes, 1729-'33. Some, not included in either collection, have been published separately since. Niebuhr entertained a high opinion of the value of the Byzantine historians in a general history of mankind, and projected a new edition of them, which was commenced in 1823, under the title *Corpus Scriptorum Historiarum Byzantinæ, Editio emendatior et copiosior* (Bonn). This edition has been in progress of publication continuously since that time, and is not yet completed. Bekker, the two Dindorfis, Schopen, Meinecke, and Lachmann, are the principal editors.

BYZANTIUM, a city on the shores of the Bosphorus, founded by ancient Greek colonists on a part of the site of the modern Constantinople. It was originally settled by a band of

Megarian colonists, 658 B. C., but it was destroyed by Otanes, the Persian satrap, in the time of Darius Hystaspes. After the defeat of the Persians at Plataea (479 B. C.), Pausanias, the general of the confederate Greeks, re-colonized it with a body of Dorians and Ionians. From this heterogeneous constitution endless disputes arose, and Spartan and Athenian parties always existed within the walls. The fine harbor and advantageous position soon made it of great commercial importance. It obtained possession of the corn traffic between the shores of the Euxine and Greece and Egypt, and its fisheries were so abundant as to procure for the harbor of Byzantium the name of the Golden Horn. It remained under the regency of the Lacedæmonians until Cimon captured it for the Athenians. It soon returned to its original allegiance. Alcibiades, the Athenian, got possession of it by the aid of the Athenian party within the city, 408 B. C.; but it was retaken by Lysander, the Lacedæmonian, 405. Xenophon, with the remnant of his 10,000 men, passed through it on his way homeward. In 390 B. C. Thrasylbulus expelled the pro-Lacedæmonian oligarchy, and established the power of the democracy. Byzantium put itself at the head of a league consisting of Rhodes, Chios, Cos, and Caria, with a view of throwing off the Athenian supremacy. This they effected, and Byzantium remained for a space entirely independent. As the commercial importance of Athens declined, that of Byzantium was augmented. When, however, Philip of Macedon besieged it, it returned to its Athenian allegiance, and called upon the parent city for succor. Owing to the anti-Macedonian eloquence of Demosthenes, the aid was granted. Phocion, the Athenian, compelled Philip to raise the siege. The grateful Byzantines erected a monument in honor of the event, and granted the rights of Byzantine citizenship to the Athenians. During the progress of this siege, the city was saved from capture by surprise, by a flash of light which illumined the northern horizon and betrayed the proximity of the besiegers. A crescent was stamped on the Byzantine coins in honor of this miraculous event, and when the Turks took Constantinople in the 15th century, they adopted this municipal symbol as their own national device. In the reign of Alexander the Great, Byzantium acknowledged the Macedonian supremacy. In the dissensions of Alexander's generals, Byzantium sided with Antigonus against Polysperchon, and with Lysimachus against Seleucus. It was at this period much exposed to the incursions of the Thracians, Scythians, and other barbarians on the land side. The Gauls made it pay heavy tribute, which caused the citizens to retaliate upon the commerce of the world, by levying a toll upon all vessels passing through the Bosphorus. This tax brought them into a war with the island of Rhodes, 221 B. C. Attalus, king of Pergamus, sided with the Byzantines; Prusias, king of Bithynia, with the Rhodians. The latter were successful, and commerce remained unbur-

desol. Ancient writers give a very bad character to the Byzantines. Their morals were not above the standard of other large seaport towns. They preferred the sound of a flute to that of a war trumpet, and when Philip of Macedonia was besieging the place, the Byzantine general, Leo, found that the only means of maintaining the courage of the Byzantines, and holding them to their duty, was to plant a range of cook-shops along the ramparts. Byzantium was fortunate in allying itself with Rome from the first against the Macedonian kings, Antiochus of Syria, and Mithridates of Pontus. In acknowledgment of its fidelity, the Romans allowed it to remain a free confederate city. In consequence of some popular disturbances, the emperor Vespasian deprived the citizens of their civic liberties and sent them a governor. On being remonstrated with, he answered that the citizens had "forgotten how to be free." In the civil war between Pescennius Niger and Severus, Byzantium sided with the losing claimant. The emperor Severus besieged the town, which defended itself for 3 years, and then capitulated from famine. The chief citizens were put to death and the massive walls razed to the ground. Subsequently he repented of this severity, embellished the town, and gave it the name of Augusta Antonina, in honor of his son Antoninus. Caracalla restored some of its former civic priv-

ileges, but Gallienus gave it up to pillage and massacred many of the citizens. The inhabitants repelled the invading Goths in the time of Claudius II. Byzantium was the last refuge of Licinius in his war with Constantine. After the surrender of the city to Constantine, he resolved to build a new city on the site of the old, and make it the capital of the Roman empire. Thus Byzantium merged into Constantinople. A. D. 850. Diocletian and others gave the old city a circumference of 40 stadia.

BEOVICUS, ARMAND (Pol. *Beowski*), a Polish scholar and divine, born at Proszowice, near Mieschow, in 1667, died Jan. 31, 1697, in Rome, where, at the request of Pope Paul V., he spent several years of the latter part of his life in the Vatican, as librarian of the *Verginia del Urcino*, and actively engaged in literary pursuits. He was a member of the order of the Dominicans, one of the most voluminous writers of his age, gained for himself a high reputation as professor of philosophy and theology at Milan and Bologna, and crowned the labors of his life by continuing the celebrated ecclesiastical annals of Cesar Baronius, who had left them off at the year 1198, and completed only 12 volumes. He also carried them to the year 1582, in 8 volumes, from the 13th to the 21st volume, which were published first in Bologna and afterward in Rome.

C

C the third letter in the English alphabet, but, as it is in the Latin, and in those of all the modern European languages. Its form is derived by Scaldier from the Greek *καρρα* (κ), by dropping the upright stem, and rounding the *κ* into C. Suidas calls it the Roman *καρρα*, and Montfaucon, in his *Palaograpbia*, gives several forms of the *κ* which approach nearly to c. Others derive it from the Hebrew *קפא* (ק), which has nearly the same form, but is inverted, since the Hebrews and Latins read in opposite directions. Others, from its position in the alphabet, derive it from the Hebrew *קפא* (ק), and make its affinities with the Coptic *καρρα*, the Ethiopic *קפא*, and the Russian *קпавъ*. In the early Latin language C held the place which is now occupied by G, as appears from the inscriptions on the Trajanic columns raised in the Roman forum about 200 B. C., in which we find *maiestratus* for *magistratus*, *lecionus* for *legionis*, *pacenado* for *pugnando*, and *expositus* for *effugiant*. Thus Ausonius says, *pacinus vice fractus prius C*. The C also sometimes represented the Greek *καρρα*, since in the same inscriptions *Carthaginiensis* occurs for *Karthaginiensis*; but this function was more frequently fulfilled by the letters *γ*; thus the Greek *καρρα*, *καρρα*, *καρρα*, became the Roman *gac*, *gucquerus*, and *gucquerulo*. The tendency of the western language has been to soften the oriental articulation, and the *gemma* or C, after being softened by

being brought forward in the mouth to the front palate, and becoming K phonetically, superseded the *γ* which had been common in old Latin words. The Latins made no further phonetic change of C, always during the most flourishing period of their literature pronouncing it like a *καρρα*. If they had given the sibilant sound of C in the enunciation of the word Cicero, the Greeks in adopting the word would have written it with a *σ*. Modern languages, however, have carried the process on further. The English has softened the aspirated C (ch) in *church*, *chime*, *cherry*, and the French still more in *chacalerie*, *chaise*; while the unaspirated C has become a pure sibilant, as in *circle*, *cent*, *cycle*. Thus the English *touch* comes from the Latin *doctus*, and the English *place* and the French *plaisir* from the Latin *placere*. Some words, however, have not followed this phonetic change from the original pronunciation. Thus the modern Scottish kirk still embalms the sound of the old English church. Kindle and candle show that the pronunciation of cinder is perverted, and the people of north-western France still preserves the hard sound of C in *cheville*, and so links it to the English *come*. But though the Latins did not soften the C to a sibilant, they did worse. Having aspirated it into K, they next dropped it, preserving only the aspirate to mark the hiatus, as *trasto*, *trabo*; *berdano*, *berdano*; and this same process is noticeable in the en-

nate languages; thus *collum* (Lat.), *Hals* (Ger.), *halter* (Eng.). In French the phonetic softening of the O is traceable in the word *Karolus*, till the 9th century, then *Carolus*, and afterward *Charles*; and the comparatively modern use of the cedilla records the further progress of the change. O is also interchanged with some other letters beside the Q and K with which it is cognate; as with P in *pepo*, *coquo*, cook; *columba*, *palumba*; while *prox(c)imus* has supplanted *prosimus*, but not *prope* and *propius*. The phenomenon of the disappearance of O occurs in *sacramentum* (Lat.), *serment* (Fr.); *lacrima* (Lat.), *larme* (Fr.); and in many other cases for purposes of euphony. As a numeral, O signifies 100, OO 200, and so on. It was used among the Latins to stand for Cæsar, Caius, Cassius, *centum*, and *condemno*; and on account of the last use it is called *litera tristis* by Cicero. OO stood for *calumnias causa* or *concilium cepit*; *cos*, for *consules*; OI. for *Claudius*; O.V. for *Centum Viri*; and O.R. for *Civis Romanus*. An Italian O stands for *canto*. In French, a single O stamped on money marks it as the issue of the mint of Caen, and OO as the issue of the mint of Besançon.—O, in music, the name of one of the notes of the scale. It is the tone with which the so-called natural scale begins, and was designated by Guido *ut*, a name subsequently changed to *do* by the Italians. O is considered the key note, and its pitch is regulated by tuning forks. It is also a character used for the signification of time.

CAABA, or KAABA, properly a quadrangular structure, applied particularly to a celebrated temple at Mecca. According to Mussulman tradition, the first Caaba was built by the angels on the model of the pavilion which surrounds the throne of the Most High; the second was built by Adam, with whom it was removed to the skies, where it still exists in a right line above the Caaba of Mecca; the third was built by Seth, but perished in the deluge; the fourth, which now exists, was built by Abraham and Ishmael. The name is specially given to a small cubical oratory in the temple in the centre of a large space surrounded by galleries. This is the point toward which the prayers of all Mussulmans are directed. On one of its sides is intertwined the famous oval black stone, believed to be one of the precious stones of paradise, and to have been brought by the angel Gabriel to Abraham, when he was constructing the Caaba. At first of a dazzling whiteness, it has grieved and wept so long for the sins of the human race that it became gradually opaque, and at length absolutely black. It is an object of profound veneration to the pilgrims who resort to the sacred city. This inner Caaba is surrounded with a veil of black silk, and is opened but 8 times a year. The temple of the Caaba is older than the time of Mohammed, previous to whom it was the Arab pantheon, and contained all the idols of the nation.

CABAL (Fr. *cabale*), a word signifying club or association, imported into the English lan-

guage after the restoration. The ministers of Charles II. of England, whose names were Clifford, Ashley, Buckingham, Arlington, and Lauderdale, were called by some opposition wit the cabal ministry, as the initials of their names, ranged in the order given above, form the word cabal.

CABALA. This word is of Hebrew origin, and signifies reception, and in Hebrew literature it designates the religious and philosophical doctrines which the Jews say Moses received by divine communication on Mount Sinai, and which he afterward delivered traditionally to Joshua, and Joshua handed down in the same manner to the 70 elders. This system of doctrines was also called Masora (tradition), because it was given or transferred. It was not allowed to be written, that is, in the form of direct statement. It is supposed, however, to be enigmatically embodied in all the Old Testament or Jewish scriptures, especially in the Pentateuch. So highly do some comparatively modern writers (as Henry More) value the traditional science, which is supposed to underlie the Pentateuch, that they pronounce the latter a foolish and melancholy conceit, unless there be some key by which a higher but secret meaning may be extracted from it. Cabala is also used to designate a period in the progressive development of Jewish literature, which commenced about A. D. 800; also to designate a sort of divining by means of passages of Scripture, but this is a corruption of the term, and constitutes no part of the Jewish idea of the Cabala.

CABALLERO, FERMIN AGOSTO, a Spanish statesman, born July 7, 1800, at Barajas de Melo, in the province of Cuenca. He first settled as an advocate in Madrid, but on the subversion of the constitution in 1824, he retired to Estremadura until the death of Ferdinand VII. in 1833, after which he edited the *Boletín del Comercio*, which was suppressed, but reappeared under the new name of the *Eco del Comercio*. He was elected to the cortes, where he was a leading member of the opposition to the ministry of Martinez de la Rosa. Soon after he was a supporter of Mendizabal, and favored all the innovations attempted by that minister, especially the suppression of convents. He was a member of the constitutional convention in 1837.

CABANIS, PIERRE JEAN GEORGE, a French physician and philosopher, born at Cosnac, in the department of Charente Inférieure, June 5, 1757, died at Rueil, near Paris, May 5, 1808. He was the son of the barrister Jean Baptiste Cabanis de Salagnac, who married a very rich lady, and became an eminent agriculturist. Having left the bar to superintend the culture of his wife's extensive domains, the father became intimate with Turgot, the economist, who was then the administrator of Limoges, and afterward became the celebrated minister of Louis XVI. The son, though very intelligent, was a wayward student, and made but little progress in his early studies at Brives. At the

age of 14 his father took him to Paris, where he employed 2 years in reading the works of ancient philosophers, the writings of the fathers of the church, and those of modern philosophers, such as Rousseau and Voltaire. Locke was a particular favorite with the young philosopher. His father wished him to return home at the end of 3 years, but Mouski, the prime-bishop of Wilna, then in Paris consulting French philosophers on the best method of representing Poland, took an interest in young Cabanis, and engaged him as his secretary. After remaining 2 years in Poland, Cabanis returned to Paris, where Furgot introduced him to Mrs. Helvétius and her brilliant circle of society at Anteuil, and where he afterward became acquainted with D'Alembert, Diderot, Condillac, Franklin, Jefferson, Baron d'Holbach, and other men of eminence. He also became intimate with Boucher the poet, author of the *Ames desoires*, and undertook to translate Homer into French verse. His father wished him to choose a profession, and his health being very delicate, he was anxious to study medicine. He became the pupil of Duberuil, and followed his new studies with the same impetuosity he had always manifested in his favorite pursuits. In 1783 he received his degree of doctor of medicine. When the revolution broke out in 1789, Cabanis espoused the popular cause. He became the physician and the friend of Mirabeau. In 1791 he published an account of the illness and decease of the great orator. At a later period, during the stormy wranglings of the convention, Condorcet obtained privately from Cabanis, his friend, the poison he intended to take, in order to avoid a more violent death. He also expressed a desire that Cabanis would collect his writings, and expedient their publication. Cabanis married Charlotte Grouchy, the sister of Field Marshal Grouchy, and of Mrs. Condorcet. In 1789 Cabanis published his "Observations on Hospitals." In the year III. of the republic (1795) he was appointed professor of hygiene at the central school, and professor of clinical instruction at the medical school. He had much to do with the reorganization of medical instruction in the schools of Paris, Montpellier, and Strasbourg. In 1797 he published his reports to the council of 500, on the organization of medical colleges, and a paper on the "Degree of Certainty in Medical Science." He also published a paper on the "Revolutions of Medical Science." In these papers he developed the first germs of his system. "The active principle of life and movement in animated bodies," says Cabanis, "which Stahl calls the 'soul,' is oxg, but it acts diversely in the organs according to differences of structure and of function. It digests in the stomach, breathes in the lungs, secretes bile in the liver, and thinks in the brain." The "vital principle" or animating force of Stahl, adopted as the leading doctrine of medical science by the Montpellier school, had much influence on the mind of Cabanis, although his sys-

tem led to opposite conclusions. "Moral and moral science," says Cabanis, "have a common basis in the science of the physical organization of human nature. We must look to physiology for the solution of all their problems, and the common basis of all their truths. All ideas, sentiments, and passions, goodness and virtue, are derived from physical sensation. The source of all morals is in the human organization or physical organism, on which depend our faculties and modes of feeling." Condorcet had explained all the actions of the soul by sensation; Cabanis wished to complete this system of philosophy by investigating and explaining the origin and nature of sensation. "All sensibility resides in the nerves, and therefore," says Cabanis, "all the moral affections and intellectual faculties reside in the nerves. Impressions are received on the peripheral nerves and carried to the nervous centres, where they excite thought, feeling, and reason in the organism. Distinctions between physical and moral nature are therefore vain, the moral faculties having their origin in the physical." Such was the reasoning of Cabanis.—Being a friend of Shyris, he was noticed by Napoleon Bonaparte on his return from Egypt, and on the day after the 18th Brumaire, Cabanis, in the name and on behalf of the legislative assembly, wrote the proclamation recommending the French nation to accept the revolution which had just been accomplished. Under the consulate he was named a member of the senate; but, disappointed by the reactionary policy of Napoleon, he withdrew from public life, and devoted his attention exclusively to science. Being a member of the Institute of France, he had already read several portions of his work, "On the Relations between the Physical and Moral Nature of Man," to that learned body; and, in 1802 he published the work complete in 2 vols. 8vo, under the title of *Rapports de physique et de moral de l'homme*. The style being clear and brilliant, and the ideas consonant with the prevailing notions of the day, the book had great success in France, when first published; but the philosophy which it attempts to establish on the basis of the physical organism, and the identity of nervous matter with sensation and the vital principle, has lost its hold on the public mind. Cabanis himself, before he died, had modified his views on many points; and in a private letter to a friend, published by Bérard of Montpellier, 24-years later, wrote an excellent essay on "Primary Causes," in which he states that it is impossible for human reason to conceive the possibility of the existence of the universe, without the idea of intelligence as a first cause in the government of events.

CALARRUO, or CAPARRIA, a south-western county of North Carolina; area, 350 sq. m.; pop. in 1850, 5,747, of whom 1,085 were slaves. The surface is uneven, and in some places mountainous; the soil of moderate, but not uniform fertility. It is watered by branches of Rocky river, an affluent of the Yadkin. It

produced gold in the early part of the present century; but its wealth now is chiefly in live stock, grain, cotton, and tobacco. In 1850 it produced 418,820 bushels of Indian corn, 76,946 of wheat, 2,844 bales of cotton, and 408 lbs. of tobacco. It had 14 corn and flour mills, 8 saw mills, 1 woollen and 1 cotton factory, 7 tanneries, 21 churches, 8 academies, and 2,619 pupils attending public schools. Value of real estate in 1856, \$694,898. The county was formed in 1792, and named in honor of Stephen Cabarrus, speaker of the house of commons of North Carolina. Capital, Concord.

CABBAGE, a plant belonging to the botanical order *crucifera*, and genus *brassica*, the order comprehending also the scurvy-grass, pepper-grass, mustard, cress, radish, and turnip, and the genus including also the cauliflower, broccoli, borecole or sprouts, rape, colza, savoy, and kohl-rabi. The *brassica oleracea*, from which all the forms of cabbage spring, is found growing wild on rocky shores and cliffs in England, with no appearance of a head. The cultivated cabbage is considered by some a monstrosity; but its varieties are well marked, distinct, and easily perpetuated, where care is taken to secure such conditions as will continue their exact habits. The cabbage is a biennial; the seed being sown produces a full-grown plant the first season, and the next season sends out shoots $1\frac{1}{2}$ to 2 feet long, which bear small globular seeds in a great number of pods. The whole plant then perishes. The large, solid heads of cabbage, now so familiar to all, were produced from the wild plant by gradual improvement in soils, manures, and cultivation. To repeat them annually it is necessary to observe 2 points: 1. None but those heads presenting the best type of the variety should be saved for seed; they must be taken up with the roots before frost sets in, the useless outside leaves removed, and set in a cool, dark cellar, with the roots imbedded in soil, and packed as closely as possible. In spring they are set out about $2 \times 2\frac{1}{2}$ feet apart in good garden soil, and no seed saved except from the most vigorous stalks. 2. They must not produce seeds near other plants seeding at the same time, which belong to the same tribe, such as cauliflower, turnip, broccoli, &c., as they will mix through their flowers, the seed producing mongrel varieties. Much disappointment is experienced from using seeds carelessly produced by seed-growers to sell. There are many very valuable varieties of cabbage, some suited to particular localities. For early use, early York is an old favorite, some preferring the early flat Battersea. Coming next in succession, a new cabbage, Winningstadt, is excellent, heads compact, growth rapid. About New York, the late Bergen, flat Dutch, and best varieties of drumhead cabbages are preferred for late sorts. Three crops are secured in a season; seeds of early and late sorts are sown in a moderate hot bed in March, for the latitude of New York city, kept slightly moistened, with plenty of air at all times when the temperature is not too

low. The plants are dusted with dry wood ashes, pulverized lime, or a little Scotch snuff, to keep off the fly—which is a small black insect, a great pest—thinned to an inch apart, and kept free from weeds. When the beds outside are dry and warm enough, the plants are removed during a cloudy day, or in the afternoon, and the early sorts set with a dibble, 14 to 18 inches, the later ones 20 to 22 inches apart each way, watered, and allowed to take root before disturbing the soil about them. If the weather continues dry, the plants should be watered 2 or 3 evenings in succession. This planting gives the earliest cabbages, and summer cabbages, which come between the early and late crops. For a late crop the seeds are sown in an open bed, thinly, in drills 6 to 9 inches apart, in May, and transplanted from June 10 to July 1, in straight rows, 22 to 27 inches asunder each way. The cabbage is a rank feeder, and an exhaustive crop. The soil should be a deep, rich loam, not only containing plenty of vegetable matter, but a full supply of potash, soda, and lime. A dressing of common salt, at the rate of 10 bushels per acre, will not only benefit the cabbage crop, but kill grubs and worms, which destroy the young plants rapidly. Coarse manures should not be applied the same season the cabbage crop is to be grown. Hogpen manure must not come near the cabbage crop, as it disfigures the roots, and destroys the plant. Composts of muck, wood ashes, lime, salt, and common yard manures, well decomposed, may be used in large quantities if well incorporated with the soil. Guano, dug deeply under, is good in all but very light sandy and gravelly soils. A first-rate superphosphate of lime, with $\frac{1}{4}$ its weight of guano mixed with it, is one of the best manures for an old garden soil, or one which has always received common manures. This compound may be dissolved in water, and be freely used to water feeble plants, or dug in about them with a hoe. As soon as young plants have taken root in the new bed, they should be hoed, the oftener the better, till the leaves shade the soil. In its younger stages, the cabbage must feed largely on carbonic acid, &c., by its roots; but as it increases in size, it uses the leaves more extensively—hence the necessity of early and frequent hoeings. Some growers on Long Island, and in New Jersey, who supply New York market, produce from 20,000 to 100,000 each annually, which bring from 2 to 18 cents per head, according to size and season; a fair price in summer and autumn is about 6 cents. The fields are prepared by deep and subsoil ploughing, and are heavily manured, the horse hoe and subsoil lifter being used by the most skillful, while at greater expense of manual labor the old style of culture is still kept up.

CABBAGE PALM (*areca oleracea*), the highest of the American palms, often attaining an elevation of 150 feet, with a trunk of not more than 6 inches in diameter. It is found abundantly in the West Indies, and is very distinct

from the East Indian species of *areca*. The leaves grow only from the top, and their sheaths are so close that they form the green top of the trunk 1½ feet in length. The inhabitants cut off this top, take out the white heart of 2 or 3 inches in diameter, consisting of delicate leaves closely folded together which have been protected from any access of light, and eat it either raw, fried, or baked. A tree which has grown for half a century is often cut down for the single bud or cabbage which crowns it.

CABELL, a western county of Virginia, separated from Ohio by the Ohio river. It is watered by the Guyandotte, and traversed by the principal thoroughfare from the Ohio to Richmond, and by the projected route of the Covington and Ohio railroad. The surface is hilly, and the soil in many places quite good, producing Indian corn and oats. In 1850 it yielded 281,526 bushels of Indian corn, 44,913 of oats, 11,659 of wheat, and 8,947 lbs. of tobacco. There were 9 corn and flour mills, 10 saw mills, 4 wool-carding mills, 4 tanneries, 14 churches, and 374 pupils attending public schools. Organized in 1809, and named in honor of William H. Cabell, governor of Virginia in 1808. Area, 418 sq. m.; pop. in 1850, 6,299, of whom 329 were slaves; capital, Harboursville; value of real estate in 1855, \$1,882,959.

CABES, *Guzzor*, an islet of the Mediterranean, on the N. E. coast of Africa. The towns of Cabes, or Khabe, and Sfax, or Sfaxus, are situated on its shores. Its ancient name was *Syrta Minor*.

CABET, *Erizwan*, a French communist, born at Dijon, Jan. 2, 1788, died in St. Louis, Mo., Nov. 9, 1856. He was brought up for the bar, and was appointed attorney-general of Corsica, from which office, however, he was soon dismissed. He was sent to the chamber of deputies in July, 1841. There he made himself so obnoxious to the government by his violent speeches, and at the same time by his inflammatory pamphlets and a journal entitled the *Peupliers*, that he was indicted for treason, and rather than subject himself to the imprisonment to which he was sentenced, he withdrew for 5 years to England. While there he published the *Voyages en Italie*, in which he elaborated his scheme of communism, which from 1842 to 1848 passed through 5 editions. On Feb. 2, 1849, a band of 69 Icarians left France for the Red river in Texas, where Cabot had secured a tract of 400,000 acres of land, the free use of which was open to the settlers, under condition that before their departure they should deposit all their funds in the hands of Cabot, who assumed the financial and general control of the expedition. But the expedition turned out badly, and lawsuits were instituted against Cabot; and on Sept. 30, 1849, after he had left France for Texas, he was found guilty by default of swindling his disciples, and sentenced to 2 years' imprisonment. Meanwhile, with his colony of Icarians dwindled down to about 30 persons, he took up his abode at Nauvoo, on the Mississippi, in May, 1850, and soon

after returned to Paris. There, after a protracted trial, his innocence was fully established, July 26, 1851, by the court of appeal, and the judgment against him cancelled. He returned to Nauvoo, where he continued to preside over his colony; but many disappointments and cares embittered his life and accelerated his death. In justice to Cabot it should be said, that the highest moral tone prevailed at Nauvoo, and whatsoever may be the political-economic objections to his system, the colony presented, as far as the conduct of the settlers was concerned, a model of purity and industry.

CABIRI (Gr. Καβίροι), mystic Pelagic divinities, which, according to Herodotus, were introduced thence into Samothrace, though they are spoken of as earliest worshipped in Lemnos. Neither modern critics of mythology nor the ancients themselves are agreed either upon the names, number, or origin of the Cabiri. By some there are said to be 6, by others 4, and others reduce them to 2. Some attempt to identify them with Castor and Pollux, others with the Corybantes, others still with the Roman penates. But whoever they were, they were regarded as the authors of religion and of the human race, and were worshipped by mysteries secretly guarded from the knowledge of the uninitiated. Their worship gradually spread over Greece and Italy, but seems to have fallen into early disuse in all but a very few places. From what has transpired concerning the mysteries, it seems certain that the candidates for initiation were required to pass a long and painful abstinence from food and pleasure, and when admitted within the dark temple, were crowned with olive, girded with a purple belt, and then treated to all sorts of hideous sounds and sights, with most sudden alternations from din to silence, and from light to darkness, and were made to drink of 2 fountains, one of which (Lethe) was expected to obliterate the memory of the past, and the other (Mnemosyne) to secure a vivid recollection of all that was to be now taught them. The whole ceremony indicated an entire disconnection of their past and future lives. They were absolved from all their sins, and began a new existence. During the annual ceremonies in Lemnos, which like those in Samothrace lasted 9 days, all the fires on the island were extinguished, and new fire brought in a consecrated vessel from Delos. Those who were initiated were thought to be insured against storms at sea, and the purple girdle was worn as an amulet. The mysteries of the ancient religious systems probably have a common origin in these Cabirian rites, and some writers have attempted to trace the oriental and druidical ceremonies to this common source.

CABLE, a strong rope or chain. The name has of late years been applied to slender ropes used for telegraphic purposes, very likely on account of their great length. Cables are occasionally used to close the entrance of har-

bors, but most generally they serve to connect ships with their anchors. The greatest improvement ever made in the mooring of vessels is the substitution of the chain cable for the hempen one, which has been effected during the last 50 years. A chain is much less bulky and much more pliable than a hempen cable of the same strength; it is consequently stored in much less space, and is handled more easily. On account of its great bulk, a hempen cable loses much of its weight in the water, and consequently assumes a position much less curved than a chain. The great curvature of a chain makes it yield and play as if it were elastic when the vessel gives sudden jerks, and thus the strain upon a chain from this cause is never so great as upon a hempen cable. On a rocky bottom a chain will simply be polished bright by attrition, where a hempen cable would be cut in a few minutes. When the bottom is strewn with heavy stones, or with projecting points of rocks, round which the cable winds itself during the various evolutions of the ship caused by winds and tides, a hempen cable is often cut, or at least greatly injured, while a chain cable does not suffer in the least, on account of its power of resisting side strain, as will be explained hereafter. On board vessels, the cables are named after the anchor they are used with. The largest is called the sheet-anchor cable, and is used at sea; the next in size is the stream-anchor cable, and is used in rivers. Cables are made of various lengths, according to their size and to the service they are intended for. A cable's length is a measure of distances used by sailors, and is equal to 120 fathoms.—HEMPEN CABLES are large ropes of the kind denominated cable-laid. The fibres of hemp are first twisted into yarn; a number of yarns are twisted together into a strand; 3 or 4 strands are twisted into a rope denominated plain-laid; 3 or 4 ropes, used as strands, are twisted together to make the cable. The strands of a cable are consequently formed themselves of strands. The twist is reversed at each successive operation; that is, the yarn is formed by twisting the fibres from right to left; the yarns are twisted together from left to right, &c. It is customary to designate the size of a hempen cable by the length of its circumference, and that of a chain cable by the diameter of the rod of which the links are made. The largest usual size of cable is 24 inches circumference; it weighs 1 cwt. per fathom, is made of 3,000 threads, is equal in strength to a chain 2½ inches diameter, and is tested to carry safely 80 tons. Hemp in its natural state is stronger than when wet or tarred; nevertheless, it is advantageous to tar the cordage which is to be used at sea, as tar protects it against water, which would weaken, and ultimately rot it. It is obvious that the process of tarring after the cable is made is imperfect, and simply better than nothing, as the tar does not reach the core; the true way is to tar the yarns of which

the ropes are made.—CHAIN CABLES. The plan of substituting chains for cordage for holding anchors was patented in England in 1808 by Mr. Slater, a naval surgeon. Want of capital prevented him from demonstrating by experiments the value of his invention. In the year 1811, Capt. Brown, of the *Penelope*, 400 tons burden, made a voyage of 4 months to the West Indies, using a chain cable with twisted links. The success was complete. During the following years several vessels were saved by their iron cables, and thenceforward the change from hemp to iron proceeded uninterruptedly, till, at the present time, it would be difficult to find a ship without a chain cable on board. The form of links adopted by Capt. Brown was most imperfect; several other shapes were successively tried, till the best form was found and patented in England by Bronton. The general shape of Bronton's link is that of an ellipse. The inside curve, at each extremity of its long axis, is of the same curvature as the rods used to make the chain. In this manner there is just room enough for the next link, and no more. Across the link in the direction of the small axis is a cast-iron stay enlarged at its extremity, with a small projecting point in the centre of each end, which enters the link and keeps the stay in its place. From the extremities of the stay to the curve at each end, the rod forming the link is perfectly straight. When a cable chain with links of this construction is pulled upon, it resists twice as much as the rod of which it is made, and does not stretch more than a straight rod. If an obstacle is opposed to the side of the chain, the link or links acted upon may assume 2 different positions: the link may rest against the obstacle by its side, the axis of the stay being perpendicular to the face of the obstacle; in this position the link is strongest, as all its parts brace each other to prevent the bending of any—or the link may rest flat against the obstacle; in this position it is very weak, but this cannot happen if the obstacle is large, as in such case the next links would rest first against it by their sides, and if the obstacle is small, it is pressed between the sides or the back bones of the 2 next links, which close upon it and crush it to pieces. The links wear out much faster by their friction against each other, than by any other cause; and experience has taught that the ends where the friction is greatest should be of rod iron of a larger diameter than that of the sides. In consequence, the rods are manufactured with swellings at the places which are to form the ends. Several simple machines are used to manufacture chain cables; the successive operations are as follows: 1, heating them of the required length, but with opposite bevels; 2, bending the rods around an elliptic mandrel; one end is placed against the side of a vertical mandrel, and held there by a vice attached to the last, and a lever provided with a projecting pin extending out-

side the rod is made to describe an ellipse, carrying the hot rod around the mandrel; this lever does not turn around a pin in the centre of the mandrel, but is attached to 3 slides, which are forced to move in grooves occupying the position of the two axes of the mandrel; thus the pin of the lever describes an ellipse parallel to the periphery of the mandrel; 4, the next link is hooked to the last preceding link of the chain in process of making, and welded at a small forge; 5, while it is still hot, the case iron stay is introduced, and the link placed in a press, which compresses the two sides close upon the stay, at the same time that it makes these sides straighter; during this last operation an auxiliary straight rod is placed inside the end of the link, where the next link is to come, to prevent its closing. There are circumstances in which it is necessary to sever a cable, or to shorten or lengthen it; this is done by means of a bolt and sheave substituted for a link every 5 yards. Improvements have been made in the machinery for making chains, in which operations formerly executed by hand were performed mechanically, but we do not know that they have been applied to the manufacture of chain cables, and it is doubtful whether they would succeed as well on a large as on a small scale. The manufacture of chain cable was begun in the United States in the year 1825, by Messrs. Cotton and Hill, of Boston. They worked successfully during 50 years, when, finding they could no longer compete in cheapness with the importers of English-made cables, they closed their works. Several instances have since happened of vessels being lost by the breaking of the chain in fair weather, showing conclusively that the English makers, in the heat of competition, had been using very inferior iron, and that the certificates of proof test accompanying the cables were either spurious, or had been delivered for other cables than those sold. These facts called for action on the part of ship-owners and insurance companies, and Messrs. Cotton and Hill were induced to reopen their works in 1877. A large amount of property, not to speak of human life, has been lost at sea and on the American lakes by the use of cheap chains. It is now well understood that economy in this respect is a dangerous mistake.

—The TELEGRAPH CABLE consists of one or more submarine wires enclosed in gutta serena, and protected by an external covering of wires. It is used for crossing rivers, having superseded the use of high poles on the banks, and for submarine purposes. The currents and freshets of rivers, especially of those in the west of the United States, and the breaking of the ice, are much more injurious to a cable than the tempests of the sea, and the strongest wires are required to withstand their action. It is not known whether a cable was first laid across a river in England or in America, but the first one laid across a sea river that from Dover to Calais. This cable was made by Newall and

Cox, of Liverpool. It consists of 4 copper wires $\frac{1}{8}$ of an inch diameter each, coated with 2 layers of gutta serena so as to be increased in size to $\frac{1}{4}$ inch diameter. The 4 covered wires are laid parallel, with a slight twist to prevent them from separating, and the spaces between them are filled with tarred hempen yarn. The whole is tied by winding spirally around it another piece of tarred yarn. The external covering consists of 10 iron wires of more than $\frac{1}{2}$ inch diameter, forming around or nearly hollow 10 inches pitch. The outside circumference is 4 inches; the weight is 7 tons per mile; the distance from shore to shore 21 miles; the cost is \$45,000 for 25 miles; it was successfully laid October 17, 1851. Since then, smaller and larger cables have been constructed, with very slight modifications, and successfully laid. The Atlantic cable, the laying of which was completed Aug. 6, 1858, has a core of 7 fine copper wires forming a rope, around this rope are 3 layers of gutta serena, which is protected by tarred hemp wound around, and the whole is covered by 18 strands of 7 fine iron wires each. The circumference is nearly that of a disc, the weight 1,800 lbs. per mile. Of the total length manufactured, 2,000 miles, $\frac{1}{2}$ was made by Newall and Cox, Liverpool; the other half by Elliot, Glass, and Co., Greenwich, London; both firms being the most renowned in Europe. The Messrs. Chester, of New York, have lately established an improved set of machines for manufacturing telegraph cables and wire ropes. This machine can make a cable from $\frac{1}{2}$ inch to 3 inches in circumference, the external covering of the last being formed of 12 wires of the largest size, that is, about $\frac{1}{2}$ inch in diameter. The machinery for making telegraph cable is quite different from that for working hemp. The reason is in the fact that wires must not be twisted, but simply laid, and that it is just the contrary for hemp.—The length of some of the best known submarine cables is: Dover to Calais, 24 miles, laid in 1801; Dover to Ocrand, 78 miles (1852); Holyhead to Howth, 55 miles (1852); England to Holland, 115 miles (1853); Italy to Corsica, 65 miles (1854); Yarus to Balaklava, 340 miles, Balaklava to Eupatoria, 60 miles (1855); across the gulf of St. Lawrence, 74 miles (1856); Sardinia to Arles, 125 miles (1857); Atlantic cable, Valantia bay to Trinity bay, 1,850 miles (1858).

CABO FRIO (Cool Cape), a cape, city, and seaport of Brazil, province of Rio Janeiro. The city is situated at the S. E. extremity of Lago Araruama, and N. E. of the cape. A stone bridge, built in 1836, connects it with the continent. It has an electrical college, established in 1840, and an extensive trade in salt and fisheries; but the climate is unhealthy. Pop. about 8,500.

CABOOL, or KANOOI, a province of Afghanistan, extending from the Hindoo Kooch on the N. to the S. of Ghaznee, and from the Khyber mountains on the E. to Bamian on the W. It is about 250 miles in length, and 150 in breadth,

Cabool was once the name of a powerful kingdom, which reached almost from the shores of the Caspian sea to the vicinity of Delhi, and from the Oxus to the Persian gulf.—CABOOL, the capital of the above-described province, and of the Dooranee empire as long as it existed, is in lat. 34° 30', long. 69° 6', on the Cabool river, immediately above its confluence with the Loghur. The city is about 8 miles in circumference, and is but indifferently fortified, being merely defended on the western side by a line of weak ramparts extending from one to the other of those ranges of hills which almost surround the plain wherein Cabool stands. The houses are built of sun-dried bricks and wood, and are in general from 2 to 8 stories high. Four spacious bazaars, erected by the celebrated Ali Murdan Khan, once adorned the centre of the city, but in 1842 the British utterly destroyed them. The citadel, styled Bala Kissar, or Upper Fort, occupies an eminence in the eastern quarter, and contains the governor's palace. The mosques and other public edifices exhibit no architectural beauties. Cabool has but one college, and even that is fast going to ruin. The serais, or public inns for strangers, are numerous, but neither elegant nor convenient. The baths are abominable, both because of their filthiness, and because of the offensive smell proceeding from the fuel which is used in heating them. The city is abundantly supplied with water for every domestic and industrial purpose by the river Cabool, which is here crossed by 8 bridges; one, a substantial structure of brick and stone; another, a frail fabric of wood, over which even the foot-passenger cannot pass in safety; a third, which spans the river toward the west, is strongly fortified and jealously guarded by armed sentinels. The climate of Cabool, from its proximity to the great Himalayan range and from its elevation above the level of the sea, is severe in the winter season, which begins early in October, and lasts till the end of March. During this period the opulent citizens seldom leave their houses, passing the tedious time within doors in as agreeable a manner as possible. In the summer season, however, when the climate of their city is as healthful as it is delightful, they indemnify themselves to some extent for their hibernal imprisonment, by living almost entirely in the open air.—Cabool is a city of considerable antiquity. As early as the 7th century of our era it was the residence of a Hindoo prince, and in after times it was for a short period the metropolis of the emperor Baber. In 1789 it was taken by Nadir Shah, and annexed to his dominions. On the death of Nadir Shah, Ahmed Shah Abdallah seized on it, and in 1774 his son and successor, Timour, made it the capital of the Dooranee empire. After the downfall of Mahmood, the last of the Dooranee dynasty, Dost Mohammed Khan took possession of Cabool and its territory, and maintained himself there till 1839, when the British marched an army into the country, under pretence of

placing Shah Shooja, the brother of Mahmood, on the throne of his ancestors, and occupied the city. On Nov. 2, 1841, however, their occupation was suddenly terminated by an outbreak on the part of the inhabitants, which resulted in the massacre of the whole British force with the exception of 1 European and 4 or 5 sepoy, who had the good fortune to escape, and a few persons of rank that were spared for the sake of the ransom which might be obtained for them. Gen. Pollock subsequently advanced toward Cabool and was joined by the forces under Gen. Nott; the English army re-occupied the town in Sept. 1842, liberated the prisoners, and avenged the outrage by destroying the principal public edifices of the offending city. This achieved, the British retired, and left Dost Mohammed to resume his sway over it. Subsequently overtures were made by the ruler of Cabool, and an alliance was concluded, March 30, 1855. Pop. about 70,000.

CABOT, GEORGE, U. S. senator from Massachusetts, was born in Salem, Essex co., in Dec. 1751, died in Boston, April 18, 1823. At an early age he went to sea and rapidly rose to command, and made some voyages as master of a ship, diligently employing all his leisure in well-selected reading. His extraordinary qualities were soon recognized. When 25 years old he was a member of a provincial congress which met at Concord, in Massachusetts, and there he displayed much wisdom in preventing certain measures by which it was hoped to control the price of merchandise. At that time the science of political economy was almost wholly unknown, but he had already grasped its leading principles. As a member of the state convention which, in 1788, adopted the federal constitution, he maintained a high position; and, being immediately afterward sent from Massachusetts to the senate of the United States, he won not only general respect, but the especial confidence of Washington and Hamilton. His knowledge of commerce and of the laws and methods of trade, greatly assisted Hamilton in maturing his admirable system of public finance. In 1798 he was offered an appointment as secretary of the navy; he refused it and renounced all public life, but was afterward sometimes urged to take office with an importunity he could not resist. From an early age he was accustomed to guide others by his calm and accurate judgment, his power of bringing within consideration all the facts and reasons which were of the essence of a question and them only, and his capacity of escaping from other men's excitement, even when his interest in any matter was not less than theirs. The same qualities were applied to public questions with the same happy results. And thus, although he had no desire for public life, and all experience of it only strengthened his love of retirement, he was obliged to yield in some instances to the conviction that important exigencies called upon him to do what no other man could do so well. He never shrank either from labor

or responsibility. He knew that no breath of slander ever assailed him, and that all men regarded him as equally incorruptible by passion or by interest. He knew, also, the power which this position gave him, and the duty it imposed, of guiding public opinion through those channels in which no man was equal who did not enter into the actual interests of the day with an earnestness that secured the sympathy of those most interested, with character enough to influence others, and with strength to save, not himself only, but the multitudes whom he led, from the aberrations of passion or prejudice. It seemed to be his function to induce others to submit themselves to the same good sense which was the unflinching and unerring master of his own life. In the Hartford convention, of which Cabot was president, his characteristic qualities were most active and conspicuous. This is not the place to speak of that body, but of Cabot in connection with it we may safely say that he was the leader of those members who went there determined not to stop short of such measures as they deemed legal, justifiable, and necessary, but not to go, and not to suffer an excited people or their excited representatives to go any further. In his conduct in that convention he only displayed the same characteristics and the same important usefulness which had marked his whole public career and his private life.—He belonged always, by education and by the constitution of his mind, to the federal party of that day, that is, to the conservative, rather than to the progressive party, or to the party characterized by the wish that law should define and guard public freedom rather than by the passionate desire for liberty, with more regard to its extent than to its quality.—He was not an orator, but was most persuasive, both in public and in private, by the clearness of his views and the sagacity of his arguments, and by his absolute freedom from all that insincerity or duplicity which brings against a speaker a suspicion or a fear fatal to his influence.—His personal appearance, dress, and habits were of great elegance and refinement, but of equal simplicity. His conversation was extremely attractive, conveying as it did a wisdom by which all felt that they were instructed, but always with such ease and playfulness that none were oppressed. In his later years, while living for the most part as a private man, he probably exerted as great an influence upon public opinion as any one of his contemporaries. He was a member of the church in Boston of which Dr. (afterward president) Kirkland was pastor, and died at the age of 79, after hearing with exemplary fortitude the distress of a lingering and painful disease. He left a son, who still survives, and a daughter who, after his death, married Dr. Kirkland and has since died.

CABOT, JUNR, or GIOVANNI CABOTA, or, in the Venetian dialect, ZUAN CALBO, or ZUAN CABOTA, the discoverer of the continent of North America. His name first occurs in the

archives of Venice; on March 25, 1476, denization was granted him after the customary residence of 15 years. The full entry of his denization would probably have named his birthplace; but it is not to be found. In the year 1495, and probably for years before, he resided at Bristol with his wife, who was a Venetian woman, and 3 sons. At that time it had become the received opinion that the earth is a sphere, and that the shortest and readiest way of reaching the Indies was by sailing west. This opinion was confirmed by the voyage of Columbus, who was thought to have reached the outlying isles of the Indies. On March 5, 1498, John Cabot and his 3 sons obtained a patent from Henry VII., authorizing them, as either of them, their heirs or their assigns, to search for islands, provinces, or regions in the eastern, western, or northern seas; and, as vassals of the English king, to occupy the territories that might be found, with an exclusive right to their commerce, on paying the king a fifth part of all profits. Under this charter, John Cabot, some time in May, 1497, embarked in a single vessel, accompanied by his son Sebastian, and sailed west, as he said, 700 leagues; when, on June 24, 1497, he came upon land which he reported to have been a part of a continent, and which he assumed to be in the dominions of the Grand Khan. A letter of that year represents him as having sailed along the coast for 800 leagues; he landed, but saw no person, though he believed the country not uninhabited. He planted on the soil the banners of England and of Venice. On his return he discerned 3 islands to the starboard, but, for want of provisions, did not stop to examine them. He reached Bristol in August. His discovery was the admiration of that city, and attracted the favor of the English king. On Feb. 3, 1498, Henry VII. granted John Cabot special authority to impress 3 English ships at no higher charges than were paid for ships taken for the king's service, to enlist companies of volunteers, "and theym convey and lode to the loads and lles of late founde by the said John." This license has been erroneously called a second charter; it was not so; the charter of 1496 was still valid and sufficient. This license is the last record that has been found of the career of John Cabot. He himself made no voyage under it, whether from illness or death, or other reason, can only be conjectured. Neither the time nor the place of his death, nor his age, is known. Neither is it known what country gave him birth. He was a Venetian only by denization. As he is found residing at Bristol, the conjecture would arise that he was born an Englishman; but the license granted him in Feb. 1498, calls him "Kabotto, Venetian," a phrase which in our day, and still more in those days of strict or feudal rule, clearly implies that he was not a natural born subject of the king of England. Had he been so, he would have been claimed as an Englishman. Thus not even the natives

country of the discoverer of the North American continent can be ascertained. The authorities respecting John Cabot are, the Venetian archives; the patent granted him in 1496; the license in 1498; a letter dated Aug. 28, 1497, from Lorenzo Pasqualigo, a merchant at London, to his brothers at Venice; and the legend on the map of Sebastian Cabot, cited in Hakluyt, giving June 24, 1497, as the date of the discovery of the continent. In 1566, there was at Oxford a copy of Sebastian Cabot's map on which the date of the legend was 1494. Another copy with the same date has lately been discovered in Germany; but the legend is not by Sebastian Cabot himself, and the original charter of 1496, the letter of Pasqualigo in 1497, and the license of 1498, combine to prove the date 1494 to be an error. The better knowledge of the career of John Cabot is particularly due to the researches of an accomplished English scholar, Rawdon Brown.

CABOT, SEBASTIAN, son of the preceding, a cosmographer, and the discoverer of the coast line of the United States as far south as the Chesapeake. The time and the place of his birth are uncertain. Eden says, "Sebastian Cabotte told me that he was borne in Bristowe, and that at four yeare old he was carried with his father to Venice;" but Contarini, the Venetian ambassador at the court of Charles V., relates in his diary that Sebastian Cabot informed him he was born in Venice, but bred in England; and this is confirmed by the denization of John Cabot at Venice, in 1476, after a residence there of 15 years. The time of Sebastian's birth seems to have been not earlier than 1475, nor later than 1477. There is no sufficient reason to doubt that he accompanied his father in the voyage which discovered America. In May, 1498, he, without his father, led forth 2 ships and a large company of English volunteers from Bristol, in search of a short north-western passage to China and Japan. He sailed so far to the north, that in the early part of July, the light of day was almost continuous. Finding the sea full of icebergs, he turned more to the south, and arrived at land which most persons believe to have been Newfoundland. Pursuing his search, he reached the main land of North America, landed in several places, and saw natives clad in the skins of beasts, and making use of copper. He proceeded as far south as the latitude of the straits of Gibraltar, and as far west as the longitude of Cuba. His object had been to find a passage to the rich continent of Asia, and though he discovered an immense territory under a temperate sky, his voyage was considered a failure. Vasco da Gama had reached India by way of the Cape of Good Hope, and filled the world with his fame. The discoveries of the Cabots were so little valued, that the family suffered the patent granting them the exclusive privilege of trade to be lost. On the death of Henry VII., Sebastian Cabot was invited from England by Ferdinand of

Spain, father-in-law of Henry VIII., and was appointed one of the council for the New Indies. In 1518 he was named pilot major of Spain; in April, 1524, he attended the congress assembled at Badajoz to decide on the conflicting claims of Spain and Portugal to the Moluccas. All the while, and during his whole life, the great object of his ambition was the discovery of a direct passage to Asia. Having in early life failed to find one by the north-west, in 1526 he commanded an expedition sent out in search of a south-western passage. In this pursuit, in 1527 he entered the river La Plata. Remaining in those regions for several years, he discovered Paraguay. He did not pass round the continent at the south, but, returning to Spain, reached Seville near the end of July, 1530. In the first year of the reign of Edward VI., on Oct. 9, 1547, the privy council issued a warrant "for the transporting of one Shabot, a pilot, to come out of Hispania to serve and inhabit in England;" and he came at the summons in 1548, with his mind still bent on finding a short passage to the Indies. On Jan. 6, 1549, the king gave him a pension of 250 marks, or £166 13s. 4d., "in consideration of good and acceptable service done and to be done" by him. On Jan. 19, 1550, the emperor Charles V. applied for his return, but without result. His influence was observable in inspiring confidence and enterprise among the merchants of England; and in March, 1551, "Sebastian Cabote, the great seaman," received from the king a special reward of £200. The patent granted to the family by Henry VII. in 1496 having been lost, he obtained of Edward VI. a copy of it from the rolls, and prepared to prosecute a new voyage of discovery, still in search of a passage to the Indies. In 1553, a company of merchants, of which he was the president, sought to find it by way of the north-east, expecting to turn the north cape of Norway, and sail southerly to China. One of the 2 ships was frozen up in a Lapland harbor, and all the persons on board perished with cold; the other discovered Archangel, and opened a commerce between England and Russia. On Sept. 9, 1553, soon after the accession of Queen Mary, the emperor Charles V., through his ambassador, again and very earnestly made request that Sebastian Cabot should be sent back to his service; of so much importance did he seem even then in his great old age. But Cabot refused to leave England.—A new company was formed for discovery on Feb. 23, 1556, of which he was a partner and the president. On Monday, April 27, 1556, accompanied by divers gentlemen and gentlewomen, he went on board the pinnace the Serch Thrift, which was on the eve of sailing, and distributed most liberal alms; then going on shore, he and his friends gave a banquet to the ship's company, and for very joy at the forwardness of the intended discovery, the octogenarian cosmographer entered into the dance himself. At parting, he com-

mended the ship's company to the governance of Almighty God. On May 27, 1557, he resigned his pension, and on the 29th of the same month he received a new grant of it under a different form. These are the last authentic notices of Sebastian Cabot, one of the most remarkable men of his age. Where he died is not certain, though it was probably in London; the precise time of his death is also unknown, and no one can tell his burial-place.—The best work on Sebastian Cabot is the memoir by Richard Biddle, but further materials have been contributed by Rawdon Brown, and by Varnhagen in his *Historia do Brazil*. One of his maps has lately been found in Germany, and has been published by Jomard at Paris in the *Monuments de la géographie*. In preparing the present article, some unpublished manuscripts have also been used.

CABOTVILLE. See CIMCOPEE.

CABRA (anc. *Ægabrum*), a Spanish town in the province of Cordova. Excellent wine, grain, and fruit, are produced in its vicinity. There are manufactories of cloth and linen, and a great annual fair is held in September. The town contains a fine Gothic cathedral, a Dominican convent, a college, a hospital, schools, a theatre, and famous mineral springs. The grotto of Jarcas and other curiosities attract the attention of the geologist. Pop. 11,576.—The name is common to several small Spanish towns, a village of Central Africa, one of the Nicobar islands, and a small river in Brazil.

CABRAL, ANTONIO BERNARDO DA COSTA. See COSTA-CABRAL.

CABRAL, FRANCISCO, a Portuguese missionary, born in 1528, at Covilhão, died April 16, 1609, at Goa. At the age of 26 years he was appointed professor of philosophy and theology at Goa, and superintendent of the Jesuit schools in India. He proceeded thence to Japan, where he effected the conversion of a large number of the inhabitants, including 2 of the princes with their families. He also had direction of the missions in China, and shared in the toils and self-devotion of the missionaries. He returned to Goa, and held for 38 years the office of superior of the Roman Catholic educational establishment in that place.

CABRAL, PEDRO ALVAREZ DE, the principal discoverer of Brazil, born in Portugal in the latter part of the 15th century, died about 1526. King Emanuel, animated by the discovery of America and of the Cape of Good Hope, determined to fit out a new and magnificent commercial expedition to Calicut, composed of 13 vessels richly laden, and manned by the most experienced and bravest sailors of the time. Cabral was appointed commander-in-chief, and under him served many mariners whose names had already acquired celebrity. After passing beyond the Canaries, the fleet took a westerly direction, and whatever may have been the motive of the course, the result was the more complete discovery of Brazil (the country having been first discovered in the preceding January,

by Pinçon, a companion of Columbus), of which on April 24, 1500, Cabral took possession in the name of his king. He now steered for India, the special object of his mission, but soon lost in a tempest half of his fleet. With the remainder he kept his way and landed first at Mozambique, and afterward at Calicut, and succeeded there, after a series of negotiations with the Indian princes, in establishing a factory. He returned to Lisbon July 31, 1501, having the 6 ships which remained of his fleet laden with the riches of the East; but after this there is no further mention of him in the Spanish annals.

CABRERA (anc. *Capraria*), one of the Balearic islands in the Mediterranean, in the province and S. of Majorca. It is used by the Spanish government, to which the island belongs, as a place of exile, has a fort, and a small harbor. Cabrera is also the name of several villages and a river of Spain.

CABRERA, RAMON, count de Morella, duke de la Victoria, a prominent Carlist general, born at Tortosa, in Catalonia, Aug. 31, 1810, in the middle walks of life, brought up for the clerical profession, for which, however, he was unfitted by his love of pleasure and dissipation. When, after the death of Ferdinand VII., civil war broke out between the partisans of his brother Don Carlos and those of the present queen Isabel II., the priests became the most zealous champions of Don Carlos, and their enthusiasm acted so powerfully upon the impetuous spirit of young Cabrera, that he joined in 1833 a small band of guerillas. He fought with singular ferocity, which rose to fury, when, Feb. 16, 1836, upon the order of the queen and of Mina, Gen. Noguera put to death Cabrera's aged mother and his 8 helpless sisters. Cabrera took vengeance upon all the Christinists who fell into his hands. His enemies treated him like a wild animal, and hunted him, after he had laid waste Aragon, Valencia, and Andalusia, from one place to another, until exhausted, wounded, miserable in body and spirit, he only escaped from their hands by taking refuge in the house of a priest in the village of Almagon. As soon as he had recovered his health, he resumed his attacks upon the Christinists, and after a temporary defeat at Torre Blanca, eventually took Morella. Hence in 1838 Don Carlos created him count de Morella, and at the same time lieutenant-general, and in this capacity Cabrera continued to fight for the cause of the pretender, and for what he considered the cause of the priesthood and the church, until 1840, when he was compelled to flee to Paris. By order of Louis Philippe he was arrested and consigned to the fortress of Ham, but was soon set free. In 1841, he took up his residence at Lyons, and remained there passive until 1845, when he opposed the abdication of Don Carlos in favor of the count of Montemolin, with whom, however, he was, notwithstanding this political opposition, on intimate social terms, and whom, in Sept. 1846, he

accompanied to London, in the hope that the Spanish marriage question would offer a good opportunity to dispose the court of St. James favorably for the cause of the Carlists. He also resumed his agitation in Catalonia, Valencia, and Aragon, but he was as little successful in Spain as in England. There was not the least chance for any rising on behalf of the count of Montemolin until 1848, when the French revolution filled Cabrera with the most sanguine expectations; which, however, were doomed to disappointment, as on his arrival in Catalonia he was but indifferently received, and on Jan. 27, 1849, he was severely wounded at Pastoral, although he succeeded in making good his escape to France. He was again arrested, and again set free in August of the same year, when he took up his abode in London. Here he married a rich English woman, a Miss Marianne Catharine Richards, who had conceived an enthusiastic attachment for the forlorn cause of the Spanish Carlists and for their representative. In July, 1850, he proceeded to Naples, in order to turn to the benefit of the count of Montemolin the differences existing between the Spanish and Neapolitan cabinets, but at the beginning of 1851 he was expelled from Naples, and since then has alternately resided in England and France.

CACAPON (often pronounced Capon), or **GREAT CACAPON**, a river of Virginia, about 140 miles long. Rising in the Alleghany mountains, it traverses Hardy, Hampshire, and Morgan counties, and falls into the Potomac about 4 miles W. of Bath or Berkley springs. The Little Cacapon flows through Hampshire county, a few miles west of the river just described, and also enters the Potomac.

CACCIA, **GUGLIELMO**, an Italian painter, born at Montabone in 1568, died in 1625, more commonly known by the name of Moncalvo, from the place of his education. He was one of the best fresco-painters of his century. Many of his works remain in galleries in the northern part of Italy, among which may be mentioned his masterpiece in oil, the "Descent from the Cross," and his "Glory of Angels." He founded the convent of the Ursulines at Moncalvo, where 5 of his daughters took the veil, two of whom are remarkable as being among the few women ever known to have been skilled in fresco-painting.

CACERES, the ancient *Cecilia Castra*, a city of Spain, capital of a province, and on a river of the same name, about 175 miles S. W. from Madrid. It was founded by Q. Cæcilius Metellus in 142 B. C., and contains some fine monuments and curious Roman and Moorish antiquities. The new part of the town surrounds the old, and contains 1 handsome principal square, which is a favorite resort of the inhabitants. It has manufactures of cloth and earthenware, and considerable commerce. Pop. 12,051. It was taken from the Moors by Alfonso VIII. in 1142. They recaptured it, and it was finally taken from them by Ferdinand II. of Leon in 1184.

CACHAR, **KATSOHAR**, or **HAINUMBO**, a district of British India, in the presidency of Bengal, bounded N. by Assam, S. by Independent Tiperah, and lying between lat. 24° 18' and 25° 50' N., long. 92° 24' and 93° 28' E. Length from N. to S. 110 miles; breadth, 65 miles; area, 4,000 square miles; population, 60,000. It comprises 2 divisions—Cachar proper, or S. Cachar, and Dharmapoor, or N. Cachar. It is a mountainous, well-wooded, and abundantly watered district, traversed from E. to W. by the Barak, a river navigable during most of the year, and by several small streams, down which timber, bamboo, and canes are floated. Travelling is attended with more than common difficulties, owing to the small number of roads, the frequently impassable state of the jungles and mountain pathways, and the inundations prevailing from June to November. The moisture arising from heavy periodical rains renders the climate cooler than that of Calcutta, but deadly to Europeans. Vegetation is rapid and luxuriant. The tangled grass and thick woods shelter vast numbers of elephants, buffaloes, wild deer, and tigers; and so formidable are the latter, that a large reward has been offered by government for their destruction. The principal crops are rice, sugar, coffee, and cotton. The exports are salt, timber, cotton, wax, silk, and iron ore. The inhabitants resemble the Chinese in appearance, are robust, and fairer than the Bengalese.—Cachar was invaded by the Burmese in 1774, and was shortly afterward compelled to pay tribute to them. During the administration of the rajah Govind Chunder, who mounted the throne in 1810, it excited the cupidity of the neighboring state of Cassay, and for 5 or 6 years was the arena of incessant contentions among the several princes of that nation. One of the latter finally obtained the mastery, expelled the rightful rajah, and was in turn dispossessed by the Burmese, after which the British put an end to the strife by occupying the country, and restoring Govind Chunder to his throne in 1824. A portion of the territory which resisted his authority was made over to its *de facto* ruler, and has since lapsed to the East India company. The rest was divided between the British and the rajah of Cassay, on the death of Govind Chunder without heirs in 1830.

CACHET, **LETRES DE**, one of the most convenient devices of despotism in France before the revolution. They were simply sealed letters from the king, countersigned by a secretary of state, by virtue of which a man was arrested, taken to a prison, and put out of the way, without any judgment or appeal. Formerly, under the name of *lettres closes*, they were made use of occasionally to send imperative orders to a court, as a means of delaying the course of justice; but in the 17th century their use was extended. They were obtained by any one having influence with the king or his ministers, and persons were imprisoned, sometimes

far life, on the most frivolous protertia, for the gratification of private pique or revenge. They were most frequently resorted to during the reign of Louis XV. Had some nobleman ruined a poor girl, he silenced the complaints of an indignant father by sending him to prison through the means of a *lettre de cachet*. Was some honest officer in the administration suspected of looking too deeply into the so-called secrets of state, a *lettre de cachet* was immediately issued to punish his indiscretion. A lady of high rank being in love with some prince, and annoyed by her husband's jealousy, found nothing easier than to have the husband confined to a dungeon. Husbands, in their turn, had recourse to the same expedient to get rid of their wives. Thus, any courtier, if he had friends about the ear of the king, his ministers or favorites, could shield himself against the consequences of his crimes. There was even a time when money was sufficient to obtain *lettres de cachet*, and the mistress of one of the ministers of Louis XV. sold them openly. The father of Mirabeau obtained no less than 50 *lettres* against his son. Lotada was confined to prison for 25 years for a trifling intrigue against Mme. de Pompadour. When the Bastille was taken by the people, July 14, 1789, there were prisoners who had been brought there on *lettres de cachet*, who had not seen the light for 20 years; others who had been so long detained that they had become idiots, and could not remember why or when they had been incarcerated.

CACHUCHA, a Spanish dance, made popular in Europe by the inimitable grace with which Fanny Elssler introduced it into the ballet of *Le diable boiteux*. The steps are those of the bolero and fandango. An air of an old Spanish ballad and castanets accompany the dance.

CACIQUE, or **CACIQUE**, an aboriginal Mexican term of nobility. It has been applied by the Spanish-Americans to the chiefs of the Indian tribes of Central and South America.

CACTUS, a genus of plants, the type of the natural order *cactaceae*, comprising numerous species, all of which are natives of America. The name was originally given by Theophrastus to a spiny plant of Sicily. The cactuses have fleshy and succulent, globular or columnar, often deeply channelled and many-jointed stems, usually leafless, but armed with spines and bristles. The structure of many of the species is singular and grotesque, and their appearance is interesting, by reason of the roughness of the stalks and the beauty of the flowers. Found chiefly in the hot sunny places of tropical America, their stems are filled with an abundant juice, which, being enclosed within a tough and impervious skin, enables them to support a sluggish vital action without inconvenience in a parched soil. They vary in stature from creeping stems to angular ascending trunks, sometimes 90 feet in height. The flowers, varying from pure white to rich scarlet and purple, are much increased in size

and brilliancy by cultivation in gardens and greenhouses. They thrive, however, only in the poorest soil. More than 60 species of cactuses have been described. The *C. melocottus*, the great melon thistle, or Turk's cap, grows from the apertures of rocks in the dryest and hottest parts of America; it appears like a green melon, with deep ribs, set all over with sharp thorns, and was likened by Linnaeus to a hedgehog; it has on the top a small discoid villous cap, from which the flowers grow in a circle; it attains a height of 4 or 5 feet in the West Indies, and has been brought to more than half this size in England; in times of drought they are ripped up by the ants and their most internal part greedily devoured. The *C. grandiflorus* is remarkable for its large, beautiful, sweet-scented flowers, which begin to open in the evening, and close again forever before morning; the calyx, nearly 1 foot in diameter, is of a splendid yellow, enclosing pure white petals, and the flower during the 5 or 6 hours of its continuance is hardly surpassed in beauty; its structure is such that in cultivation it may be trained against a wall. The *C. flagelliformis* is a more delicate species than the preceding, with a greater number of smaller pink flowers, which keep open 3 or 4 days; its slender trailing branches require support. The *C. Opuntia*, prickly pear, or Indian fig, derives its name from Opus, in Greece, where it was indigenous; although, like the others, a native of America; it also grows wild in Italy, and flourishes in the lava at the foot of Etna; it is cultivated in England and America for its fruit, upon which the Indians of Florida lived almost exclusively for 3 months in the year. The *C. tina* is used for hedging; 3 rows of it were planted as a boundary when the island of St. Christopher was divided between the English and the French. The *C. coccinifer* is the chief nourishment of the cochinal insect; the delicate red juice of the fruit imparts a tinge to the urine. All the species of cactus are best cultivated in a sandy loam mixed with brick rubbish.

CACUS, a giant, said to have been the son of Vulcan, and represented by the classic poets as a monster who continually vomited forth fire and smoke. He dwelt in a cave on Mount Aventine, and the entrance to his den was adorned with human heads and limbs. He was the terror of the inhabitants of the surrounding country, whose cattle he stole and dragged backward into his den, so that their tracks could not be discerned. Having dealt thus by some cattle belonging to Hercules, he was finally slain by that hero; the *ara mazius* was dedicated in honor of his victory.

CADAHALSO, José de, a soldier and poet of Spain, born in Cadix in 1741, died at Gibraltar, Feb. 27, 1782. At 20 years of age he travelled through Italy, Germany, England, and Portugal. On his return to Spain, he entered the army and rose to the rank of colonel. He published tragedies and Amoreonic poems which gave him a high reputation. His work,

Eruditos a la Violeta, was a satire on superficial learning. He also directed the early genius of Melendez Valdez, so that it was said that of all his works Melendez was the best.

CADAMOSTO, or CA DA MOSTO, LUIGI, an Italian navigator, born in Venice in 1492, died about 1480. Before he was 22 he had made several voyages in the Mediterranean and Atlantic. In 1454, during a voyage to the Netherlands, his vessel was constrained by bad weather to put in at Cape St. Vincent, in Portugal, where Prince Henry, the heir apparent to the crown of that kingdom, then chanced to be sojourning. This prince proposing to the young Venetian that he should undertake a voyage of discovery to the islands and coast of Africa, he sailed March 22, 1455, from Lagos; visited Madeira, the Canaries, Capes Blanco and Verd, the Senegal and the Gambia. In the following year he sailed along the African coast as far as a river to which he gave the name of San Dominico. On his return to Venice he wrote an account of his 2 voyages, first published in 1507.

CADARI, a sect of Mohammedans, who denied fatalism and asserted the freedom of the will. The founder of the sect suffered martyrdom.

CADDO, a parish of Louisiana, bordering on Texas and Arkansas; area, 1,200 sq. m. Red river and the Great Raft form its eastern boundary. During 8 months of the year the river is navigable as far as Shreveport, the capital. The surface of the parish is undulating, and is partly occupied by Soda and Caddo lakes, which communicate with Red river and with each other, and are navigable by steamboats. In 1855 the productions were 11,616 bales of cotton, and 859,675 bushels of Indian corn; value of real estate, \$1,880,780; pop. 9,798, of whom 5,681 were slaves.

CADDOES, an Indian tribe who once occupied the region immediately north of the present Texas line. They have been reduced to less than 800 souls, and forced to take refuge among the Comanches.

CADE, JOHN, the Jack Cade of Shakespeare, an Irish rebel, died July 11, 1450. Early obliged to flee from Ireland, he took refuge in France. In 1450 he passed over to England at the moment of great popular dissatisfaction with the ministers of Henry VI. He at once pretended to be a relative of the duke of York, assumed the name of Mortimer, raised the standard of rebellion in Kent, May 8, and very soon found himself at the head of 20,000 men. He advanced to Blackheath, and interchanged notes with King Henry, to whom he made known the griefs of his companions. He defeated the royal troops which were sent against him, and entering London July 1, immediately caused the execution of 2 of the offensive ministers. At first he kept his army under rigorous discipline, but after a few days' residence in the capital their propensity to plunder could no longer be restrained, and they

pillaged some of the finest houses. This aroused the citizens against them, and on the night of July 5 Cade met with his first defeat. A promise of pardon now dispersed most of his followers, and finding his force no longer sufficient for resistance he took to flight, but was overtaken and killed.

CADELL, ROBERT, a Scotch bookseller, and the publisher of the later works of Sir Walter Scott, died at Edinburgh, Jan. 20, 1849. In the failure of Mr. Constable, his first publisher, Scott was involved to the amount of more than £100,000, and Cadell immediately purchased the printed stock of Scott's books, monopolized the copyrights, and by various improvements in their style of publication increased the interest of the reading community, and the amount and profits of the sales. His talents as a publisher, joined with the vigor of Scott's genius, enabled the latter to meet all his heavy obligations, and to preserve to his family the domain of Abbotsford. At the death of Scott £20,000 was still wanting to secure this result, and this amount was advanced by Cadell, who asked no other security than the profits which would accrue from Sir Walter's copyrights.

CADENOE, in music, a pause at the end of an air, which is followed by an extemporaneous effusion by the performer.—In reading or speaking, the fall of the voice. In such exercises a key-note is generally taken spontaneously, and the fall of the voice below this is a cadence.

CADES, GRUSEPPE, an Italian painter, born at Rome in 1750, died there in 1800. He could reproduce the style of any great master with such accuracy as to deceive the most skilful connoisseurs; which dangerous gift, however, he always exercised in the most honorable manner.

CADET (Fr.), the younger or youngest brother; also, a person who serves in the expectation of a commission in the army, but who receives pay, while a volunteer serves gratuitously. The name cadet is also applied to students in military and naval academies, as, for instance, to those of West Point and Annapolis.

CADET DE VAUX, ANTOINE ALEXIS FRANÇOIS, a French apothecary and chemist, born in Paris, Jan. 13, 1743, died June 29, 1828. He was the inventor of the galactometer, or instrument for ascertaining the quality of milk.

CADI (Arabic, *Kaidon*), an inferior judge among Mohammedan nations. The name is generally applied to functionaries in a village or small town, while the superior judges in a province or a city are called *mollah* or *moula*. The Mohammedans deriving their law from the Koran, the cadis and all other magistrates form part of the higher clergy.

CADIZ, a city and province of Spain in Andalusia; pop. of the province, about 300,000; of the city, in 1857, 61,844. The town is situated on the S. W. coast, on the rocky extremity of a small tongue of land projecting from the

Isla de León; lat. 36° 31' N., long. 6° 17' W. The city fronts the ocean, behind it is the superb bay of Cadiz, the entrance to which from Puerto de Santa Maria is protected by the forts of Matagorda and Pastiles on either side of the channel. The Isla de León is separated from the mainland by the Ito de Santa Petri, which is crossed by a bridge. On the mainland is the great navy yard and arsenal of La Carraca.—Cadiz is the most important commercial and seaport city of Spain, but has declined from the position which it occupied in the glorious period of the Spanish colonial empire, when it was one of the chief maritime cities of Europe. Its position at the entrance of the Mediterranean and south of the peninsula continues, however, to give it great commercial importance. In 1829 it was made a free port, but this privilege produced such a large number of smugglers that it was withdrawn 8 years afterward. This circumstance, and the competition of Gibraltar, Malaga, and other cities, exercise an unfavorable effect upon its commercial prosperity. The imports consist mainly of sugar, coffee, cocoa, indigo, spices, rice, wheat, salt fish, leather, shesos, laces, cottons, wool, linen, silk, iron and brass manufactures, hemp and flax, earthenware, copper, tin, crystal and glass ware; the exports of wines, fruits, brandy, saffron, lead, quicksilver, barilla, raw silk, indigo, cork wood and corks, leeches, paper, gut for fishing and for guitars, cast-iron, guisones (chick-peas), beans, wheat, flour, silk and woollen manufactures, and thread lace. The white wines of Xerez, in the vicinity of Cadiz, form the principal exports, representing an average annual value of \$3,500,000, and a quantity of 20,000 pipes, of which more than 4 go to England. The total exports in 1855 were \$18,000,000, and the imports \$8,000,000. The entrances in 1855 were 997 vessels, tonnage 205,000, and the clearances 963, tonnage 215,000. Cadiz has a joint stock bank, and issues its own notes. The manufactures carried on in the city are soap, glass, coarse woollen, cotton, and silk, hats, sugar, and leather. Cadiz is famous for its manufactures of fans, mantillas, gloves, guitars, and sweetmeats or *dulces*. The town is the handsomest in Andalusia, and is divided into 4 quarters, containing 6 great and 23 smaller squares and 280 streets. The *calle Ancha* is the Broadway of Cadiz. The *Alameda* is a fine promenade. The public edifices are not remarkable: 2 cathedrals, ancient and modern, 2 hospitals, and a *plaza de toros*. There are some fine paintings scattered about the city. One by Murillo, in the chapel of the convent San Francisco, has a melancholy interest, from the circumstance of the great painter having taken leave from the scaffold while painting it, and having died from the fall. Cadiz is the seat of a bishop, of naval and colonial tribunals, and contains 7 churches beside the 2 cathedrals, and 13 convents. There are several hospitals and charitable institutions, 2 custom-houses, an ex-

change, an academy of drawing, a botanical garden, an observatory, and, among other institutions, mathematical, naval, and military schools.—The climate is excessively hot, and the winds of Africa make it frequently very uncomfortable. Cadiz was founded by the Phoenicians, and was the *Gades* of the Romans. The remains of a Tyrian temple of Hercules, with some other buildings of the ancient city, are still visible at low water. The Arabs conquered the city, which was retaken by the Spaniards in 1292. It has been attacked by the English several times, successfully by Peterborough and Blake. In 1810 it was invested by the French, but they raised the siege in 1813 on the advance of Lord Wellington. In modern times it has always been politically conspicuous for the liberations and prompt action of its inhabitants in the several crises of the Spanish constitution.

CADIZADELITES, a sect of Mohammedans, who receive both the Bible and the Koran, believe that Mohammed is the Holy Ghost, praise the circumcised, and drink wine.

CADMIUM. In working hematite iron ores in blast furnaces, an incrustation gradually collects upon the inner walls in the upper and cooler part of the stack, which, when the furnace is cooled after a long blast, is beaten off with difficulty by hammers and chisels. It is stratified in thin layers concentric with the walls upon which it is attached. Its appearance is that of a rich natural ore of some very heavy metal, and for this it has been mistaken. Its colors are reddish and yellow. On analysis it proves to be a compound of oxide of zinc, which is contained in the iron ore in quantities too small to be detected by chemical researches. In the course of a long blast, as this is continually volatilized, the vapor is condensed in the form described, to which the name of cadmium is given. It is common in the blast furnaces of this country and in those which use hematite in Europe. Dr. Beck gives 2 analyses of this substance taken from the old Ancrus furnace of Columbia co., N. Y., which are as follows:

	1	2
Oxide of zinc.....	98.10	95.99
Oxide of iron.....	2.50	4.50
Carbon.....	1.00	0.50

Oxide of lead is also sometimes present when this metal is contained in the ore; and so probably is the metal cadmium, which was first recognized in the similar crust deposited on the sides of furnaces in which zinc ores and brass were treated. The name is derived from the Greek name for zinc ore, given in honor of Cadmus, who introduced the manufacture of brass into Greece.

CADMIUM (Gr. *cadmea*, cadmine). The name was formerly applied to the incrustations of zinc and cadmium, which collect as incrustations upon the inner walls of furnaces in the metallurgical treatment of zinc ores and alloys. These are still called *cadmia*. Cadmium is now the name of a metal which is extracted

from some of the ores of zinc. It is nowhere met with in a native state, nor as a distinct ore, except as the sulphuret, and this is found at only one locality, which is Renfrewshire, Scotland, where it was discovered by Lord Greenock, and for him named Greenockite. It consists of sulphur 22.8, and cadmium 77.7. Its colors are honey and orange yellow. It is nearly transparent, double refractive. Its hardness is 3—3.5; its specific gravity, 4.8; its crystals, short hexagonal prisms. The metal was discovered in 1817, by Stromeyer, in some ores of zinc of upper Silesia. These ores contain 1 or 2, and sometimes 10 per cent. of cadmium. Its presence is recognized by the reddish color of its oxide deposited before the blowpipe upon charcoal, zinc alone leaving a white coating. Cadmium bears a strong resemblance to tin in some of its properties, as in color and lustre. It is a little harder, and requires to melt it a temperature, according to Daniell, of 360° , while tin melts at 442° . It is ductile, so that it may be drawn out into fine wire or beaten into very thin leaves. Its density when melted is 8.6; when hammered, 8.69. It volatilizes a little above its melting point, hence subliming more easily than zinc, taking fire and burning with a thick smoke of brownish or yellow color without smell. When bent it gives, like tin, a crackling sound. It is susceptible of a beautiful polish, and marks paper like lead. At ordinary temperatures it is unaltered, even in moist air; after a long period a thin grayish pellicle of oxide forms upon its surface and protects it from further change. It dissolves in nitric, sulphuric, and hydrochloric acids a little less readily than zinc. The chemical equivalent of cadmium is 56; its symbol, Cd. Only one oxide of the metal is known, the composition of which is cadmium 87.45, oxygen 12.55; it is formed by heating the metal in contact with the air, and in calcining the nitrate or the carbonate of cadmium. The salts are in general soluble and take crystallized forms. They have no color, but possess a nauseous taste and act as emetics. The sulphuret, precipitated by sulphuretted hydrogen, makes a beautiful and brilliant yellowish red pigment, which is very permanent. If alum is added to the solution, the precipitate will be obtained mingled with alumina. The sulphate is obtained by dissolving the carbonate or the metal itself in dilute sulphuric acid, a little nitric acid being added. It is a salt of similar properties to those of sulphate of zinc, but much more powerful. It is used in medicine as a valuable remedy in the treatment of syphilis, rheumatism, and gout; and in diseases of the eyes it is found of great service as an astringent and stimulant, and is particularly beneficial in the removal of specks and opacities of the cornea.—Cadmium is obtained in a metallic state from compounds containing it by precipitating with a current of sulphuretted hydrogen gas from its strongly acid solutions. Zinc, cadmium, and copper, if present, are thrown down

as sulphurets. These are redissolved in nitromuriatic acid; the metals are precipitated by carbonate of potash or soda; the precipitate is then digested with carbonate of ammonia, which redissolves all the copper and zinc. The insoluble remainder is then washed with water, charged with carbonate of ammonia, and afterward with pure water. It is then calcined, and the oxide is reduced to a metallic state by mixing it with lampblack and carefully heating it. Cadmium may also be obtained by precipitating it from its solutions by means of strips of zinc or iron; but it is then always necessary to redissolve and purify it, to obtain it free from zinc and copper. In preparing cadmium in a large way, in working the zinc ores by the process adopted in Silesia, the cadmium, more volatile than the zinc, separates entirely from the ore during the first 4 hours of its distillation. This collects as a yellowish brown oxide, and is found mixed with the white oxide of zinc, which separates in the early part of the process. The browner parts of these sublimations are collected and mixed with $\frac{1}{4}$ their weight of coke. They are then heated at a moderate temperature in a muffle, which is furnished with a sheet-iron neck, kept constantly cool by a current of air. The zinc that comes over first condenses in the upper part of the neck, and the cadmium, which is more volatile, is deposited as a yellowish oxide further from the muffle. The escape of the very volatile cadmium vapor is prevented by a wooden stopple in the extremity of the neck, through which a very small opening only is made for allowing some gas to escape. The oxide of cadmium, thus obtained separate from the oxide of zinc, is mixed with pulverized charcoal and introduced into a cast-iron retort, which is moderately heated. The metal volatilizes and condenses in little drops in the cool neck of the trough. It is then remelted with a little resin and cast in moulds of sand into small cylindrical bars. This is a perquisite of the master founder, and is worth \$6 per lb. It still contains a small proportion of zinc, from which it may be separated in the wet way. The production of cadmium at the great zinc works of upper Silesia has amounted for some time past to only about 1,100 lbs. per annum. If it were not for its rarity and high price, it might be employed to advantage for the same purposes as tin.

CADMUS, a mythological king of Thebes, son of Agenor, king of Phœnicia, and brother of Europa, who is said to have introduced into Hellas the 16 simple letters of the Greek alphabet. He left his native country in search of his sister Europa, who had been borne off by Jupiter. On making inquiry of the Delphic oracle as to what state he should choose for settlement, he was advised to follow a heifer which would meet him. Cadmus found her in Phœcis and followed her into Bœotia, where she sank down on the spot which Cadmus called Cadmea, and which became the citadel of Thebes. He sent some of his company to

draw water from a well sacred to Mars. This well was guarded by a dragon, which slew the intruders. Cadmus slew the dragon, and was directed by Minerva to sow the monster's teeth. He did so, and a host of armed men immediately sprang from the ground, who were called the *Spartoi*, or the *Sown*. These were about to turn upon Cadmus, but the latter threw a stone amid them, and a fight ensued which did not cease until all were slain, except 5. These survivors became tractable and helped Cadmus to build the new city. Cadmus was honored as the founder and patron of Thebes. To recompense him for his perils the gods gave him Harmonia, the daughter of Mars and Venus, for a wife, and honored their nuptials with their presence and with gifts.

CADOUAL, *Genevra*, the leader of the *Chouans* or Breton rebels in the French revolution, born at Kerléan, in lower Brittany, Jan. 1, 1771, guillotined in Paris, June 25, 1804. He was educated at the college of Vannes, and at first shared in the reformatory hopes which the revolution inspired; but the attempts of the assembly against the liberty of the church gave a shock to his religious sentiments, and set him in opposition to all the new ideas. With 50 of his compatriots he joined, in 1793, the Vendean chiefs at Emphres. He was soon arrested and thrown into prison, but escaped in the disguise of a sailor, and became formidable at the head of an army of *Chouans*. After the disaster of Quiberon, he united the remains of the royalist troops, but was unable to make progress against the republican army under Hoche. By his efforts the insurrection was renewed in 1798, but without success, and he was obliged to flee to England. He was received with distinction by the English government, and by the count of Artois, who made him lieutenant-general, and bestowed high titles upon him. In 1803 he returned to Paris, with several other officers, with the design of overthrowing the government. His plot was revealed, and all the efforts of the police were immediately directed to his discovery. He was arrested attempting to leave Paris by a covered carriage, first, however, shooting 2 of the police, and shortly after was adjudged guilty of an attempt upon the life of the emperor. He showed great courage to the last, avowing himself to be the head of the conspiracy, and avoiding most carefully to compromise any of his partisans. His conduct excited the admiration of Napoleon, who would gladly have pardoned him, but the persistent refusal of Cadoual to recognize him as emperor of the French did not allow the bestowal of any favor upon him.

CADUCEUS, a mild and pious sect of Mohammedans, who meet once a week, and spend the night in a rotatory sort of dance, keeping their hands joined, and each repeating the attributes of God; during which one of them plays softly on a flute. They never cover their feet or heads, and never cut their hair.

CADUCEUS, the winged wand which

Mercury received from Apollo in exchange for the lyre. This wand was able to put an end to strife the moment it was thrown between the parties at variance.

CADWALLADER, Jaar, an officer in the war of the American revolution, born in Philadelphia in 1744, died Feb. 10, 1786. He was a member of the Pennsylvania convention in 1773, and at the commencement of the war was commander of a volunteer company, nearly all the members of which subsequently became officers in the army. In 1777 he was appointed by congress a brigadier-general, and took part in the battles of Princeton, Brandywine, Germantown, and Monmouth. He commanded one division of the army in the attack upon Trenton, but was prevented by the ice from crossing the river in season to engage in any thing but the pursuit of the defeated enemy. The intrigues of Gen. Conway against Washington occasioned a duel between him and Gen. Cadwallader. The latter was, after the war, a member of the assembly of Maryland.

CÆCILIUS STATIUS, a Roman comic poet, contemporary of Ennius, and the immediate predecessor of Terence, died 168 B. C. Of his works there remain only a few fragments, and the titles of 40 of his dramas, which indicate his resemblance to the Greek writers of the new comedy. He was highly esteemed by the Romans, and placed in the first rank of comic poets with Plautus and Terence.

CÆCUM (Lat. *cæcus*, blind), a name given in the higher animals to that portion of the intestinal canal into which the small intestine enters; properly speaking, it is the enlarged commencement of the colon. The cæcum is situated in the right iliac region, and is of an irregularly triangular shape, pointed, about 3 times as voluminous as the small intestine which opens into it, and about 3 or 4 inches in extent between the ileum and colon; in front, it is in relation with the abdominal walls; behind, it rests upon the right psoas and iliac muscles, and internally it is in contact with the small intestine. Externally it presents 3 irregular prominences or divisions, separated by longitudinal depressions, 1 anterior and 2 posterior; it has also many fatty appendages contained in folds of the peritoneum; at its lower part, to the left side and in front, is the vermiform or cæcal appendix, cylindrical, sinuous, about the size of a goose-quill, from 3 to 4 inches long, with a cavity communicating with the cæcum. Internally it presents 3 depressions corresponding to the external constrictions which separate them. Beside the opening of the vermiform appendix at its lower portion, on the left side is the ileo-cæcal or Bauhin's valve, guarding the outlet of the small intestine; this valve is elliptical, transverse, formed by a fold of the mucous membrane with two lips, the lower of which contains evident muscular fibres. The cæcum has the usual 3 coats of the intestinal canal; the serous or peritoneal membrane envelops it, except on a small portion of its upper surface; the muscu-

lar coat is composed of the usual circular fibres, and of longitudinal fibres forming 8 bands somewhat shorter than the cæcum, and therefore corrugating it into folds; the mucous membrane has many mucous follicles, few villousities and no proper *calculus constrictans*; the appendix has the same structure as the cæcum. The small intestine is not simply continuous with the larger, but opens into it at right angles to its axis, and at some distance from its commencement; this arrangement leaves a portion of the intestine in the form of a pouch (hence the name *cæcum*), anatomically below the ileo-cæcal valve, but physiologically or in the course of the food, above it; there is no definite limit between the cæcum and the ascending colon. From its situation and structure the cæcum is susceptible of considerable dilatation; in its natural condition the muscular contraction of its fibres is sufficient to close the lips of the valve, and to shut off all communication with the ileum; the office of this valve is evidently to prevent the regurgitation of the digested matters into the small intestine, at the same time that it allows a free passage in the opposite direction; from its projection inward, the greater the disposition of the contained matters to pass backward the closer would the lips of the valve shut, except in the rare cases where the small and large intestines should be fully distended from an obstruction below the valve. The use of the cæcum is evidently that of a receptacle in which the digested matters may be delayed before passing into the colon, for the final extraction of any remaining nutrient materials; its shape, size, and direction adapt it for this, and comparative anatomy goes to prove it; in carnivora, whose food is fully digested in the upper portion of the alimentary canal, the cæcum is very small; while in the herbivora, whose vegetable diet requires a longer digestion by a much slower process, this organ is largely developed; it is probably true that a habitual vegetable diet in man causes the enlargement of the cæcum. The use of the vermiform appendage is unknown; it is generally considered homologous with the cæcal appendages found in the lower animals, especially in birds; foreign bodies, as seeds and shot, are sometimes caught in this appendage, where they may excite inflammation and perforation, causing fatal peritonitis. When the product of digestion reaches the cæcum, it generally contains little more than innutritious, and insoluble and excrementitious compounds; the contents of the canal from alkaline now become acid; by some it is supposed that the acid is secreted by the numerous glands of the part for the more complete solution of any remaining indigested albuminous matters; this was the opinion of Tiedemann and Gmelin, and of Schultz, who believed that in the cæcum a second digestion is accomplished, in a measure proportioned to the activity and completeness of the stomachal digestion; and this view was confirmed by the large size of this organ in herbivora, in which digestion is very far from

being finished in the stomach; but from the experiments of Blondlot it would seem that the lactic acid of the cæcum is rather the product of the transformation of saccharine substances, subservient, nevertheless, to the complete digestion of albuminous matters. In the invertebrates, as in the cephalopoda, the intestine often has cæcal appendages, secreting a fluid, which have been regarded as a rudimentary pancreas.—Fishes have no cæcum, but sometimes cæcal appendages high up; in frogs and toads there is a cæcum into which the small intestine opens laterally, with or without a valve; in some ophiurians the large intestine is divided into pouches, the upper of which is comparable to a cæcum; in the crocodile there is no cæcum, but a valve between the small and large intestine; both are generally present in turtles.—Birds, without having a proper cæcum, have usually 2 cæcal appendages near the commencement of the large intestine; these vary in size from mere rudiments in the goose to processes 8 feet long in some gallinaceous birds; sometimes there is only one, as in the invertebrates and lower vertebrates.—In mammals the cæcum is usually large in proportion to the vegetable nature of their food; in the carnivora it is very small; in the insectivora, cheiroptera, and in hibernating animals generally, it is absent; in the edentata it is usually wanting, but there are cæcal appendages opening into the confines of the small and large intestines, which are not very distinct; in ruminants, pachyderms, and solipeds, the cæcum may be said to be enormous, being $2\frac{1}{2}$ feet long in the horse, and 8 times as capacious as the stomach; and, in the Cape hyrax, provided with 2 additional cæcal appendages; in some rodents it is very large and subdivided by circular folds, and in the beaver is 2 feet long; in the carnivorous marsupials it is wanting; in the insectivorous small; and in the herbivorous 2 or 3 times as long as the body, and the wombat is said to have also a vermiform appendix; in the ornithorhynchus a small cæcum separates the small from the large intestine; in the herbivorous cetacea the cæcum is present, in the carnivorous generally absent; in the quadrumana the cæcum exists, and in the apes there is a well-developed appendix. The situation and physiological office of the cæcum render it liable to many diseases; its mucous membrane is subject to acute and chronic inflammation, to ulceration, to perforation; its size and extensibility make it a favorite part for the lodgment of hardened feces in cases of dyspepsia, constipation, and loss of tone in its coats; it is a common locality for the imprisonment of gases, especially in typhoid fever, in which disease the gurgling movement of air and fluids in the right iliac region is characteristic in certain stages. Inflammation of the appendix and its possible consequences have been alluded to; with this exception, its presence or absence seems to be of no consequence; it is occasionally wanting, or transformed into a solid cord,

or enormously long and convoluted, or variously displaced and adherent to neighboring parts, without any apparent disturbance of the digestive functions.

CÆDMON, the first Anglo-Saxon poet, died A. D. 660. He was a swine-herd to the monks of Whitby, and never gave evidence of any poetical talent until one night a vision appeared to him, and commanded him to sing. When he awoke, he found the words of a poem in praise of the Creator of the world impressed upon his memory. This manifestation of talent obtained for him admission into the monastery at Whitby, where he continued to compose devotional poems. An edition of his paraphrase of parts of the Scriptures was printed at Amsterdam in 1666, edited by Junius. Thorpe published an edition of it (London, 1832) for the society of antiquaries. It has been said that Milton took some ideas of "Paradise Lost" from the poems of Cædmon. It is certain that they were very popular among the English and the Saxon part of the Scottish nation, and furnished plentiful materials to the makers of mysteries and miracle plays. The only manuscript of Cædmon extant is to be found in the Bodleian library at Oxford.

CÆLIUS AURELLANUS, a Latin physician, who is generally supposed to have been a native of Numidia, and to have flourished in the 3d century of the Christian era. He was a member of the sect of the Methodists, and the author of a medical work still highly esteemed. In this work, Cælius divides diseases into 2 great classes, the acute and the chronic, to the former of which classes he devotes his first 3 books, and to the latter the remaining 5.

CÆLIUS MONS, one of the 7 hills on which Rome was built. It is not known by which of the first 4 kings it was added to the city. It is said to have received the name of Cælius from Cælius Vibenna, an Etruscan leader, who settled on it.

CAEN, the chief town of the department of Calvados, France, pop. in 1856, 41,894, on the Orne, 10 m. from its mouth. It was indebted for its importance to the dukes of Normandy, who surrounded it with massive walls, flanked with towers, and erected a castle for its protection. William the Conqueror built here a large church, known as the *abbaye aux hommes*, or St. Stephen's church, where he was buried; while his queen, Matilda, was the founder of another church, the *abbaye aux femmes*, or Trinity church, the elegant architecture of which is a perfect contrast to the austere severity of the former. Under the conqueror and his successors, Caen grew wealthy through its trade and manufactures. Its prosperity continued under the French kings; so that in 1348, when, a short while before the battle of Cressy, it was taken by King Edward III. and the black prince, and given up to plunder, the English found it, according to Froissart's account, "large, strong, and full of drapery and all sorts of merchandises, rich

citizens, noble dames, damsels, and few chardons;" and their fleet returned home laden with its spoils. A second time, in 1417, Caen was taken by the English, and King Henry VI. founded there a university, which became celebrated. In 1450 it surrendered itself to Dunois, and was renowned for its loyalty to the French kings. It suffered a good deal during the civil and religious wars of the 16th century, being, in 1569, pillaged by a party of Huguenots. The revocation of the edict of Nantes (1685) inflicted a deadly blow on its manufactures, by banishing its most skillful artisans. During the revolution, on the fall of the Girondists, May, 1793, several leaders of the party repaired to Caen to organize a revolt against the convention, but were soon put down by the revolutionary forces. From here also Charlotte Corday set out to Paris to assassinate Marat. In more recent times the streets of the city have been enlarged and straightened; squares, the most magnificent of which is that called Louis XIV., have been opened; the castle has been partly demolished, and the portion of it that still remains is a prison; the walls have nearly disappeared, and fine promenades have been planted, the principal being called Grand Cours and Cours Cæsarrell, by the side of the Orne; but the most important monuments and institutions have been preserved. Beside the 3 churches above mentioned, that of St. Peter, near the centre of the town, is noticed for its beautiful spire. The university of Henry VI. has become an academy dependant on the French university. The conventual buildings adjoining the *abbaye aux hommes* have been converted into an imperial college, numbering about 300 students. There are beside a secondary school of medicine, a school of hydrography, a public library, containing about 50,000 volumes; a botanical garden, with a good collection of plants; museum of pictures and natural history; a school for the deaf and dumb, and several other learned and charitable institutions. Caen is a favorite resort for English families, English service being regularly performed in a French Protestant church. The lace manufactures are the most important, and are said to employ 20,000 women and children in and about the town. It is also famous for the manufacture of Angora gloves, great numbers of Angora sheep being reared in the vicinity. The town is an entrepot for salt, and has an extensive coasting and export trade in paving, granite, and building stone. (See CANY BROOK.) Several large fairs are held for the sale of the industrial and agricultural produce of the country. The women of Caen are said to be handsomer than in most other parts of France, and their beauty is still enhanced by the originality of their tall, white Norman head-dress, ornamented with lappets behind, and sometimes with lace. Caen is connected with Paris by a railway, which passes Lisieux, from whence a branch leads to Honfleur. A railway to Bayeux, and from thence to Cherbourg, is in course of construction, and one to

Alençon is projected. A canal, connecting Caen with the ocean, which cost \$1,800,000, was completed in Aug. 1857. The port admits vessels of 150 to 200 tons. In 1854 Caen owned 92 vessels, of an aggregate tonnage of 7,546, and a steamer of 43 tons. The entrances of foreign vessels amounted to 1,374 in 1858, 82,118 tonnage, and the clearances to 1,089, 61,646 tonnage. Malherbe, Auber, the composer, and other eminent persons, were born here, and Beau Brummell and Bourrienne, Napoleon's secretary, both died here in the same hospital for lunatics.

CAEN STONE, a soft cream-colored or light yellow sandstone, which is quarried near the above-described city. The stone, from its soft shade and even grain, and the ease with which it is worked, is highly esteemed for building purposes. It is exported in large quantities, and some of it finds its way to this country. The Nassau Bank in New York city is built of it.

CAER CARADOC, or **CRADOCK HILL**, an eminence near the confluence of the rivers Olyn and Teond, in Shropshire, England, at the top of which traces of the camp in which Caractacus was besieged by the Roman general Ostorius are still visible.

CAERLEON, a market town of Monmouthshire, England, 162 miles from London, possesses much antiquarian interest. It is believed to have been the capital of Wales, and was an archbishopric soon after the introduction of Christianity in Britain. It was a Roman station (*Ica Silurum*). A space of ground which has received the name of Arthur's Round Table, is believed to have been a Roman amphitheatre. There are also remains of an ancient castle, and various antiques have been found. A building has been erected as a museum of antiquities. There are places of worship for the Wesleyans, Primitive Methodists and Baptists, and the parish church has a tower of early English style. Pop. 1,281.

CAERMARTHENSHIRE, or **CAERMARTHENSHIRE**, a county of South Wales, Great Britain, contains 947 sq. m.; pop. 110,682. It is a mountain district, the highest hill being 2,596 feet high. The principal river is the Towy, a stream of great resort for beautiful scenery and angling. Another river, the Taff, is also dear to excursionists. They are small streams, not over 50 miles in length.—Iron, lead, coal, and limestone are the chief mineral productions. Caermarthenshire was the scene of the final struggle for Welsh independence under Llewellyn, last of the princes. The disturbed state of the Welsh marches for many years compelled the erection of baronial castles, of which there are many remains in various degrees of preservation.—The chief town of the county is Caermarthen, a parliamentary borough, 245 miles from London by rail. It is beautifully situated on the Towy, a few miles from the bay of Caermarthen. The town is irregularly built and the streets narrow, but the inequalities of the site give an air of picturesqueness to the

place. There are some ancient remains about the town and in the neighborhood. Steele the author was buried in the parish church of St. Peter. General Picton, one of the heroes of the Peninsular war, and Lord Nott, the Indian general, were born here. Caermarthen possesses a grammar-school, a Presbyterian seminary, a South Wales training college, national British and infant schools, an infirmary, and a literary and scientific institution. The inhabitants are occupied in tin works and iron founderies; and fishing, chiefly of salmon and sewin, is carried on with drag-nets in coracles, a kind of small boats known to the ancient Britons. An active coasting trade is carried on with Bristol. The principal exports are timber, marble, bricks, slates, lead ore, bark, grain, eggs, and butter. Pop. 10,524.

CAERNARVON, **CAERNARVON**, or **CAERNARVONSHIRE**, a county in the northern part of Wales, bounded on the W. and N. by Caernarvon bay and the Menai strait. It has an area of 579 sq. m., and its population in 1851 was 87,870. The surface is mountainous, and is traversed by some of the loftiest ranges in Britain. One-half of the land is barren, but the valleys produce oats and barley. The rearing of cattle and sheep affords employment to many of the inhabitants, and there are mines of copper, lead, slate, and coal, which are worked with some profit. The county is divided into 10 hundreds and 71 parishes.—**CAERNARVON**, or **CAERNARVON**, the capital of the above county, is a parliamentary and municipal borough and seaport town, on the E. side of the Menai strait. The town is defended by a wall and surrounded by suburbs of double its extent, within the limits of which are numerous handsome villas, bathing establishments, and a terrace walk along the strait, terminating in a pier. In the vicinity are also the seats of the marquis of Anglesea, Lord Newborough, Lord Boston, &c., and the site of the ancient Roman station of Segontium. At the W. end of the town stands a magnificent castle, built by order of Edward I.; over the principal gateway is a statue of its founder. The castle and yard together occupy a space one mile in circuit. In a part of the edifice called the "eagle tower," Edward II., the first Anglo-Norman prince of Wales, was born. Caernarvon has a harbor which will admit vessels of 400 tons burden, but its trade is chiefly carried on by small craft and by steamers running to Liverpool. Slate and coal, the former brought by railway from quarries ten miles distant, are the principal exports. Pop. in 1851, 8,674.

CÆSALPINUS, **ANDREAS** (**ANDREA CÆSALPINO**), an Italian physiologist, born at Arezzo, in Italy, in 1519, died Feb. 23, 1603. In his youth he manifested little inclination for study, and still less for the approved scholastic methods of it, and received frequent chastisement from his masters. A change of discipline, however, an appeal to his ambition and an indulgence to his independence, called forth the powers of

his genius. He rose above his fellows, and soon discomfited his teachers in discussions which he raised upon matters in every branch of learning. He is first mentioned in public life as a professor of botany in the university of Pisa. He was subsequently made chief physician to Clement VII., and lived during the remainder of his life at Rome. He published works upon botany, mineralogy, medicine, and the highest questions of philosophy. In his first publication, entitled *Speculum Artis Medicæ Hippocraticum*, his knowledge of the system of the circulation of the blood is stated in the clearest manner. The following passage is taken from the second chapter of its first book: "For in animals we see that the nutriment is carried through the veins to the heart as to a laboratory, and its last perfection being there attained, it is driven by the spirit which is begotten in the heart through the arteries and distributed to the whole body." The system accepted since the time of Harvey could hardly be more definitely or accurately stated. Similar passages are found in other of his writings. His philosophical speculations are contained mainly in his *Questiones Peripateticæ*. This work had great success, especially after it had been violently attacked by Parker, archdeacon of Canterbury, and after a Frenchman named Taurel had gone through with what he called the alpine task of refuting it. The philosophy of Cæsalpinus was scholastic Aristotelianism, with a leaning toward some of the methods and doctrines of the later transcendental or absolute systems. He reduces the world to the simplicity of two only substances, God and matter, and he makes all finite intelligences, all human, angelic, and demoniac souls, to belong to the latter element. Two things are remarkable about his system: 1, the boldness of speculation, unparalleled in his age, with which he seeks a purely scientific view of the universe; and 2, its entirely materialistic character, which must be attributed, at least in part, to the spirit of the time in which he lived. Most kindred philosophic efforts in more modern times, that of Spinoza for instance, have been founded on a more spiritual principle.—But more important than either his anticipation of Harvey's discovery, or his speculative opinions, were his botanical labors. He was styled by Linnæus the first orthodox or systematic botanist, and his work on plants was a hand-book to Linnæus in all his classifications. Botany in the time of Cæsalpinus was the popular witchcraft: as a science, it consisted in a mass of erudition about the imaginary but marvellous virtues of plants. Cæsalpinus sought successfully to transfer it from the realm of magic to that of science. He proposed the basis of classification upon which the whole system of Linnæus rests, namely, the distinction of plants in their parts of fructification. He even, to considerable extent, carried out the principle of the system practically, and defined many classes and orders as they remain in the Linnæan ar-

rangement. Cæsalpinus lived quietly to an old age at Rome, submitting all his speculations to the supremacy of the church, and presenting in his life an example of every virtue.

CÆSAR was the name of several members of a Roman patrician family, of the *Julia gens*, who traced their origin from Iulus, son of Æneas. Made glorious by Julius Cæsar, it was assumed by his adopted son, Augustus Octavianus, and handed down to Tiberius, Caligula, Claudius, Nero, who were, either by adoption or by female descent, still members of the same family, and retained as a name of dignity by their successors of other families. When Hadrian shared his throne with Ælius Verus, he dignified him by the title of Cæsar, which was, after the division by Diocletian, that of the second persons or reigning princes of the empire, chosen by the Augusti. It is the origin of the German Kaiser (emperor), and the Russian czar.

CÆSAR, CAIUS JULIUS, of whom no one writes without quoting the line of Shakespeare,

The foremost man of all this world,

was born precisely 100 B. C., and lived 56 years. The month in which he was born (*Quintilis*) was named July (*Julius*) after him, and the 12th day of that month was his birthday. His father, of the same name, was of prætorian rank, and his mother belonged to the family of Aurelius Cotta. From the earliest age Caius Julius gave evidence of the most extraordinary endowments. He was quick to learn, of wonderful memory, the liveliest imagination, and indefatigable diligence. In his 17th year, having been married to one Cosutia, he procured a divorce in order to marry Cornelia, a daughter of Cinna, then a leader of the democratic party. His aunt Julia had previously married Marius, another great democratic chief; and thus by a double connection Cæsar was brought upon the popular side. Sylla was the master-spirit of the patricians or aristocrats, and, discerning the superiority of the young Cæsar, sought to detach him from the party he had adopted, by persuading him to repudiate his wife. Cæsar, with a spirit which showed the intrepidity of his character, refused to take the advice of the all-powerful Sylla, whereby he incurred his resentment. Sylla stripped him of his wife's dowry, of the fortune he had inherited, and of the office of flamen dialis (priest of Jupiter) which he held. Cæsar deemed it advisable, in this emergency, to quit Rome, and escaping the satellites of Sylla, who tracked him in his flight, he took refuge with Nicomedes, king of Bithynia, in Asia Minor. Suetonius, who was a garrulous court-gossip, tells some scandalous stories of Cæsar's licentious relations with Nicomedes, which only a vulgar mind could repeat or believe. Muncius Thermus was then prætor in Asia, and procured Cæsar to conduct a siege of Mytilene which he did with remarkable energy and success, although but 22 years of

age. The death of Sylla allowed him to return to Rome, where he indicted Dolabella for extortion in Macedonia; but the senate, which was the jury, saved its friend and partisan. In the attempt of *Æmilius Lepidus* to overthrow the senatorial oligarchy, however, he did not take part, having sagacity enough, doubtless, to see that the time had not yet come. Beside, the credit he had gained as an orator in the case of Dolabella put him on the design of cultivating eloquence, for which purpose he set out for Rhodes, to receive the instructions of *Molo*, who, a year or two before, was *Cicero's* teacher. On the way thither he was captured by a band of Cilician pirates, who detained him 88 days. They asked a ransom of 80 talents (over \$30,000), which he laughed at, saying that if they knew who he was they would demand 50. He consented to pay it, but told them that if he ever caught them afterward, he would crucify every mother's son of them. Arrived at the island of Delos, he was set on shore, and paid the ransom; but he immediately organized a small fleet, sailed in pursuit of them, came up with and captured them, and taking them to land, reported their case to the Roman proconsul. But while that magistrate was considering what was to be done, *Cæsar* remembered his threat, and executed the whole gang. He then went to his lessons.—In the year 74 B. C., hearing that he had been chosen one of the pontifices, he returned to Rome, and for a while led a life of pleasure, some say of gross debauchery, winning the good opinion of the people by his affable manners, and a careless, open-handed generosity. In 69 B. C. he was chosen a military tribune, and 67 B. C. a quaestor, in which office he delivered a panegyric on his aunt *Julia*, the wife of *Marius*, and he also caused the bust of *Marius* to be carried in procession, for the first time since the dictatorship of *Sylla*. While he was quaestor he also served in Spain, rather distinguishing himself by his military capacity. In 65 B. C. he was elected *ædile*, and this office, being connected with the public entertainments, gave him an opportunity to display his taste for magnificence. He raised statues to *Marius*, enlarged the theatres, and gave splendid games and festivals. He came out of it several millions of dollars in debt. During his *ædileship*, 63 B. C., the conspiracy of *Catiline* was discovered, and *Cæsar* was suspected of complicity in it; but he had probably too much good sense to involve himself in so desperate and crazy an undertaking; the objects and importance of which, moreover, have been greatly exaggerated by *Cicero*. When the matter came up in the senate, a year later, he effectually quashed such tales. He defended the conspirators, however, from the punishment of death, holding that it would be wiser to scatter them, and keep them under strict guard. At the same time he was aspiring to the place of *pontifex maximus*, one of considerable influence and emolument. *Catulus*, an opposing candidate, offered to pay his

debts if he would withdraw, but *Cæsar* replied that he would borrow more money than that if it were necessary to his success. On the day of election he remarked to his mother that that day would see him either the chief priest of Rome or a dead man. He was elected, getting more votes from the tribes of his opponents than they did themselves. The next year he became prætor, and, on laying down that office, was transferred, as was the custom, to the government of a province. He selected Spain; but before he departed, his creditors seized him, and his friend *Crassus* had to become his security to the amount of nearly \$5,000,000. He achieved not a little military success in Spain in a cruel war against the native tribes, and then hurried back to run for the consulship, the first office of the republic. He was chosen, and administered the government with unexampled vigor. His colleague was *Bibulus*, who attempted in the outset to check him in his objects, but in a short time *Bibulus* was so completely outmanaged that the Roman wits used to say that the two consuls were *Julius* and *Cæsar*. He restrained the unconstitutional powers of the senate, procured the passage of a law for the distribution of lands among the poorer classes, gained the favor of the equestrian order by releasing it from an oppressive contract, and made himself an immense favorite with the people. It was then that he formed his coalition with the great *Pompey* and the immensely rich *Crassus* which is known as the *triumvirate*.—At the close of his term, he was given the government of *Cisalpine Gaul*, with *Illyricum*, for 5 years; and the senate, the more effectually to get him out of the way, added *Transalpine Gaul* (*France*) to the charge, 59 B. C. This opened a new career to *Cæsar*; he had hitherto served in civil employments chiefly, but was now to engage in a labor which would test his military talents. The Romans were asked to settle the disputes of the Gallic tribes, warring among each other for the ascendancy, and also to help them repulse the *Suevi* (*Germans*), who were beginning to invade and lord it over the country. *Cæsar* took the matter in hand, drove off the *Germans*, quelled several revolts of the Gallic tribes, and finally determined the subjection of the province. In 8 years of bloody and brilliant struggles, during which his term was prolonged for another 5 years, he reduced the whole of Gaul, crossed the *Rhine* twice, and landed, the first of the Romans, twice in *Britain*. *Pompey*, his great rival, now procured a law recalling *Cæsar*, who refused to obey, and was threatened with being declared the enemy of the republic. The tribunes of the people refused to confirm the decrees, when the senate, treating their negative with contempt, outlawed *Cæsar*, and directed the consuls "to provide for the safety of the republic." The tribunes repaired to *Cæsar*, who had now by means of their accession got the law on his side, and he immediately passed the *Rubicon*, a small stream

separating his provinces from the territories of the republic, in order to march upon Rome. This act was equivalent to a declaration of war against the senate, who prepared for their defence. Pompey acted as their commander-in-chief, but the popular feeling soon manifested itself so decidedly in favor of Cæsar, that the senatorial party ran off to Greece. Cæsar pursued them there; and then for years a war raged which led Cæsar into Spain, "to defeat the army without a commander before defeating the commander without an army;" all over Italy; into Thessaly, where the great battle of Pharsalia, or Pharsalus (48 B. C.) decided for him against Pompey; in Egypt, where he wept at the sight of the head of his great rival, treacherously killed there, and where he decided in favor of the charming Egyptian woman, the dispute for the throne between the last Ptolemy and Cleopatra; into Pontus, against Pharnaces, son of Mithridates, where he could say *veni, vidi, vici*; into the province of Africa, where he defeated M. Scipio, but could not conquer Cato, who preferred, at Utica, a noble death to life under the rule of a single man. The details we cannot give; but the more grand result was that Cæsar was proclaimed by popular gratitude dictator for ten years. The rapidity of his marches, the energy of his habits, his mastery of resources and men, indicated him as the only person living capable of controlling and ruling the boundless and turbulent state. He set to work reorganizing the nation, though personally interrupted by the remains of the senatorial party. The sons of Pompey rose against him in Spain, which compelled him to go thither and crush them (at Munda 45 B. C.); on his return, he was hailed as imperator, and invested with sovereign powers; the appellation of *Pater Patrie*, "the father of his country," was voted him; the coins were stamped with his image; and he was allowed to wear at all times a crown of laurel on his head. This excess of subservience on the part of the multitude, won and demanded by his triumphs, and his more than kingly show and extraordinary liberality, kindled anew the jealousy of the aristocratic faction, and must have disgusted all the more moderate. But the gross flattery of the new and servile senate carried matters to a still higher pitch of adulation. They ordered the statues of Cæsar to be carried in the processions along with those of the gods; they dedicated temples and altars to him, and appointed priests to superintend his worship. Cæsar is said to have been pleased with these impious homages; yet the story is inconsistent with another, which represents him as eager to possess the title of king; he that was already a god, need not have cared about an inferior title. At any rate, the latter story was believed, and a number of young patricians availed themselves of the Roman aversion to a monarchical title as a cloak to a design for Cæsar's assassination. Gaius Cassius was the ostensible leader of this conspiracy, assisted by the stern Brutus, who was persuaded to sacrifice his benefactor,

as his assassin sacrificed his sons, to the republic, not reflecting that it was easier to save a young than a decaying and corrupted state. Cæsar was absurdly engaged in his refusal of the government, and in the endeavor to consolidate the public order, to which end he had projected and partly executed several vital measures. While thus restlessly engaged he was, though warned, it is said, by signs and dreams, surprised by the blows of the conspirators on the Ides of March (44 B. C.); wrapped in his toga, he sank, covered with wounds, at the foot of the statue of Pompey; and Rome was again plunged into civil war, and became a prey to the prodigant Antony and the selfish Octavius. The heads of the conspiracy, Brutus and Cassius, fell at Philippi (42 B. C.).—As a general Cæsar stands in history among the first, having no equal except the modern Napoleon; as a statesman, the highest rank is conceded to him; as an orator he was compared to Cicero; and as a writer, he surpassed Xenophon, and was only less than Tacitus. He was what the Germans call "a many-sided man," touching life by every fibre, and great in every thing that he touched. Beside his masterly "Commentaries," the memoirs of his own life, he wrote on grammar and on rhetoric; he wrote tragedies, satires, and lyrics; he reformed the calendar as well as the state; and all the accounts agree in representing him as the most perfect gentleman of his day. In one thing, however, he was deficient; his moral sensibility was not equal to his intellectual acuteness or to his force of will; and the record of his life is stained by acts of profligacy, by cruelty, and by a terrible and needless waste of human life. In person, Cæsar was tall and spare; his face was generally pale, his body weak and subject to epileptic fits; and it was his mind alone which made him master of the world. He was extremely nice in all his tastes, but not fastidious; amiable and courteous, but very decided; careful of the feelings of his friends and generous to his enemies, except when he deemed those enemies incorrigible, when he became as stern and remorseless as an oriental tyrant. Niebuhr calls him a "democratic man," driven restlessly onward by the impulses of his genius, vastly in advance of all his contemporaries, but at times sinking himself, through ambition, to their level.—His great works are the *Commentarii de Bello Gallico* and *de Bello Civili*. The first is in 7 books, containing the incidents of so many campaigns; an 8th book was afterward added by another hand; it contains an account of his actions while in Gaul, during which time he invaded Britain and Germany. The second describes his contest with Pompey until the time of the siege of Alexandria. It is not known when he published the first, but it was probably about 51 B. C.; the second was published 47 B. C. Both these works were written immediately after the events occurred, and are therefore important as authorities; they contain much geographical and military information,

especially the latter; so much so that Napoleon consoled himself at St. Helena by studying the marches and exploits of this great commander. His style is noted for its simplicity, naturalness, and purity, for which qualities nothing in the Latin language can be compared to it. Cæsar's veracity has been called in question by Asinius Pollio (Suetonius, 56), and by several writers afterward; Schneider, particularly, advances the opinion that the object of his first work was political, to give the public a favorable idea of his talents, and to confound the plans of his enemies who were attempting to destroy his popularity; and of the second to appease the anger of the partisans of Pompey, who considered him the support of all true patriots. This opinion has been very ingeniously maintained, but the greatest difficulty is to reconcile it with the simplicity of Cæsar's style. Cæsar is mentioned in terms of unqualified praise by Cicero in his "Brutus." Tacitus also, in his "Germania," calls him *summus auctororum divus Julius, auctor* here, as frequently in the classics, meaning "historian." The genuineness of these "Commentaries" has also been questioned. Julius Celsus, at Constantinople, published an abstract of Cæsar's Commentaries, from which arose the report that he was the original author; it is without foundation, as there is a previous Greek translation of Cæsar by Planudes. Many think, and with reason, that Cæsar wrote a diary; Servius has a passage which is not in our copies, under the title of "Ephemera," and Plutarch has one under the same title which has come down to us, showing that some thing of the kind was written by him. He left some orations, letters, apophthegms, a treatise on Analogy, Anticato, &c., all of which are lost, except the letters which are preserved in the works of Cicero. The supposed author of the 8th book, and also of the additions to the civil war, is Aulus Hirtius, a legatus of Cæsar, who died 1 year after him at Mutina (now Modena), where both the consuls Hirtius and Pansa were slain. It has been thought that Hirtius wrote the *Bellum Hispanicum*, but the style shows it to be the work of a different hand. The ancients had something very nearly resembling our newspapers, in what were called *acta*; they originated during the consulship of Cæsar, 59 B. C., who first published the proceedings of the senate; these were continued until the time of Augustus, whose policy forbid the publication of these proceedings, although a private register was kept; he allowed, however, the public acts of the people to be published. There have been many editions of Cæsar's works; the *editio princeps* was published at Rome in 1469, being, therefore, among the earliest of printed books; a good edition is that of Oudendorp, Stuttgart, 1822; and of Herzog, Leipzig, 1831-'34.—The ancient authorities for the life of Cæsar are the biographies by Suetonius and Plutarch, the letters and orations of Cicero, and the histories of Dion Cassius, Appian, and Velleius Paterculus.

CÆSAR, SIR JULIUS, an English civilian, born at Tottenham in 1557, died April 28, 1636. He was educated at Oxford, and studied in the university of Paris, where, in 1581, he received the degree of D. C. L. He was appointed to high offices under Queen Elizabeth, and under James I. was knighted, made chancellor of the exchequer, member of his majesty's privy council, and master of the rolls. Under Charles I. also he was privy councillor.

CÆSAREÆA, a ruined and desolate coast town of Palestine. Its walls, market places, and churches are still partially standing, though greatly decayed. This town was founded by old Syrian kings, but was enlarged, fortified, and adorned with splendid buildings, just before the Christian era, by Herod the Great, who gave to it its present name, in honor of Augustus. It is memorable in the apostolic travels of Peter and Paul, became under the Romans the capital of its province and the residence of the Roman proconsul, and received new favors from Vespasian and Titus. It was taken in 635 by the Saracens.

CÆSAREAN, or CESAREAN, OPERATION, the taking of a child from the womb by cutting, so called from Julius Cæsar, who was said to have come into the world in this way. This operation was first performed on women who died in childbirth before the child was born, and as a means of saving the life of the infant, which would otherwise have been lost, as well as that of the mother. After the publication of the work of Eucharius Roslein, at Worms, in 1513 ("The Rose Garden for Midwives and Pregnant Women"), and the improvements in obstetric science made by Vesalius in Padua, 1543, the Cæsarean operation was not only performed in all such cases, but was commanded by law, as a means of saving the life of the child. In 1581 Francis Rousset, a surgeon in Paris, published a treatise, in which he gave proofs of the possibility of safely performing the Cæsarean operation on the living mother, in cases of malformation and impossible natural delivery. He also first gave the present name to this operation, which from that time forward has often been performed on the living mother with complete success, though not invariably.—When from any cause the antero-posterior diameter of the superior strait of the pelvis, or the transverse diameter of the lower strait, is not more than $1\frac{1}{2}$ inch, the head of the child cannot pass, and there is no possibility of delivery *per vias naturales*. It then becomes necessary, if the child be living, to resort to the Cæsarean operation as the only means of delivery. Dr. Churchill, who is one of the highest authorities on this question, states "that in cases where the patient cannot be delivered by any other means, and when, consequently, both mother and child would inevitably die, a chance of saving the lives of both is afforded by the Cæsarean section." In this operation the walls of the abdomen are carefully opened in front of the uterus, which is also opened, and the child is taken di-

nately from the womb, in lieu of passing through the natural descent. The best period for operating is at the commencement of the labor, provided there be no doubt as to the necessity. The strength of the parturient woman is then unimpaired; she can bear the operation better, and runs less risk of infection.

CÆSIUS BASSUS, a Roman lyric poet of the time of Nero, praised by Quintilian as second only to Horace. He was the friend of Persius, and is thought to have perished by an eruption of Mount Vesuvius.

CÆSTUS, or *Cæstra*, in classical antiquity, a garland used by pugilists at the public games. The æstus covered the fist and wrist, and extended frequently to the elbow. Originally the æstus was nothing more formidable than thongs of leather; in later times knots of lead and nails were added.

CÆSURA, in Latin poetry, the name given to a division of the verse by one or more pauses.

CAF, a mountain fabled by the Mohammedans, which encircles the whole earth. It is the home of giants and fairies, and rests upon the sacred stone Sakhrul, one grain of which gives miraculous powers to its possessor. This stone is of an emerald color, and its reflected light is the cause of the tints of the sky.

CAFFARELLI, *FRANÇOIS MARIE ANTOINE*, a French general, born Oct. 7, 1766, at the chateau of Falga, Haute Garonne, died Jan. 23, 1849. At the beginning of the revolution he was employed in the Sardinian army, but joined the army of the republic as a simple dragon. In 1804 he was charged with the mission to Rome to induce the pope to come to Paris to perform the ceremony of Napoleon's coronation, and on his return was made governor of the Tuilleries. He was wounded at Amstutz, accompanied Prince Eugene in Italy, and took a part in the war in Spain. In 1814 he was chosen by Napoleon to conduct the empress and their son from Paris to Vienna. He retired from public life after the battle of Waterloo.

CAFFARELLI DU FALGA, *LOUIS MARIE JOSEPH*, a French general, born at Falga, Feb. 18, 1786, died in Syria, April 27, 1799. He protested against the right of the national assembly to dethrone the king, and was dismissed from the army and imprisoned. Being released and reinstated, he distinguished himself in the army of the Rhine, under Jourdan. He accompanied the expedition of Napoleon to Egypt.

CAFFEINE, the active principle in coffee, first extracted by Rengé in 1820. It is a weak alkalioid, identical in chemical composition with theine, the active principle of tea. Being found in all the varieties of coffee as well as of tea, which are used as drinks by a large portion of the human race, it no doubt possesses some properties of importance to the animal system. Very few other substances contain so large a proportion of nitrogen gas as caffeine, its percentage of this element amounting to 21.6. Its composition, as shown by Liebig, is represented

by the formula, $C_8H_8N_4O_2$, by which it appears to be closely related to some of the nitrogenous constituents of bile, or taurine. It is obtained crystallized in long silky needles of a white color, which are fusible and volatile, and are easily dissolved in water, alcohol, and ether. To a decoction of coffee or tea, acetate of lead is added to precipitate the calcotannin acid. This is separated from the solution by filtering, and the excess of lead is removed by its precipitation by sulphuretted hydrogen. The liquor again filtered is then evaporated, and the caffeine crystallizes. It is purified by dissolving and again crystallizing. The quantity obtained from coffee is generally about 1 per cent., which is only $\frac{1}{2}$ the amount furnished by tea; as the infusions are prepared, however, for ordinary use, more of the active principle is contained in a cup of coffee than in one of tea. Robiquet and Boutron give much larger proportions than 1 per cent. In Java coffee they found 4.4 per cent. of caffeine, and in Martinique coffee 6.4 per cent. Caffeine has a bitter taste, and acts powerfully upon the system when taken in doses of from 2 to 10 grains. It causes palpitation of the heart, great irregularity of the pulse, oppression in the chest, and pain in the head, confusion of the senses of hearing and seeing, sleeplessness and delirium. The substance may be recognized by its great volatility, and the property it possesses, when dissolved in nitric acid, evaporated to dryness and exposed to ammoniacal gas, of giving a pink-colored bluish.

CAFFILA, a company of oriental travellers. It differs from the caravan only in being in the employ of a single sovereign, and in being organized for a single common object; while the caravan is composed of merchants, each acting on his own account, and without organized or permanent union.

CAFFRARIA AND CAFFRES, a country and a race of men in the E. part of South Africa, from the N. E. frontiers of the Cape Colony, about lat. 32° S., to Delagoa bay in lat. 26° S. Caffraria is bounded on the west by the Transvaal republic. The inhabitants, or Caffres, from whom the land receives its name, were so called by the Mohammedans, who applied to them the Arabic name *Kaffir*, or unbeliever. The men are powerfully and symmetrically built, the females superior in beauty to the other native races of southern Africa. The complexion of the southern Caffres is brown or copper color; it becomes darker as you advance north, until it is deep black. Their hair is black and woolly; the nose and forehead approach the European type; the cheek-bones resemble those of the Hottentot, and the lips are thick and prominent. They have but little beard. Their language is tolerably rich, and superior to the speech of the Bosjesman and Hottentot. Their government is patriarchal; a petty chief presides over every kral or hamlet, and is tributary to a higher chief. These higher chiefs owe allegiance to the *Umkhankani*, or great chief, and form the national council. They live

by the raising of cattle and hunting. Their agriculture is attended to by the women. They have no notion of a Supreme Being, but are devout believers in witchcraft and spirits, and the shades of their ancestors. A Caffre swears by the spirit of his ancestor. Their charmers, rain-makers, and prophets exercise great power. They circumcise the boys at the age of 12 or 14, and abhor the flesh of swine and all fish except shell-fish. Christianity has not made much way among them, although missionary stations have been planted there for 40 years. The great stumbling-block is the Christian doctrine of monogamy. Their huts are hemispherical, thatched with straw and plastered with cow-dung. There is no chimney; the fire-place is in the centre. They preserve their millet in pits dug in the ground. The men often go totally naked. The Caffres are divided into 4 tribes: 1, the Amakosa, who border upon the British settlements; the Caffre war of 1847 resulted in stripping them of the greater part of their territory; 2, the Amatemala or Tambookia, whose westernmost territories border on the back territory of the colony toward the sources of the Great Key; 3, the Amponda or Mambookia, and 4, the Zoolah or Zooloo, who inhabit the northern portion of Caffraria and extend far inland. Their territory has been much diminished by the British and Dutch settlers. Their native weapons were clubs and javelins, but they have learned the use of firearms from their enemies, and are very formidable opponents in mountain and bush warfare.—British Caffraria extends from the Keiskama to the Great Key river, and is divided into the counties of Northumberland, York, Sussex, Middlesex, Cambridge, Lincoln, and Bedford. The capital is King William town on the Buffalo. The principal forts are Wellington and Cox. The Caffre population of this territory has been partially won over to civilization. The importation of arms, gunpowder, and spirituous liquors among them is strictly forbidden. The territory was finally annexed Dec. 23, 1847. The climate of Caffraria is healthy and well adapted to the European constitution. The country is beautifully wooded, rising in terraces from south to north, and is watered by several rivers. The aloe, the gum-tree, and the plantain abound; lions, elephants, hippopotami, and rhinoceroses are to be found, but are becoming rare.

CAFFRISTAN, or KAFFRISTAN, a region amid the Hindoo Koosh mountains of Asia, between lat. 35° and 36° N. and long. 69° 20' and 71° 20' E. The country consists mainly of snowy mountains and sterile hilly districts, but has also a few small and fertile valleys, which produce abundance of corn and fruits. The houses are built on or rather in the slopes of hills, and placed one above another, so that the roof of the lower house forms a pathway to the one above it. Caffristan received its name, which means "the land of the infidels," from the circumstance that the oc-

cupants of this region could never be converted to the Mohammedan faith. They are described as a fine and handsome race. In government they have no common chief, but each tribe obeys a leader of its own, and they are all united only in hatred to the Mohammedans. No Caffre is deemed worthy of honor till he has killed a Mussulman. In religion they are said to acknowledge one supreme God, but they also give worship to numerous intercessorial idols. Their language resembles the Sanscrit, and is spoken with considerable variations of dialect in the different valleys.

CAFTAN, the national garment of the Persians and Turks. It is a loose, flowing robe, generally white, and ornamented with intricate flowers.

CAGAYAN, a province of Luzon in the Philippine archipelago, the largest and least productive division of the island. It extends from Cape St. Vincent, the northern extremity of the island, in lat. 18° 40', to 17° 10' N.; and from the Pacific ocean, its eastern boundary, to the Sierra Madre range of mountains, which bounds it on the west, the distance is about 75 miles; area 9,102 sq. m.; pop. in 1849, exclusive of wild races, 85,839. The large river, called Cagayan, Sallo, and Aparri, at different points, by the natives, but named the Tajo or Tagus by the Spaniards, flows through this province from south to north. This river is navigable by vessels drawing not more than 13 feet of water, for a distance of 75 miles. At its mouth, on the left bank, is situated the town of Aparri, having about 7,000 inhabitants. There is a good harbor at this place, which affords shelter to the numerous fishing fleets, which find profitable occupation in Balingtang straits, and in the vicinity of the Babuyan group of islands. The waters of the Cagayan Tagus are famous for the great abundance of good fish which they contain. Indeed, the land is less productive than the water; the soil of Cagayan, which is exposed to a humid and stormy climate, produces only maize for food, and some indigo and tobacco for exportation; but it affords excellent pasture for hardy breeds of horses and cattle, which are in considerable demand at Manila and in the southern portions of the island. This rigid soil and ungenial atmosphere are also favorable to the development of the most energetic and intelligent of the Philippine brown races. The bravest soldiers in the Spanish East Indian armies are obtained from this province; and those active and skilful sailors, so much in demand by East India merchantmen, and commonly known as "Manila men," as they are generally shipped at Manila, nearly all come from Cagayan. The Spaniards give the native Cagayans a high reputation for honesty; and Catholic priests, in their accounts of missions in this province, represent in glowing language the frank and truthful nature of the inhabitants. Beside this dominant, and most numerous brown race, there are to be found in the rocky fastnesses of the Caravillos and Sierra

Malay ranges of mountains, many tribes of Aetas, or dwarf oriental negroes; those east of the Tagas, known as *Negros caribos* Brown; and the tribes west, as *Ispahs calayan* Brown. These singular, unattainable little savages are the past of the brown and civilized races. The prosperity of the province is much retarded by the frequent destructive forays of the Negrito mountaineers, into the cultivated lands of the civilized Cagayans. Spanish missionaries, so successful elsewhere in Luzon, after making numberless utterly fruitless efforts to produce a civilizing influence among these tribes of Aetas, have deemed their extermination or enslavement imperatively necessary; but the government of the Philippines, which has generally been guided by a humane policy, has declined to adopt measures for that purpose. The number of the wild inhabitants in Cagayan has been variously estimated by Spanish authorities at 7,000 and 10,000. Iron ore, in great abundance, is found in this province, and grain gold in alluvial deposits. The chief wild animals are the deer and the hog; the latter being as plentiful in the forests of Cagayan as in the neighboring Babuyan islands, which resolve their name from this circumstance. Many of the forest trees are of superior quality for shipbuilding; and ebony and sapan-wood are produced.

CAGAYAN SOOLOO, an island of the Malay archipelago, in the sea of Mindoro, intersected by lat. 7° N., and long. 118° 33' E.; area, 85 sq. m.; pop. about 14,000. This island was visited by the companions of Magellan in 1511, and Pigafetta speaks of it as being inhabited by a race of Moserah pirates, much resembling, in splendid warlike accoutrements and well-ordered system of military organization, their Saracen contemporaries on the shores of the Mediterranean. The piratical character of the island, as also of the rest of the Sulu group to which it belongs politically, has been preserved, but the political organization has declined. The great vikings of Cagayan Sooboo, who went forth during the 16th and 17th centuries, with fleets equal in numbers and force to those of a Scandinavian Hells or Hastings, to ravage the most remote islands of the archipelago and even the coasts of Asia, have been succeeded by a number of petty chieftains, who, with one or half a dozen war prahs, occasionally plunder a Chinese junk, or a Bugianese padewakan, and sometimes an unarmed European colonial ship. When piracy becomes unprofitable by reason of the surveillance of a European ship of war, a little commerce is carried on with the northern ports of Borneo in tetrap and tortoise-shell, and with China in birds'-nests. The people of this island resemble the Malay race in appearance, but speak a language entirely different, partaking somewhat of the character of the Tagala in construction, and having a large portion of words used in the several Philippine languages. The Sooboo language is more guttural than any other

spoken in the Malay archipelago. The Arabic character is used in writing. The Cagayan Islanders cultivate rice, and have enclosures of well-assorted fruit-trees; they plough with oxen, rear a variety of domestic poultry, make for themselves very handsome and tastefully ornamented garments, and fabricate their own weapons, and agricultural and other implements. The island has been visited several times lately by Spanish ships of war, and by Spanish agents, and is now regarded, though by no means conquered or taken possession of, as a dependency of the government of Manila.

CAGLIARI, the southern part of the island of Sardinia, divided into 4 provinces, Cagliari, Iglesias, Isili, and Oristano, and a capital of the same name (formerly *Cavaliis*), which is situated in a recess on the southern coast of the island, in lat. 39° 13' N., long. 9° 7' E. It is built on the slope of a steep hill which rises from the coast, and it presents an imposing appearance from the sea. The highest part contains the principal public buildings—the castle, with the viceregal palace, the cathedral, built during the 14th century, and the university, with its 4 departments of theology, law, medicine, philosophy, and belles-lettres, and having 24 professors and 300 students. Cagliari has also a public library of about 20,000 volumes; a museum containing medals as old as the Carthaginian period, several public seminaries, many churches, and 21 convents. It is the see of an archbishop, the place where the states-general of the island assemble, and the principal port of the island. Its more important exports are corn, oil, wine, tobacco, firearms, and soap. During the occupation of Sardinia continental by the French at the beginning of this century, the king of Sardinia took up his residence at Cagliari. A submarine telegraph communicating with Bonn, in Algeria, and another with Malta, have been in operation since 1857. Pop. about 30,000.

CAGLIARI, BAY or, a bay of the Mediterranean, on the S. coast of the island of Sardinia, between Capes Pola and Carbonara, 37 miles wide at its mouth, with secure anchorage. The salt-works here yield about 6,000 tons annually.

CAGLIARI, or CAGIANI, PAOLO, commonly known as PAUL VERONESE, a distinguished painter of the Venetian school, born in Verona about 1528, or according to some authorities in 1530, died in 1588. His father, Gabriello Cagliari, a sculptor, instructed him in drawing and modeling; but the pupil seized the opportunity to enter the studio of his uncle, Antonio Badile, a Veronese painter of some eminence, from whom he acquired the elements of that sumptuous style for which he is distinguished. After executing some designs in fresco on the dome of the cathedral at Mantua, for the cardinal Gonzaga, finding his native city overstocked with painters, he repaired to Venice, where he passed the remainder of his life. For a time he employed himself in studying the works of Titian and Tintoretto and soon took his place

among that illustrious trio who made the school of Venice famous long after the art had begun to decline in other parts of Italy. The work which first brought him into notice was the story of Esther, painted on the ceilings of the church of St. Sebastian, under which the artist lies buried, and which, from the number of his works to be found in it, is an appropriate monument of his genius. The subject was calculated to exhibit his lively invention and talent for depicting ornamental accessories, and thenceforth the Venetians were never tired of employing an artist who could minister so acceptably to their luxurious and splendid tastes. A journey to Rome in the suite of the Venetian ambassador, Grimani, enabled him to study the works of Raphael and the elder masters, whose severe simplicity, however, could not divert him from the style he had already adopted. His history after his return to Venice is a record of great works executed, of which a prodigious number, some of almost colossal dimensions, left his studio. He was amiable, accomplished, and pious, and above all, was distinguished for the generous profusion with which he distributed his paintings among churches and convents. He would seldom take from them more than the price of his canvas and colors, and for his great picture of the marriage in Cana, painted for the refectory of the convent of San Giorgio Maggiore, received, it is said, the insignificant sum of 90 ducats.—No painter ever more frequently violated the proprieties of chronology and costume, or more openly disregarded fact and probability; and none, perhaps, has so magnificently redeemed his errors. In his picture of the family of Darius brought before Alexander, formerly in the Pisani gallery, but recently purchased for the British national gallery at an outlay of £14,000, the men are Venetian soldiers, senators, and citizens, the women are Venetian ladies, the architecture is of the ornate 16th century style, and the costume of the same period. In the "Rape of Europa," now at Vienna, Europa is a noble Venetian dame, sumptuously attired, and her attendants are modern maids of honor. But the celebrated picture of the marriage in Cana, 30 feet by 20, now in the Louvre, is one of the best specimens of his representations of festive meetings, on which his reputation principally rests. There are 3 other festival pictures on a similar scale with the marriage in Cana, and quite as well executed, although not perhaps so well known: Christ entertained by Levi, now in the academy of Venice; the supper in the house of Simon the Pharisee, with Mary Magdalene washing the feet of Christ, now in the Durazzo palace at Genoa; and the supper at Emmaus. Of his more purely religious subjects, the 3 pictures representing the death of St. Sebastian, in the church of that name in Venice, are among the finest for color and composition he ever painted. His scriptural, mythological and allegorical pictures are almost innumerable, and many excellent specimens are to be found at Milan

and in the Louvre. Of his allegorical subjects, his Venice crowned by fame, on the ceiling of the Maggior Consiglio hall, is an admirable specimen.

CAGLIOSTRO, ALESSANDRO, count, an Italian adventurer, whose real name was GIUSEPPE BALSAMO, born June 2, 1743, in Palermo, died, after having swindled and mystified persons of all nations, and been condemned by the inquisition at Rome, in the dungeons of Fort San Leon in the duchy of Urbino, in 1795. Goethe bore evidence to the honorable poverty of his family, whom he visited and assisted during his stay at Palermo. The future Cagliostro made his debut in 1758, when he ran away from the seminary, where he had been placed by his guardians, who brought him back and sent him to a convent at Cartagiere. Here he insinuated himself into the good favor of an apothecary, who initiated him into some of the mysteries of his craft, but had to dismiss him on account of the vicious propensities which belonged to his temperament, and which, on his return to Palermo, degenerated into the most infamous habits. By 1769 he had succeeded in establishing for himself all over Sicily the reputation of a most dangerous, but at the same time of an exceedingly shrewd fellow. Sicily became too hot for him, and he made his exit in a characteristic manner by obtaining money from a confiding goldsmith, under the pretence of helping him to a treasure. With this money he set about travelling, in company with a strange being of whom nobody ever knew whence he came. One of the great means with which Cagliostro played upon the public credulity was to surround himself with the most impenetrable panoply of mystery, and in this respect his travelling companion, whom he baptized by the mystic name of Alhotas, was of great service. In travelling, his policy was to assume a different name and character in every different country, now appearing as a necromancer, then as a nobleman, again as a naturalist, or as a learned physician, while the daily exercise of old tricks and the concoction of new ones imparted an inexhaustible elasticity to his inventive genius. With Alhotas, he explored Greece, Egypt, Turkey, and Arabia. At Medina he was the guest of a distinguished mufti. He became a great favorite with the sheriff of Mecca. His smattering of medical science operated like a talisman. His audacity grew with his success. In 1770 he honored the grand master of the knights of Malta with a visit, and introduced himself as the count Alessandro de Cagliostro, a name which he invented for this special occasion, and which he preserved on account of its euphony. His subsequent brilliant career was due to this lucky interview, as the commander of the knights of Malta supplied him with letters of introduction, which, crowning the adventurer's long-cherished plans, gave him, for the first time, access to the Italian nobility. Fearing, however, that this recommendation would not be sufficient, after his arrival at

Venice he married a beautiful woman, Lorenza Felisiani, and travelling with her through upper Italy she succeeded in making dupes, by her feminine cunning, in quarters where his masculine deceptions failed to be effective. Her special mission was to captivate the hearts of the people, while he, by turns doctor, naturalist, alchemist, freemason, fanatic, orator, spiritualist, necromancer, exorciser, seized hold of the mind and the imagination, always with an eye to the pocket of his victims. After having done an excellent business in Italy, he made his appearance in Germany, in which country he invented an elixir that insured perpetual life and never-fading beauty. Women, whose proneness to credulity had ever been used by him with infinite advantage, became still more attracted toward him by the salutary effects of his wondrous elixir, the operation of which, he used to say, was manifest upon his own person, as he frequently passed himself off for 100, 150, or 200 years old, his wife assisting him in this chronological deception by speaking of her son as being a captain in the naval service of the king of Holland, and 50 years old, while she herself hardly looked older than 20. After having completed his tour through Germany, which must have added considerably to his extensive fortune, and bent as he was on making the conquest of credulous people in Russia, instead of repairing at once to St. Petersburg, he first paved his way to their imagination by the prestige of his career in Courland, in which country he halted on his way, especially as he knew that many of the Russian nobility resided there. In 1779, while at Mittau, he gathered around him the first ladies of the town, and founded, as he alleged, at the suggestion of supernatural powers, a masonic lodge, in which high-bred females would be admitted as members. He conjured spirits before the nobility of Mittau, and delivered mystic lectures. The gentlewomen of Courland, and especially Elisa von der Recke, worshipped at the feet of Cagliostro, who, with his usual tact, left before the enthusiasm of his victims had reached its climax, and made for St. Petersburg via Warsaw. But here he was doomed to disappointment. Catharine II. laughed at him, and at his female disciples of Courland, and wrote a satirical play on the subject which expressed more than she chose to say. He left Russia for France, and arrived at Strasbourg in 1780, where he at once went to work upon the bishop of that city by eliciting, under his eyes, some happy cures, or at least making the good prelate believe that they were so. The news of this miracle spread over France. The Parisians received the charlatan with open arms, and in 1785 he took up his abode in the *Marsis*, in the *rue St. Claude*. His laboratory became thronged with amateurs anxious for cures and communion with spirits. Here he revived an old Egyptian masonic order, of which he became the grand kophite, whose chief mission it was to impart to the members the

power of making gold, and of keeping death at a distance. The most eminent persons of the French court were his disciples; above all, Cardinal Rohan. Cagliostro became implicated in the diamond necklace scandal, by the evidence of the countess de la Motte, and was taken to the Bastille; but as nothing could be proved against him, his liberty was restored to him, but he was expelled from France, and removed to England, where, however, he never made much headway. Nothing would be more fatal to a person of his stamp than an encounter with English common sense. London was not the place for Cagliostro. His exclusion from Germany was caused by Elias von der Recke, his Mittau disciple, who had become his most decided denouncer in a book entitled *Nachricht von des berühmten Cagliostro Aufenthalte in Mittau* (Berlin, 1787). He betook himself to Switzerland and Sardinia, but his star was declining. On his arrival in Rome in 1787, and on attempting to found a new masonic lodge, he fell into the hands of the Inquisition, and was sentenced to death. This judgment was commuted to imprisonment for life, and he died after having had time for 8 years, in his drowsy dungeon, to ponder over the amazing facility with which, under certain circumstances, bad men may prey upon their fellows. His wife, who was kept in durance in a convent, died a few years afterward.—In Alexander Dumas' *Mémoires d'un médecin*, the *médecin* is Cagliostro in his original character of Dr. Joseph Balsamo. In Gasanova's "Memoirs," interesting reference is made to him. Mirabeau, in his letters dated 1786, speaks of Cagliostro, and, in the same breath, of Lavater, who, with all his knowledge of human nature, was one of the most eminent dupes of the Sicilian impostor. Memoirs of his life appeared in French and Italian. Thomas Carlyle, in his "French Revolution," also gives a description of Cagliostro in connection with the necklace affair.

CAGNOLA, LEOB, marquis, an Italian architect, born in Milan in 1763, died Aug. 14, 1833. Among his best works was a grand arch of wood, which he erected at Milan, and which was so greatly admired that it was ordered to be executed in some more durable material. The work was commenced, but the reverses and overthrow of Napoleon had nearly caused its total suspension, when the emperor Francis I. of Austria directed the arch to be completed. Another of his great works is the Porta di Murago at Milan. He also constructed several churches at Milan and other cities, the finest of which is one in the Corinthian style at Ghisallo. Some of his designs, however, were on so magnificent a scale as to render the execution of them hopeless.

CAGNOLI, ALESSIO, an Italian mathematician, born at Zante in 1748, died in Verona, Aug. 5, 1816. The son of a functionary of the republic of Venice, he spent some time as secretary of legation at Madrid, and subsequently came to Paris, where he devoted himself to the

study of astronomy. Afterward he lived at Verona, where his house became a sort of observatory, until 1797, when the French invasion made him leave the city. He taught astronomy at Modena for a time, and finally returned to Verona. He was the author of a work on astronomy, and of another on trigonometry.

CAHAWBA, a river of Alabama, rises in Jefferson co., and after passing through a rich coal region, joins the Alabama at Cahawba, in Dallas co. It is navigable by small boats for 100 miles.—CAHAWBA village, Alabama, is the capital of Dallas co. It is situated on the Alabama river, near the mouth of the Cahawba, contains several churches, printing offices, and a land office, and is the shipping point for the cotton produced in the neighborhood.

CAHEN, SAMUEL, a French Hebraist, born at Metz, Aug. 4, 1796. He received a good education, which he improved by assiduous industry in after life. Intended by his parents for a rabbi, he was, at the age of 14, sent to Mentz to enjoy the instructions of the rabbi of that city. He edited the *Archives Israélites*, completed a translation of the Bible in 1851, and has published many works intended to illustrate the Hebrew language.

CAHORS, the chief town of the department of Lot, France, on the right bank of the river of that name, which forms here a wide bend so as to enclose the town on 8 sides, 60 miles N. of Toulouse. Its narrow and crooked streets, as well as various remains, are evidence of its antiquity. Vestiges of a Roman amphitheatre, aqueduct, and portico, are still to be seen here. Of the 8 bridges on the Lot, one, probably built in the 14th century, is surmounted by 8 towers, to defend the approach to the town. The capture of Cahors in 1580 was one of the most brilliant exploits of Henri IV., then king of Navarre; after surprising one of the gates, he had to fight for 5 days and nights in succession before gaining full possession of it. Cahors is the seat of a bishopric, the occupant of which during the middle ages held the title of count, and wore a sword and gauntlets, which he deposited on the altar when he said mass. The cathedral of Cahors is a fine edifice. Among the public institutions are a theological seminary, a public library, a lyceum, an agricultural society, &c. Clément Marot, the poet, and Murat, king of Naples, were born here. The university, which was founded in the 14th century, but suppressed after the revolution of 1789, had the famous jurist Cujas as one of its professors, and among its pupils was Fénélon, whose statue is placed in front of the college on the Fossé promenade. In the middle ages Cahors was one of the most important emporiums of the money-changers of southern France, who were called *Caorsini*. There are some manufactures of cloth and other woollen stuffs; a considerable trade in wines, leaf tobacco, brandies, and truffles is carried on. Pop. in 1856, 13,676.

CAIAPHAS, the high priest of the Jews, to

whom Jesus was sent by Annas, before whom he was first brought in his betrayal by Judas. The mention of Annas and Caiaphas as both holding the office of high priest at the time of the trial of Jesus, has given some difficulty to Biblical readers, who know that, according to the Mosaic system, there could be but one high priest at a time. But it must be remembered that the Jewish people were in a state of subjection to the Roman power, and held their religious forms not in the integrity of the Mosaic statutes, but arbitrarily modified at the pleasure of the Roman governor of Judea, at least since the accession of Herod. This arbitrary power was exercised by the successive Roman governors so freely as to change the high priest's office from hand to hand almost yearly. But as, according to Jewish notions, the sacredness of the high priest was not so readily transmissible from one person to another, he who had once held the office of high priest was ever after spoken of with the same reverence as though he had not been divested of this dignity. Hence, when out of regard to his age, and also his relationship as father-in-law of Caiaphas, Jesus was first brought to Annas, he sends him in turn, as arrested on a civil criminal charge, to Caiaphas, the only high priest who had any jurisdiction in the case. Caiaphas was the immediate successor of Simon, the son of Camith, and came to the pontifical honors about A. D. 27 or 28, from which he was deposed after 9 years, and succeeded by Jonathan.

CAICOS, or CAYCOS, or THE KEYS, 4 of the Bahama islands, called Great, Little, and North Keys, and Providence Island, on a bank of the Atlantic. Some islets and rocks are generally included with them under the name of Caicos. The Great Key is 80 miles long.

CAILLE, NICOLAS LOUIS DE LA. See LA CAILLE.

CAILLÉ, RENÉ, a French traveller, born Sept. 19, 1799, at Mauzé, died near Paris, May 17, 1838. His imagination became fired by reading the adventures of Robinson Crusoe, and his attention turned to the exploration of Africa. At the age of 16 he embarked for Senegal. After having passed some time at Guadeloupe, he returned in 1818 to St. Louis and joined the caravan which Partarrieu conducted through Gjolof and Foota to Bondoo, where he joined Major Gray, the leader of the English exploring expedition, who was detained at the latter place. This expedition, however, did not prove successful, and Caillé, after recruiting his strength in France, returned in 1824 to Senegal, determined to reach Timbuctoo by his own exertions. Baron Roger, the French governor of Senegal, helped him to a small supply of merchandise, and Caillé, having adopted the Arabian dress and assumed the religion of the country, joined a caravan as peddler of goods. After many vicissitudes and adventures, he set out from Kakoudy, April 19, 1827, and following a south-eastern direction he passed Inanke, Foutah-Gjalo, Baleyá,

Arrens, and June 16, reached for the first time the shores of the Niger, which he crossed. After spending some time at Kankana and Sambakilla, he travelled about 200 miles eastwardly over territories never visited before, arriving at Timé Aug. 9. Here he was detained by illness for 5 months, until Jan. 9, 1823, when he struck on a new road which had previously been unknown to geographers, and following a N. N. E. course, he reached Jenne on March 11. Here he embarked for Timbuctoo, where he arrived about April 11, after one month's sail on the Niger. He fell in there with a caravan bound to Morocco, and in order not to lose such an auspicious opportunity for returning, he left Timbuctoo after a short stay of a fortnight, and after a tedious and painful passage of 2 months through the desert, he reached Fes, Aug. 13, and from thence travelled to Babath, then to Fuzzen, and from the latter place he returned to France. On his arrival at Toulon he was received with the utmost enthusiasm. He was the first European who ever returned from Timbuctoo, and who had achieved success, while expeditions supported by government had resulted in failure. A special prize of 10,000 francs was awarded to him by the geographical society, with the annual price of 1,000 francs for the most important discovery. The order of the legion of honor was conferred upon him by the king, and he became, at the same time, the recipient of a salary in connection with an office, to which he was appointed in the Senegal service. Furthermore, a pension from the fund set apart for eminent literary and scientific men was decreed to him by the minister of the interior, and his *Journal d'un voyage à Timbuctoo et Jenne, dans l'Afrique centrale, etc.*, with geographical data aided by Jomard, was published at the expense of government, and appeared at the beginning of 1830 in 3 vols. 8vo.

GAILLET, GUILLAUME, called Jacques BOSTUME (a surnique given by the nobles to the peasants who meekly submitted to their ill-treatment), the leader of the French peasants, or *Jacquerie*, as they were called, who in 1358 rose against the nobility of northern France, was born at Mallo near Beauvais. From Beauvais and Clermont, the insurrection spread over the neighboring districts; nearly 100,000 peasants were in arms, and in the course of their murderous attacks, to which they were chiefly incited by their starving condition and by the extortion practised upon them by the nobles, they destroyed more than 160 fortresses in Valois and the dioceses of Laon and Soissons, and the castles of the family of Montmorency. When the nobles of all parties had combined to smother the rebellion, Gaillet presented himself to the king of Navarre, Charles the Bad, with a view of entering into negotiations. The king, however, sentenced him to die on the gallows.

GAILLIARDI, FULVINO, a French traveller, born at Nantes, March 10, 1787, visited in his youth Holland, Italy, Greece, and Turkey.

On arriving in 1818 in Egypt, he was sent by the pasha on an exploring tour along the shores of the Nile, and the neighboring desert. From that time, M. Gallaud devoted himself to the exploration of Egypt, and the results of his investigations were published in 1821, in the description of his travels to the desert of Thebes; in 1826 and 1827, of his journey to Meroë; and in 1831, in a work on the artistic, industrial, and domestic life of the ancient Egyptians, Nubians, and Ethiopians, with details on the aspects of their modern civilization. Gallaud's most interesting discoveries consisted in the famous emerald mines on Mount Zabarah, and in the ruins of a small town, probably formerly the place of abode of the miners, with Græco-Egyptian monuments and very ancient inscriptions. He also discovered one of the ancient roads of traffic which connected India with Egypt. On his return to Paris, his collection of antiquities and his other trophies were purchased by the government, and M. Jomard was charged with the publication of the work on Thebes, and subsequently with that on Syouah.

CAILLOMA, or CAILLOMA, a town of Peru, South America. It is the capital of a province of the same name, in the department of Arequipa. Pop. of the province in 1850, 25,445.

CAILLOU LAKE lies in Terre Bonne parish, Louisiana. It is 10 miles long, and connected with Caillon Bayou, and with the gulf of Mexico, 2 miles distant.

CAIMACAN (Turk. *Kaisantaw*), an oriental title, applied to the grand seignor, the grand vizier, the governor of Constantinople, and the commandants of the Turkish provinces; and, among the Tartars of the Crimea, to the regent in the absence of the khan.

CAIN, eldest son of Adam and Eva, became a cultivator of the soil, killed his brother Abel, who was a keeper of flocks, and was condemned by God to be a fugitive and vagabond on the earth. After many wanderings, he retired to the land of Nod, on the east of Eden, where he built a city, which he called Enoch, from the name of his son.

CAINITES, a sect of the 3d century, who paid homage to all the reprobate characters mentioned in sacred history. Cain, from whom they took their name, and Judas, the traitor, of whom they had a forged gospel, were objects of their particular veneration. They were a branch of the Gnostics, and admitted great numbers and various ranks of good and virtues.

ÇA IRA, a revolutionary song in France during the reign of terror. Originally the music was adapted to a favorite air of Marie Antoinette, who was doomed to hear it again on her way to the guillotine. For 4 years the bloody air accompanied the victims of the first revolution to the guillotine. It was only totally abolished when Napoleon, on entering upon the consulate, prohibited all songs which savored of the reign of terror. Yet, like the *Marseillaise*, the *Carmagnole*, and the *Chant de départ*, the *Ça ira*

has become naturalized among the French national songs, and even during the outbreaks in France after the revolution of 1848, the ominous song was occasionally heard again in the streets of Paris.

CAIRD, JAMES, a Scotch agriculturist, born at Stranraer in 1816. He was educated in Edinburgh, became tenant-farmer on the estate of the earl of Galloway, in Baldoon, was brought into public notice as agricultural commissioner for the "Times" newspaper, and has published several works on agriculture, the most important of which are "High Farming" and "English Agriculture." In 1857 he was elected to parliament for the borough of Dartmouth, as a supporter of Lord Palmerston.

CAIRD, JOHN, a clergyman of the church of Scotland, born at Greenock in 1823. He was educated at the university of Glasgow, licensed to preach in 1844, and became soon after minister of a church in Edinburgh. He exchanged this position in 1850 for a rural pastorate in Errol. In the church of Orathy, Oct. 4, 1855, he preached in presence of the queen and Prince Albert, and the sermon, published by royal command, and entitled "Religion in Common Life," attracted much attention, and was republished and widely read in America and on the continent of Europe. Mr. Caird is one of the most eloquent preachers in Great Britain, and his manner is described as a gradual transition from simple earnestness to the most violent yet skillful gesticulation and vociferation. He is now one of the ministers of Glasgow, and published in 1858 a volume of sermons.

CAIRIRIS, or JABITACA, a mountain range of Brazil, in the province of Pernambuco. It is 800 mile long, and forms the northern boundary of the basin of the Rio San Francisco.

CAIRN (Welsh, *carne*), the name of ancient heaps of stones in a conical form, which were erected in Britain as sepulchral monuments in honor of great men. The stone chests containing the urns and ashes of the deceased rest below, and as many as 17 have been discovered under one cairn. The Scottish Celts have a saying, "I will add a stone to your cairn," which means, I will bless and honor your memory. In many parts of Scotland and Ireland, a heap of stones in the form of a cairn is gradually raised on the spot where a murder has been committed. The country-people think it unlucky to pass by without throwing a stone on the heap.

CAIRNGORM, a mountain of Scotland, in the counties of Banff and Moray. It is 4,095 feet above the sea, and during most of the year its summit is covered with snow. Among other minerals, it produces the topazes known as "Cairngorm stones."

CAIRO, a town of Alexander co., Illinois, built on a low point of land, at the junction of the Ohio and Mississippi rivers. It was founded with the expectation that it would shortly become a great commercial city for the south-

ern part of the state, and large sums of money were expended on it in improvements by the Illinois central railroad company, who owned a great part of the land, and had here their workshops and the southern terminus of the road. To protect it from inundation, levees were erected, and a new embankment, 80 feet wide, 10 feet high, and designed to encompass the city, was commenced about 1857. In the summer of 1858, however, a destructive flood rose above this work, and destroyed almost the entire town. In 1857 Cairo had 8 mills, 1 iron foundry, 2 banking-houses, 2 insurance agencies, 8 newspaper offices, 1 brick-yard, 2 railroad depots, 2 telegraph offices, 8 hotels, 5 churches, and about 470 houses.

CAIRO (anc. *Corium*), a town of Piedmont, in the division of Genoa, on the Bormida, 12 miles N. W. of Savona, and 5 miles S. of Dego. Pop. 3,492. The French defeated the Austrians near here in 1794.

CAIRO, the capital of Egypt, the most populous city of Africa, and, after Constantinople, of the whole Turkish empire, is situated about a mile from the bank of the Nile, and 12 miles above the apex of the delta of that river; lat. 30° 2' N., long. 31° 16' E. It lies mostly on the level plain of the Nile valley, but the south-eastern part, including the citadel, is built upon a spur of the Mokkatam mountains. Cairo occupies a site of about 7 miles in circumference, and presents from without an enchanting spectacle, but within the appearance is far from being attractive. There are about 80,000 houses in Cairo. Those of the poor are built of mud, or of sun-baked bricks, and are only one story in height. Those of the richer class are built of brick, wood, and of a soft stone quarried in the neighboring Mokkatam mountains, and are 2, and frequently 3 stories high. The streets are in a wretched condition, unpaved and dusty. The usual mode of conveyance is by donkeys, horses being rarely employed, and the use of carriages being impossible, except in a very few streets. The principal public place, called the Esbekeejah, is planted with shrubs and trees, and crossed by walks. There are about 70 baths, which are more cleanly than in other eastern cities. There are also many caravansaries, or inns, and numerous large and neat store-houses; and the extensive bazaars, though deprived of that magnificence which they exhibited at the beginning of the 15th century, still present a goodly array of the merchandise of the East. There are many public fountains, often elaborately ornamented with arabesque work, and a great number of coffee-houses, some of which are highly interesting during the fast of Ramadan, when the performances of the Karagioos, or Turkish Punch, take place. But the boast of Cairo is its mosques, of which there are said to be as many as 400, some of them elegant specimens of Arabian architecture. The most celebrated is the mosque of Sultan Hassan, which has a magnificent entrance, beauti-

fully embellished with honeycomb tracery. Attached to another mosque is a famous hospital for insane and other helpless persons, who are gratuitously supported in great numbers. The mosque El Asbar is celebrated not only for the beauty of its architecture, but for containing a college, to which many hundreds of students resort from all parts of the Mohammedan world, and which is the great centre of the study of Arabian literature. The mosque of Ibnoum, founded A. D. 879, is interesting, as exhibiting specimens of the pointed arch, which was afterward introduced into Europe, and is one of the distinguishing characteristics of the Gothic style of architecture. North-east of the city, just outside of the walls, are a number of very beautiful mosques, built over the tombs of the Circassian and Borgite Mamelukes. In the south-western part of the town is the citadel, a fortress on a hill, 200 feet above the rest of the city, containing the palace of the viceroys, the mint, a manufactory of arms, various government offices, barracks, and other buildings, and a splendid mosque, begun by Mahomet Ali, and lately finished. Within the citadel is a deep well cut through the rock, which, though solid, is not hard, to the depth of 250 feet. It consists of 2 portions, the upper part being an oblong square, 34 feet by 18, and 153 feet deep, and the lower having a similar shape, 51 feet by 9, and 125 feet deep. The water is raised from the lower well into a basin at the bottom of the upper, whence it is conveyed to the citadel above, and is commonly designated Joseph's well, after Saladin, who is said to have constructed it, and who was also called Joseph. The citadel, which affords a splendid view of the city, of the Nile, and of the pyramids, commands the city, but is itself commanded by a neighboring ridge of the Mokattam mountains, and is, therefore, of no utility against an attack from without.—The different races who inhabit Cairo live in distinct quarters, of which there are many, as the Jews' quarter, the Frank quarter, the Coptic quarter, &c. The streets leading to each quarter are closed at night by gates, of which there are 71. Cairo is divided, for purposes of police regulation, into 8 wards, each of which has a separate presiding officer, while the whole are under the superintendance of one common chief. Each trade, or calling, has also its sheik or head, who is in some measure responsible for the conduct of the members of his guild. Justice is administered in a summary manner; and breaches of the public peace are said to be less common than in some European cities. In the Frank quarter is a theatre, supported by subscription among the Europeans, the troupe being composed of dilettanti, with the exception of the manager, who is an actor by profession. In the same quarter are the library of the Egyptian society, and the Egyptian literary association. Ibrahim Pasha's library comprised the works of the most noted Arabic and Turkish authors. The same prince be-

gan a collection of Egyptian antiquities, and there is also a similar collection belonging to Mahomet Ali. The medical academy, established in 1837 by Mahomet Ali in the hospital of Abouzebel, was afterward transferred to Cairo, but, being unfavorably affected by the reverses of 1840, did not give many signs of vitality until 1856, when it was reestablished on a larger and improved scale in a charming locality on the shores of the Nile, within a short distance of Cairo. The academy, which was inaugurated on Sept. 10 of that year, is intended to contain different hospitals, botanical gardens, a library, cabinet, and museum of chemistry and natural history, and to teach all the branches of the medical and natural sciences, and is under the charge of Dr. Clin-Bey. An academy, chiefly designed for the military profession, but embracing the general branches of European education, was opened in 1852, by Solyman Pasha, received the sanction of the government in 1858, will admit 200 pupils, and is presided in the direction of an accomplished Egyptian poet and scholar Rifah Bey. Among the charitable institutions of Cairo must be mentioned the private school for young orphan girls, kept by the sisters of the "Good Shepherd." There are about 60 girls in the institution, all natives of Egypt, but comprising Christians, Mussulmans, and Jews, without distinction of creed. A free pharmacy has also been opened by a company of sisters of charity, where the poor sick are supplied with medicine. In 1857 an annual grant of breadstuffs was conferred by the viceroys upon the former, and an annual contribution of \$1,000 upon the latter institution.—Cairo has 2 suburbs, Boudak, and Maser-el-Aatik, old Musr, or capital, to distinguish it from Cairo, which is now the sewer. This latter suburb is also called Fostat, and by Europeans commonly, but improperly, Old Cairo. Both these suburbs are on the bank of the Nile, and serve as parts to the city. Fostat contains some ancient buildings, called the "granary of Joseph," still used for the storage of grain. On the island of Rodah, near the town, is the celebrated Nilometer, a rude, graduated column, many hundred years old, for indicating the height of the Nile during the annual inundation. From Fostat a canal of irrigation runs through Cairo, and is continued some miles beyond. It is supposed by some to form part of an ancient canal connecting the Nile with the Red sea. From this place also an aqueduct, nearly 2 miles long and supported by about 800 arches, built by the Arabs, conveys water to the citadel—that procured from the well above mentioned being brackish, and not used for drinking. Cairo is surrounded by walls, which are pierced by several gates, some of them of considerable beauty. In its environs are immense piles of rubbish, forming small hills. The climate is warm, but considered healthy, though, owing to the filthy condition of the city, and its inhabitants, the mortality is large.

Ophthalmia is very prevalent, and the plague occasionally makes terrible ravages among the population. The manufactures embrace silk and cotton fabrics, gunpowder, glass lamps, sugar, sal ammoniac, leather, weapons, and iron ware. Cairo is a central station of the overland route to India, and its commerce is considerable. The slave market is no longer held in the city. The black slaves are kept outside of the town, and the Circassian, Greek, Georgian, and other slaves, are kept in the private houses of the dealers. One of the most lucrative trades of Cairo is that in precious stones and jewelry. The remarkable resources of Cairo make it a favorite resort of Italian, Greek, French, Armenian, and other commercial adventurers, and of intriguers of all nations, who are constantly found hovering round the court of the viceroy, busy in scheming and in endeavoring to secure some profitable job. A railroad connects it with Alexandria, and caravans annually arrive from Darfoor, Sennaar, and Moorzook. Every year an immense caravan assembles in the neighborhood of Cairo to make the pilgrimage to Mecca, and as the pilgrims generally carry some goods with them for traffic, their departure and return is to Cairo a considerable source of wealth. Mehemet Ali established a number of schools after the European fashion, but his plan met with much opposition, and had but indifferent success. The Greeks have 2 churches in Cairo, the Armenians 1, the Copts about 12, and the Jews some 40 synagogues.—The city is said to have been founded about A. D. 970, by Moaz, an Arabian caliph from western Africa, who gave it the name of *El Kahireh*, or the victorious, in commemoration of his conquest of Egypt. This prince made Fostat his capital, but in the 12th century the seat of government was removed to Cairo, which henceforth became the *musr* or capital, while Fostat was called the old capital, Musr-el-Aatik. At the beginning of the 15th century Cairo was one of the most flourishing cities in the world, the centre of commerce between Europe and India, and the entrepot of the trade of Africa. In 1754 it suffered severely from an earthquake; in 1798 it was taken by the French, who were however expelled by the English in 1801, and the city has since been a dependency of Turkey, under the rule of the viceroy of Egypt. The population has usually been greatly overestimated, and probably does not exceed 200,000, of which there are over 120,000 Mohammedans, 60,000 Copts, and many Jews, Franks, Greeks, and Armenians.

CAISSON, a French contrivance formerly much used in obtaining foundations for piers. Originally it was a roughly made strong basket, filled with stones, and sunk to the bottom. Afterward strong boxes of plank, well secured with iron bands, were used for this purpose. In them the stones were regularly laid in masonry, and the whole sunk together to the bottom. The foundations of Westminster and Blackfriar's

bridges were thus prepared; and the French engineers, with whom this was a favorite method, introduced the same upon a gigantic scale in the construction of the breakwater at Cherbourg. (See BREAKWATER.) On our northern rivers it is sometimes used by building up an enclosure of logs on the ice in the winter, and filling this with stones, till the whole breaks through and sinks to the bottom.—The French have various applications for the word in the military art, all of which depend upon its signification of box or chest.—In architecture, it is a sunken panel in a flat or vaulted ceiling, or in the soffit of a cornice.

CAISTOR, or CASTOR, a market town and parish of Lincolnshire, England. It has an ancient church which stands on the site of Thongceaster, a Roman station said to have been rebuilt by Hengist on as much land as an ox-hide cut into thongs would cover. The grammar-school here was founded in 1630. The manufacture of chairs of elm and ash is actively carried on. Pop. in 1851, 2,407.

CAITHNESS, the most northern county of Scotland, containing an area of 618 sq. m.; pop. 38,709. Dunnet Head, the most northerly point of Great Britain, is in Caithness. The surface of the county is flat. It is generally moorland, and but a small part is under cultivation. The climate is wet and severe, not from the intense cold, but from storms and general inclemency. The inhabitants are chiefly engaged in the fisheries alternated with agricultural pursuits, which are much encouraged by the chief landowners. The general state of the county is very primitive, population being scanty and the means of communication limited. Gaelic is still much spoken. This remote district was formerly the chief commercial outlet of Scotland, from which an active trade was carried on with northern Europe. The Caithness weights and measures were from this circumstance made the Scottish standard by David II. The harbor of Wick, the principal town, is commodious, and has been greatly improved by the expenditure of a considerable sum of money. The county gives the title of earl to the Sinclair family, and returns one member to the house of commons.

CAIUS. I. A Roman general, son of Marcus Agrippa and Julia, the daughter of Augustus Cæsar, who lived in the first century before our era. He was adopted by Augustus, served under Tiberius in Germany, and was sent as proconsul against the Arabians, Armenians, and Parthians. He reduced Armenia and routed Tigranes. He was treacherously wounded at a private interview with an enemy, and sank early and much regretted under the effects. II. A Christian theologian and bishop of the 3d century. His origin is uncertain, but he was a disciple of St. Irenæus. He had a conference with Proclus, the leader of the Montanists, and in 210 was appointed a bishop with the commission of preaching to the heathen in foreign parts. He regarded the epistle of St. Paul to the Hebrews as apocryphal, and was the first who wrote

against Cerinthians and the Millenarians. His last work was one aimed at those who asserted that Jesus Christ was only a man. III. CATES, fr., bishop of Venna, died April 21, 266. He was a native of Dalmatia, and nephew of the emperor Diocletian. He succeeded Eulycianus Dec. 16, 265. At the time of the first persecution of the Christians by Diocletian, he was forced to find safety in an obscure retreat.

CAIUS, JAMES, the founder of Caius college, Cambridge university, born at Norwich, Oct. 6, 1510, died in Cambridge, July 30, 1573. His name was Kaye or Key, which he Latinized into Caius. He took his degrees at Gorrville hall, Cambridge, and was chosen fellow of his college. While at Cambridge he distinguished himself by various translations from the classics. He spent some time in travelling on the continent, studied medicine at Padua, under Montanus and Vesalius, and took his doctor's degree at Bologna (1541). In 1542 he lectured at Padua on the Greek text of Aristotle, and in the following year made a tour through Italy, visiting the principal libraries, in order to compare the MSS. of Galen and Celus. He returned to his native country in 1544, and practised, first at Cambridge, then at Shrewsbury, and afterward at Norwich. He was appointed by Henry VIII. lecturer on anatomy to the company of surgeons, London. In 1547 he became fellow of the college of physicians, and was appointed court physician to the young king Edward VI., which appointment he retained under Queens Mary and Elizabeth. In the reign of the latter, an exciting controversy arose between the surgeons and physicians of London, as to the right of the former to administer internal remedies for the solution. Dr. Caius argued the negative on silly on behalf of the physicians, that, although the surgeons' case was supported by the bishop of London and the master of the rolls, the decision was against the right of the surgeons to continue the practice of administering medicines. Dr. Caius was elected president of the college of physicians for 7 years in succession. There is extant a book of the college annals from 1555 to 1573 written by him in Latin, which is the earliest account we have of the transactions of that college. He was dismissed from the royal service in 1568 on suspicion of favoring the Catholic party. He obtained permission to endow and raise Gorrville hall into a college, which still bears his name, and accepted the mastership thereof. The last days of his life were passed in the seclusion of his college. His works are numerous, on various subjects; many of them have been reprinted in modern times.

CAJANO, a village of Tuscany, in the Val Ombrone. It has a handsome villa, belonging to the grand duke, and an iron suspension bridge over the river. The celebrated Bianca Capello died here in 1587.

CAJEPUT OIL, a volatile oil, distilled from the leaves of a small myrtaceous tree or shrub, found alone in the island of Honee in the

Malay archipelago, a species of *melaleuca*, named the *cajepout*, though possibly it is the *M. minor* of De Candolle. The name is a corruption of the Malay designation of the oil; *malagaj bayu-pouti*, "white wood oil;" the latter words being written by the Dutch, *agay-nutti*; and hence the English corruption, *cajepout*. The whiteness of the bark of the tree, is the cause of the name given to the oil. It is in high repute, not only as a liniment, but as an internal remedy among the different peoples of the archipelago, especially the Javanese. A few Chinese and Javanese traders of Batavia, are the sole factors of the trade in *cajepout*. The leaves are gathered on a dry hot day, and being steeped in water they commence fermenting, and are then distilled. The quantity of oil obtained is small, and it being extensively used by the Malays, the price it commands is very high. It is imported in glass bottles, and as received it is commonly of a fine green color, which has been attributed to the copper vessels, in which it was prepared. Copper has indeed been detected in some samples of it; but not always being found, the color is supposed by some to be the natural color of the oil, derived from the greenish principle or chlorophyll of the leaves. Whatever may be the cause, the odor disappears by rectifying the oil. This is then a very thin fluid, transparent, of a warm, pungent taste and odor like that of camphor and turpentine mixed. It is soluble in alcohol, but only partially so in water; burns readily without residue, and is of specific gravity 0.914 to 0.927. It is often adulterated with oil of turpentine and camphor, or oil of rosemary. It is used in medicine for its highly stimulant quality, either as an external application mixed with the same quantity of olive oil for gouty and rheumatic pains, or taken internally in cases of chronic rheumatism, and spasmodic affections of the bowels. Some have highly recommended its use in cholera. It is introduced into the cavities of aching teeth, to relieve the pain.

CAJETAN, or CAJETANO (TOMMASO DE VIO), an Italian cardinal, born July 25, 1470, at Gseta, died in Rome, Aug. 9, 1534. He entered the order of Dominican friars, graduated as a doctor, and was elected general of his order in 1508. When Pope Julius II. was summoned to appear before the council of cardinals assembled at Pisa and afterward at Milan, in the interest of King Louis XII. of France, Cajetan undertook his defence, asserting that to the pope alone belonged the power of convening a council. He was appointed cardinal in 1517 by Leo X., and sent as a legate in Germany to bring the emperor Maximilian and the king of Denmark into the league formed against the Turks. His efforts to make Luther recant his doctrines proved in vain. In 1519 he was present, as Roman legate, at the assembly of the electors of the empire, and sided with the partisans of Don Carlos of Spain, who was elected emperor under the name of Charles V. Then he returned to Rome; but was soon ordered by Adrian

VI. to Hungary, which was invaded by the Turks. In 1524 he was recalled to Rome by Clement VII. On the capture of Rome in 1527, being taken prisoner by the imperial troops, under the command of the constable of Bourbon, he had to pay 5,000 crowns as a ransom for his liberty, which sum he was obliged to borrow from his friends.

CALABAR, New, the name of a river and town in Africa, lying about 80 miles west of Old Calabar. The river is one of the mouths of the Niger, at 20 miles from the sea is 6 fathoms deep, and enters the bight of Biafra by the same estuary as the Bonny. The town stands on an island in the river about 25 miles from the sea, and contains upward of 300 houses. Its trade consists in slaves, ivory, and palm oil, for which European goods are received in exchange.

CALABAR, Old, a country of Guinea in West Africa, on the Old Calabar frith, in the bight of Biafra, at about lat. 5° N. and long. 8° E. It is traversed by the Old Calabar and Cross rivers, and has about 70,000 inhabitants, two-thirds of whom are slaves. Its principal towns are Duke Town and Creek Town, the former with a population of 7,000, the latter of 6,000. The chiefs and freemen are engaged in the palm-oil trade with British merchants. They bring the oil from the interior, and receive in return for it English wares and manufactures. Several missions have been established in the country, which have met with encouraging success.

CALABASH TREE, (*crescentia cujete*), is a native of the West Indies and the continent of America. It grows to about the height and bulk of an apple tree, with crooked horizontal branches. It has wedge-shaped leaves, pale white flowers from the trunk and branches, and a roundish fruit, from a few inches to a foot in diameter. The calabash fruit contains a pale yellow, juicy pulp, of an unpleasant taste, which is deemed a valuable remedy in several disorders, both internal and external. The uses to which the fruit of the calabash tree is applied are very numerous. It is covered with a greenish-yellow skin, enclosing a thin, hard, and almost woody shell, which is employed in lieu of various kinds of domestic utensils, such as bowls, cups, and goblets of every description. These shells are so hard and close-grained that, when filled with any fluid, they may sometimes be put on the fire and used as kettles without injury. They are also cut and carved, variously stained, and polished, as ornamental vessels.

CALABOZO, a town in the province of Caracas, Venezuela. It was formerly a mere Indian village, but has now about 5,000 inhabitants, most of whom own large herds of cattle.

CALABRIA, the southern part of the kingdom of Naples and of the Italian peninsula, lying between the parallels of 22° 48' and 32° N. lat., and having an area of over 6,000 sq. m.; total pop. in 1856, 1,187,782, comprised in 3 provinces: Calabria Citra, 456,018; Calabria

Ultra II., 398,584; Calabria Ultra I. 388,160. The Apennines reach through the whole length of Calabria, forming a large irregular ridge in the centre, with branches toward the sea in either direction. Between these mountain branches are numerous valleys, and near the shore extensive plains, where the vine, the mulberry, and the olive, the orange, lemon, and fig trees grow luxuriantly. Some of the mountains produce the manna ash, from which by an incision into its bark manna is abundantly gathered. Many of the northern valleys are used for pasturage; and the principal wealth of some of the districts is invested in flocks of sheep. Silk has been for several centuries the principal article of manufacture; but the increased tax which has been set upon it has diminished its amount of late. Calabrian white and red wines are noted for their excellent taste. The natives of Calabria are a hardy and enduring race of men; of a passionate disposition, and much addicted to playing cards. Numerous bands of gypsies, and a distinct sallow and muscular race of Arnauts, also subsist in the country. Calabria is subject both to earthquakes and inundations. In the middle of the 12th century Calabria reverted to Roger II., king of Naples and Sicily, and has since remained under the sway of that monarchy, the presumptive heir to the Neapolitan crown bearing the title of duke of Calabria.

CALAHORRA, a town of Spain, in Old Castile, in the province of Logroño, on the river Cidacos near its junction with the Ebro. It is old and decayed in appearance, and its houses are generally mean; its cathedral, in the mixed Gothic style, and an episcopal palace, are alone worthy of note. Calahorra is the ancient Calagurris, and is memorable as the birthplace of Quintilian, and for its desperate but unsuccessful resistance to a siege in the year 72 B. C. The remains of Roman towers and an aqueduct may still be traced. The celebrated warm baths of Amedillo are within a short distance of Calahorra. Pop. in 1852, 5,990.

CALAIS, a city of Washington co., Me., at the head of the tide on the St. Croix, 80 miles from the sea, at the easternmost extremity of the state, and opposite the English town of St. Stephen, the river St. Croix forming part of the boundary between the United States and the British possessions on our north-eastern frontier; lat. 45° N., long. 67° W.; pop. in 1855, 6,119. It was incorporated under a town government in June, 1809, and erected into a city in 1850. It is a place of large trade in lumber, which is manufactured from the extensive forests upon the upper waters of the St. Croix. Ship-building is also a growing branch of its trade. The tide rises here from 20 to 28 feet. Its lumber is sent to the ports of Great Britain, the West India islands, and to the coastwise ports of the U. S., going south as far as the Potomac. The arrivals of vessels in 1857 numbered 521, and the departures 522. The exports of sawed lumber from the river in that year were 65,000,000

feet, of which about 20,000,000 want to foreign ports. The other exports were 65,000,000 laths, 17,000,000 shingles, 5,000,000 pickets, 50,000 clapboards, 5,000 sugar boxes, 4,000 hachmatar ship-knees, and 1,400 cords of wood and bark. The machinery for sawing lumber is propelled exclusively by water power, and consists of 60 mills, and 40 lath and shingle machines. Thirty-six of the mills contain "gangs" of saws, each gang consisting of 16 movable upright saws in a single frame, 26 mills run single saws, and 2 run circular saws, the whole having a capacity of production equal to 700,000 superficial feet of sawed lumber per day. The water power is of a superior character, the large lakes at the head of the river acting as reservoirs during the dry season, and preventing sudden rises by freshets; the maximum rise of the river from the lowest point of depression being less than 10 feet. A railroad conveys the lumber from the mills to the wharves, and extends 20 miles up the valley of the river. The turn reports annually about 100,000 bush. of corn, 20,000 bbls. of flour, and 2,000 bbls. of pork. It owns 8,000 tons of shipping in coasting vessels and steamers. It has a steam flour mill, an establishment for grinding and calcining plaster of Paris which turns out about 15,000 casks per annum, an iron foundry, a dry dock, several grist mills, and a number of small factories for various kinds of wood manufactures. Two steamboats ply upon the river, and a semi-weekly line of steamers runs in connection, to St. John on the east, and Portland and Boston on the west. A tri-weekly stage runs northerly to the interior 100 miles, connecting with the upper valley of the St. John river in the province of New Brunswick, and two daily stages run to the west. The city contains 8 churches, 16 school houses, 1 high school, and 1 academy. Education is gratuitous. The average annual attendance at the schools is 700. The amount of money raised by voluntary taxation in 1858 was \$16,000, or about 1 per cent. upon the full market value of the property assessed. It was for schools \$8,000, streets and highways \$2,000, poor \$2,000, city expenses \$2,500, interest, deficiencies, &c., \$3,500, state and county taxes \$3,000. Within the city limits, at the mouth of the river, lies St. Croix or Big Island, on which Pierre du Gast, Sieur de Monts, wintered in 1604-'5, on the voyage in which he founded Port Royal in Nova Scotia, the first permanent French settlement in America.

CALAIS, a seaport town of France, department of Pas de Calais, on the straits of Dover, 20 miles N. N. E. of Boulogne, 225 miles N. N. W. of Paris. It had once some pretension to antiquity, being regarded by the learned as the *Picta Riva*, whence Cæsar sailed for England; but it has been proved beyond doubt that this honor belonged to the little village of Wisant. Calais is not mentioned before the 11th century, when in 997 Baldwin IV., count of Flanders, improved the port, which was protected by the remains of 2 towers. In 1234, Philip of France, essent of Burgundy, built a wall around the

town and a castle at its entrance near the sea-shore. In 1347, Calais, after a siege which lasted no less than 31 months, was obliged to surrender to Edward III., and was saved from entire destruction by the heroic devotion of Eustace de St. Pierre and his 5 companions. The citizens were compelled to leave the town, and an English colony was established here. After being more than 900 years an English city, Calais was, in Jan. 1558, retaken by the celebrated Francis, duke of Guise. The Spaniards took possession of it in 1596, but had to surrender it on the peace of Vervins, 1598. It was vainly besieged by the Spanish army in 1657, and twice bombarded by the English during the reign of Louis XIV. In 1804, during the preparations at the camp of Boulogne, an English fleet attempted, but failed, to surprise it. The same year it was visited by Napoleon. On April 24, 1814, Louis XVIII. landed here, which event has been commemorated by the erection of a pillar. The town is now a fortress of the 2d class, surrounded by newly improved walls and bastions, and protected by a strong citadel commanding also the port. It is neatly built, with regularly laid-out streets and clean houses, so much so that, according to a traveller, it looks like the picture of a city. The ramparts, which are planted with trees, form an agreeable promenade. The gate on the road to Paris, constructed in 1685, is a fine piece of architecture. Very few monuments deserve to be mentioned, with perhaps the exception of the parish church, built by the English, which is a fine building with a lofty spire. Manufactures are unimportant, except those of tulle (hobbynet), which employ no less than 600 looms, each loom requiring the attendance of a number of workmen, beside 5,600 women and children for the preliminary preparations. This branch, as well as others, would have been still more prosperous, if not prevented by the war regulations governing the country in the neighborhood of a fortress. The principal trade of Calais consists in carriages, French wines, brandies, and eggs, exported to Great Britain, for which are received in return butter and leather from Ireland. Vessels are fitted out for the mackerel, herring, and cod fisheries. The coasting is more important than the foreign trade. At present the principal dependence of Calais is on the resort of travellers to and from England, which is somewhat diminished by the competition of Boulogne. It has daily communication by steamer with several English ports, and has had telegraphic communication by a cable across the channel since 1851. The port is of easy access, and can admit vessels of 400 or 500 tons, but is laid bare at ebb tide. The entrances in 1853 consisted of 1,504 foreign vessels, representing 178,575 tons; of 53 coasting vessels, tonnage, 5,197; and the clearances of 1,306 foreign vessels, tonnage 140,566; and of 44 in the coasting trade, tonnage 2,079. In 1867, the entrances and clearances of foreign vessels were collectively 2,408, tonnage 424,000. The town communicates by the Aa with the St. Quentin ca-

nal, and by a branch with the northern railroad, both which facilities have lately enhanced its inland trade. Daniel O'Connell was educated in the Jesuit college here for the priesthood. Pigault-Lebrun was born here, and Lady Hamilton, Nelson's Emma, died here in 1815. Pop. 11,000, comprising about 400 English.

CALAMANCO, a woollen stuff of a fine gloss, and chequered in the warp, the checks appearing on the right side. It is manufactured in England, and extensively in the Netherlands.

CALAMANDER WOOD, the hardest and most beautiful species of all the fancy woods imported from Ceylon. It is so hard that edge-tools cannot work it, and it has to be shaped by rasps and files. It exhibits great richness and variety of color, very different shades being closely intermixed, the prevailing one being a fine chocolate. It is so expensive that it is imported only occasionally.

CALAMBUCCO, a valuable timber tree, found alone in the northern provinces of the island of Luzon. For shipbuilding it is esteemed in the Philippines as superior to the live oak, or the teak. It resembles the latter when dressed, has the same dark unctuous appearance, and like it is never attacked by the omnivorous and terribly destructive white ant of the Malay archipelago. Several colonial ships built of this timber, 50 years ago, are reported to be still seaworthy. The experiments made at the arsenal of Manila upon calambuco wood exhibit great strength and elasticity. Beside ships, a great variety of agricultural, mechanical, and warlike instruments are made from this timber. This name is also given in the Malay archipelago, to a tree which produces an odoriferous wood, the *agila*, or eagle wood, and aloe wood of commerce. It is found chiefly in Siam, the Malay peninsula, and in the northern portion of Sumatra; but is also found in the Indian peninsula, where it is called *apharu*; and hence, it is sometimes named by the Malays, *kayugharu*. The perfumed wood is supposed to be a diseased tumor in the tree, arising from the wound of a timber worm. The thickened, resinous sap formed in these tumors, is used as an incense in all eastern countries. There is much discrepancy in the statements of East Indian naturalists, relative to the tree yielding the genuine *agila*; and this perfume and aloe wood have been supposed to be the products of different trees; but it is the heart of the *kayukalambak*, or calambuco tree, which produces the aloe wood, and in the bark the *agila* is formed. The *agila* does not yield its exciting aroma until it is burned; but the calambuco or aloe diffuses its fragrance when rubbed in the hands.

CALAME, ALEXANDRE, a living Swiss landscape painter, of Neufchâtel, who settled at an early age in Geneva, where he became the pupil of Diday, and whither he returned after having spent some time at Rome. He has produced pictures of the most prominent scenes of the Alps, and in his power to render their pictur-

esque majesty, he is hardly surpassed by any living painter.

CALAMIANES, the name of a group of islands, and province of the Philippine archipelago. The group consists of the large islands: Busnagan, Calamian, Linacapan, Coron, Dumaran, Iloe, Lutaya, Carandaga, and about 240 unimportant islands and islets. This group and the northern portion of the great island of Palawan, called Paragua, constitute the province, which is the poorest and least populous of the 35 divisions constituting the Spanish Philippines. Area about 2,800 sq. m.; pop. 17,820. The inhabitants of the group and of the Spanish portion of Palawan, are of the Bisaya race; and have been converted to Christianity by the Spanish missionaries. Since the conversion, the improvement in the condition of the Paraguans, especially, has been most notable; before this occurrence they lived in naked savagery, like the southern Palawans, who recognize the dominion of the piratical sultan of Sooloo; at the present day the Paraguans live in communities, in neat dwellings of their own construction; they manufacture their own clothing, and their agricultural and mechanical implements; they export ratans, bees' wax, and birds' nests; and contribute a substantial amount of revenue to the support of the beneficent government, which has done incomparably more to advance the welfare of its Indian subjects, than any other European government in the eastern hemisphere. The Calamianes group does not partake of the volcanic character of Luzon, and other great islands of the archipelago; it is much less productive, subject to a hot, humid, and insalubrious atmosphere, and the agricultural labors of the inhabitants are greatly thwarted by the destructive voracity of great numbers of wild hogs, porcupines, deer, squirrels, parrots, and other animals and birds. This superabundance of wild animal life prevails mostly in the islands Busnagan and Calamian. The inhabitants are oftentimes disposed to return to their former sylvan life, when subsistence was so easily procured by the chase; but their philanthropic Spanish pastors encourage and aid them in the construction of better defences for the preservations of the fruits of their agricultural labors, and impress upon them the advantages of systematic labor, and the comforts of civilization which spring from it.

CALAMINE. This name is given to 2 different ores of zinc, one of which is the silicate, and the other the carbonate. The most common ore worked for zinc is the anhydrous carbonate. It occurs crystallized in rhomboidal forms, of vitreous lustre, and a little pearly, of white, yellowish gray, or brown color, semi-transparent or opaque, in forms botryoidal, stalactitic, and reniform, and in crystalline incrustations. Its hardness is 5, its specific gravity 4 to 4.45. It contains oxide of zinc 64.81, and carbonic acid 35.19. It dissolves with effervescence in acids, and is also soluble in ammonia moderately heated. It occurs in thick beds and irregular

masses, among calcareous rocks of the secondary and metamorphic formations. It is rarely found unaltered with oxide of iron and the silicate of zinc. It is extensively worked for the production of zinc paint at Vieille Montagne, between Liège and Aix la Chapelle. In this country it is found associated with hematite iron ores, and also with the sulphuret of lead or galena. It is worked near Bethlehem, Lehigh co., Penn., and in the vicinity of Lancaster. It is described in Dana's "Mineralogy" by the name of smithsonite. The hydrous silicate of zinc, also called electro-calamine, often accompanies the anhydrous carbonate, and it is usually the two minerals mixed which are designated by the name of calamine. It occurs in forms similar to those of the carbonate, and in crystals derived from a rhombohedral prism. Its hardness is 4.5, or when crystallized, 6; its specific gravity from 3.16 to 3.43. It dissolves by the aid of heat in sulphuric or muriatic acid, and gelatinizes on cooling. It becomes strongly electric by heat, to which property it owes its name. Its composition is silica 25.1, oxide of zinc 67.4, and water 7.5.—In pharmacy, the term calamine is applied only to the native carbonate, which has always been employed in an impure state. It is often sold, too, in a spurious quality, consisting principally of sulphate of baryta and carbonate of lime, with mere traces of zinc. It is said that the miners in England recognize 2 kinds of calamine: one, which they call brass calamine, is sold to the makers of brass; and the other, baryta calamine, which is the amorphous sulphate of baryta, is sold to the druggists for native carbonate of zinc. In medical preparations calamine is heated to redness, and reduced to an impalpable powder. By this calcination it is converted into oxide of zinc, mixed with the impurities of the ore. In this state it is called prepared calamine. It is used as an external application only, sometimes in the form of ointment, but more commonly it is dusted upon ulcerated and excoriated parts, upon which it acts as a mild astringent and exsiccant. In consequence of the impurities of this article, carbonate of zinc, obtained by precipitation, is substituted for it in the "United States Pharmacopœia."

CALAMIS, statuary and emblem of Athens, was a contemporary of Phidias, and flourished between 467 and 429 B. C. Pity bestows the highest praises upon his horses. Among his most celebrated works were a statue in metal of Apollo Alexicacos, in Athens, in 429 B. C., and which has erroneously been supposed to be the Apollo Belvedere; a colossal statue of Apollo in bronze, 30 cubits in height, which was taken to Rome by Lucullus; and a Jupiter Ammon consecrated by Pindar at Thebes.

CALAMITE, an extinct species of fossil plants found abundantly in the strata of the coal formation, but entirely wanting above the secondary formation. They are large cylindrical stems, articulated at intervals like the reed, and sometimes 14 inches in diameter, so is seen in

a specimen at Leeds. They are generally converted into sandstone, shale, or fire-clay, whichever of these rocks it may be, in which they are found. They have usually been regarded as cryptogamous plants of the sporophyte family; but by the investigations of Brongniart, it appears that these obscure stems cannot belong to any tribe of flowerless plants, but are more nearly allied to the gymnospermous diacetyledons. But Professor Williamson, while he admits their remarkable affinities with this family, is of opinion that the arrangement of their tissues differs widely from that of all known forms of gymnosperms.

CALAMUS (Gr. κάλαμος). I. A sort of reed, which the ancients used as a pen for writing on parchment or papyrus. These which came from Egypt and Caidus were the most esteemed. When the calamus became blunt, it was sharpened with a knife. It was split into two nibs, like our modern pens. This instrument must not be confounded with the stilus, which was only used for writing on wax tablets. II. In the pastoral poets of antiquity, a pipe of reed, on which enamored shepherds would play; in construction probably resembling a modern fife or flageolet.

CALAMY, J. EDWARDS, an English Presbyterian divine, born in London in Feb. 1600, died at Eufield, Oct. 29, 1666. He was educated to his baccalaureate at Pembroke hall, Cambridge. But at that time the Arminian controversy ran high, and Pembroke was in the interest of the Arminian party. Young Calamy expressed himself with so much freedom in favor of the opposite faith that he was cut off from a fellowship. He was, however, by Dr. Felton, bishop of Ely, appointed to a vicarage, and at the death of his patron was appointed lecturer at Bury St. Edmund's. Meanwhile, he became more and more opposed to the high-church party. Finally, on the publication of the Scottish liturgy and the "Book of Sports," Calamy left the established church, and spoke and acted plainly as a non-conformist. By the earl of Essex he was presented with the living of Rochford, which position he was compelled to resign, on account of his health, soon after. He now removed to London, and was afterward chosen minister of St. Mary, Aldermanbury. He acted a prominent part as a non-conformist divine, though a moderate one, during the rest of his life. Although an opponent of episcopacy, his opinions of which he published in a treatise, he strenuously urged the propriety of good treatment to Charles, and was in favor of the restoration. When, therefore, it was decided to invite the exiled son to the throne of his father, Calamy was appointed as one of the commission for that purpose. Calamy had been an active member of the assembly of divines, appointed by the house of lords in 1641 to report a plan for the reconciliation of the ecclesiastical difficulties of the realm. This was a project congenial to his views and temper. So long, therefore, as there was any hope of ac-

completing it through the agencies and on the plan then suggested, he retained his position; but when the Savoy conference failed of any such result, he made one more unsuccessful attempt, and then, on the passage of the uniformity act (1662), resigned his living, having previously declined a bishopric from the royal favor, because of the strenuous conditions with which the gift was accompanied. For the remainder of his life he lived in retirement, venturing to preach only on one occasion (in the absence of the curate of the church he frequented), on which occasion he gave offence to the royal party, and was imprisoned in Newgate. He was soon, however, released. The great fire of London so affected him that it precipitated his death. II. EDMUND, the grandson of the above, born in London in 1871, died June 3, 1782, was educated in England and at the university of Utrecht, where he enjoyed the distinguished favor of many literary men. He had the offer of a professor's chair in the university of Edinburgh, which he declined, and returned to England, having favorable introductions from scholars on the continent to distinguished English divines. But Calamy soon determined to be a non-conformist, which determination he carried out with great decision and earnestness to the end of his life. Beside holding various important appointments as a non-conformist divine, he published some works which evince his talent and zeal. Among them may be mentioned a continuation of the "Life and Times of Baxter," which went through 2 editions during his lifetime, and brings the history down to the passage of the "Occasional Bill" (1713); a vindication of his grandfather and several other non-conformists (1718); and a continuation of the lives of ejected ministers, lecturers, masters, &c., after the restoration (1728).

CALANCHA, FREY ANTONIO DE LA, a Peruvian writer, born at Chuquisaca toward the end of the 16th century, died near the middle of the 17th. He was member of an Augustine convent at Lima, and in 1619 prior of his order at Truxillo. During the earthquake which in that year devastated that city, Calancha displayed the greatest firmness, and putting himself at the head of his order, he became of great service to the frightened inhabitants. He wrote a work on Peru, which was published at Barcelona in 1639, under the title of *Cronica moralizada del orden de San Augustin en el Peru*. In 1653 an abridged French edition of this work appeared at Toulouse, under the title of *Histoire de l'eglise du Pérou*.

CALANDAR, CHARAF BOU ALI, a Mussulman fanatic and saint of the 13th century. At Delhi he became acquainted with Khadja Couth Ouddin, and in Asia Minor he was on terms of intimacy with Chams Tabriz, a Persian poet, and with Maulavi Roum, a Mussulman mystic, the founder of the order of the Maulavi, and the author of the poem "Masnavi." In his youth Calandar had devoted himself to the

study of the natural sciences; but as soon as (to use his own expression) divine truth had flashed upon his mind, he threw all his books into the river Jumna, and consecrated the rest of his life to religion. After having completed his extensive travels, he returned to his native town, where he stood in the odor of sanctity. Even miracles were ascribed to him, and to this day devout Mussulmans make a pilgrimage to his grave.

CALANDSOOG, a village of Holland, on the North sea. It was the scene of a victory gained, after great loss, by the allied British and Russian forces over the Dutch, Aug. 27, 1799.

CALAS, JEAN, a French Protestant, born in 1698, in Languedoc, martyred March 9, 1762. He was a merchant at Toulouse, his wife an English lady of French extraction. One evening in Oct. 1761, after the family had retired from supper, his eldest son, Marc Antoine, a young man addicted to gambling, and of a gloomy disposition, was found dead at the entrance to his father's house. Beside the members of Calas's family, there was at the time no person in his house excepting M. Lavoysse, a young gentleman from Bordeaux. When the corpse of young Calas was discovered, the greatest excitement ensued, and the multitude of Toulouse, who especially at that time labored under the influence of religious agitation, ascribed the death of the young man to the fact that he had intended to become a convert to the church of Rome, and that his family had murdered him in order to prevent his secession from Protestantism. The honors of martyrdom were paid to young Calas by the Dominican friars and other Catholic bodies of Toulouse. He was buried with great pomp, a catafalque erected upon his grave, and a skeleton placed upon it, with a martyr's palm in one hand, and the act of abjuration in the other. M. Calas the father was sentenced to die on the wheel by a tribunal of 18 judges, only 5 of whom dissented from the verdict. His youngest boy, doomed to exile, fell into the hands of the priests, who threw him into a convent, with a view of forcing him to abjure Calvinism. The daughters were imprisoned in a nunnery. A Catholic servant in Calas's family, and Lavoysse, were acquitted, although there was much ill feeling against the latter, as he was suspected of being a missionary of the Huguenots of Guienne. The wife succeeded in escaping to Switzerland, where Voltaire, who then resided at Ferney, became interested in the case; and it was due to his interference that Elie de Beaumont and other eminent lawyers took it in hand, and obtained a reversal of the judgment. The Calas family were declared innocent, and a pension of \$6,000 granted to them by Louis XV.

CALASIO, MARIO DE, an Italian Hebrew scholar, born 1550, in the kingdom of Naples, died 1620, perfected his knowledge of Hebrew while member of a Franciscan convent to such an extent that he became professor at Rome,

and author of a Hebrew grammar and dictionary. His fame, however, rests upon his commentary on the Bible, which gives not only the Hebrew, but also the Latin version, affording at the same time opportunities of comparing the text with the Syriac, Arabic, and Chaldean languages. This work, which is highly valued by theologians of all denominations, was published one year after his death, at the expense of the pope Paul V. and Gregory XV., and edited by one of Calado's friends, Michel Ange de Saint Romulo. A 2d edition, revised by Romulo, appeared at London in 1747, but the original edition is the best.

CALABUNGAY, the name of a numerous tribe of once piratical savages, inhabiting the Spanish province of Misamis in the island of Mindanao. Ten years ago this people were in the lowest state of nature in which man is found, seeking shelter with apes in tree tops and the clefts of rocks, and, like them, subsisting upon the raw produce of the forest and the water. In 1849 a mission was established among them by Spanish missionaries, of the same indefatigable and devoted class who have brought about such remarkable changes in the mental and physical condition of many of the wild tribes of the Philippine archipelago. The Calabungays have abandoned their old haunts in the inaccessible jungles bordering upon the Gunung Inagawan range of mountains, and are now to be seen established in communities, cultivating the soil of the plains that border upon the Lupagan and Legan rivers, and the bay of Iligan. Considerable quantities of grain gold have been recently discovered in several streams descending from Gunung Inagawan, and a large portion of the Calabungays are actively engaged in gold washing. The auriferous soils of Mindanao have long been esteemed, by well-informed Spaniards in the Philippines, as much richer than those of Borneo, Sumatra, Celebes, or of any other portion of the Malay archipelago. But the wild and apparently irremediable character of the northern tribes of Mindanao, and the desperate ferocity of the Lanan pirates, who possess its southern coast, have effectually checked Spanish enterprise upon the island until recently. The missionaries have opened the way to the gold regions, and to many valuable products peculiar to this island; and should their success with other tribes be equal to what has been effected among the Calabungays, the island of Mindanao, deemed hitherto inaccessible on account of the ferocity of its people, will present as interesting a spectacle as Luzon or New Zealand, which exhibit the best specimens of a roving barbarism converted to civilization.

CALATAYUD, a Spanish town in the province of Saragosa, on the Jalon. The desolate and half ruinous condition of its streets destroys the favorable impression produced by the external appearance of the town. It stands in the midst of a fertile district, and provisions of all kinds are cheap. There are some factories in the town, beside an episcopal palace, convents,

churches, barracks, hospitals, and various public buildings. Mineral springs and establishments exist in the vicinity, and the remains of the ancient Babilis, the birthplace of Marius, are not far off. Pop. in 1852, 6,893.

CALATRAVA, José Maria, a Spanish statesman, born at Madrid, Feb. 24, 1791, died Jan. 24, 1846. A lawyer by profession, he distinguished himself as an orator in the cortes of Leon and Cadix, and was exiled in 1816 on account of his liberal principles. In 1820, when the new constitution was promulgated, he was allowed to return, was elected to the national cortes by his native district, and took a prominent position in opposition to Martínez de la Rosa. During the revolution of 1823, he officiated as minister of justice under the revolutionary government, at Seville and Cadix, but on the advent of a French army in aid of Ferdinand VII., he was obliged to escape to England, where he remained until 1830, and where he continued to agitate as member of the junta of Bayonne. In 1834, after the death of the king, he brought about the establishment of juntas at Beshjoe, Saragosa, &c., which proclaimed the constitution of 1812; and the result of this agitation was that, on June 18, 1837, Maria Christina promulgated a constitution more adapted to the requirements of the people. For some time he was member of the cabinet minister of justice, but dissenting from the policy of Martínez de la Rosa, he tendered his resignation. He continued, however, to organize juntas, and, owing to his machinations, Espartero's deposition from the regency was decided upon by the cortes, Aug. 16, 1843. Subsequently Calatrava was elected member of the Spanish senate by several provinces, and this nomination was ratified by Queen Isabel II., soon after her advent to the Spanish throne.

CALATRAVA LA VIRJA, a ruined city of Spain, on the Guadiana. It contains the remains of the ancient city of Calatrava, which during the middle ages was considered the key of the Sierra Morena, and was well fortified. The knights of Calatrava, members of a military order founded here in 1158, distinguished themselves by their exploits in the Moorish contests, but with the lapse of years the institution gradually degenerated, and toward the close of the 15th century the grand-mastership was united to the crown. Since 1808 it has been used as an order of merit. The ancient name of Calatrava was Oretum or Orib.

CALAVERAS, a county in the N. central part of California, bordering on Utah, and bounded on the S. E. by the Stanislaus river. It comprises an area of 5,000 sq. m. The Sierra Nevada, or Snowy range of California, passes through its centre, and it is drained by the Calaveras, Mokelumne, Walker's, and Carson's rivers. On Chiyote creek, 4 miles S. of Vallecito, are 3 natural bridges. Mining, especially for quartz, employs a large proportion of the capital of the inhabitants. The productions in 1836 were estimated at 25,496 bushels of

use. It consisted essentially of short barrels, upon whose circumference the 10 figures were inscribed, covered by a box, 1 figure alone of each barrel being visible through a row of little windows on the upper surface of the box. These barrels were so connected that 10 revolutions in one produced 1 revolution in the next, the revolutions of the 1st barrel being performed by hand to correspond with the numbers to be added. Subtraction was performed by the device recently reinvented in this country ("Montreal Proceedings of the American Association for the Advancement of Science") of having each figure on the wheels accompanied by a smaller figure, such that the sum of the 2 was equal to 9. Whatever number was added to the large figures was, of course, subtracted from the smaller. In 1673 Leibnitz published a description of a machine (*Miscellanea*, tom. i., Berolin) which was much superior to that of Pascal, but complicated in construction and too expensive for the work which it was capable of performing, which was only that of arithmetical addition, subtraction, multiplication, and division. But the glory of Pascal and Leibnitz, as inventors of calculating machinery, has been entirely eclipsed by Charles Babbage and by Messrs. G. and E. Schentz. The British government began in 1821 to build a machine under Mr. Babbage's direction. Early in 1838 a small portion of the machine was put together, and was found to perform its work with the utmost precision. In 1834 Mr. Babbage commenced the design of a far more powerful engine, but nothing has been done toward its construction. These machines of Babbage are enormously expensive, \$80,000 having been spent in the partial construction of the 1st. They are designed for the calculation of tables or series of numbers, such as tables of logarithms, of sines, &c., and are based upon the fact that if we make a new table, consisting of the differences between the successive numbers of the 1st table; then a 2d table, consisting of the differences of the successive numbers of the 1st table; then a 3d table, consisting of the differences of the successive numbers of the 2d table; then a 4th table in like manner from the 3d; and so on, we shall at length generally obtain a table in which the numbers are all alike. If we had then given to us the 1st number in each of these tables, we might, beginning with the table in which all the numbers were alike, get back to the original table, by a simple process of addition. Thus, by this principle of differences, the computation of all tables is, in general, reduced to a process of addition. The machine prepares a stereotype plate of the table as fast as calculated, so that no errors of the press can occur in publishing the result of its labors. Many incidental benefits arose from the invention, and among them the most curious and valuable was the contrivance of a scheme of mechanical notation by which the connection of all parts of a machine, and the precise action of each part, at each instant of time, may be rendered visible on a diagram, thus enabling the contriver of machinery to devise modes of

economizing space and time by a proper arrangement of the parts of his invention. This mechanical notation of Babbage ("Philosophical Transactions," 1836) is for an inventor of machinery what the notation of algebra is to the student of geometry. The machine purchased for the Dudley observatory by Mr. Rathbon of Albany, at the suggestion of Dr. B. A. Gould, was invented by G. and E. Schentz of Stockholm, and finished in 1853. The Swedish government paid \$20,000 as a gratuity toward its construction. The inventors sought to attain the same ends that Mr. Babbage had attained, but with simpler means. Their engine proceeds by the method of differences, calculating to the 15th place of decimals, and stamping the 8 left hand places in lead, so as to make a stereotype mould from which plates can be taken by either a stereotype or electrotype process, ready for the printing press. It can express numbers either decimally or sexagesimally, and prints by the side of the table the corresponding series of numbers or arguments for which the table is calculated. It has already been employed at Albany in calculating a table of the true anomaly of Mars for each $\frac{1}{12}$ of a day. Mr. Babbage has seen this machine and given it the most cordial praise. In size it is about equal to a boudoir piano.—("Edinburgh Review," July, 1834; Babbage's "Ninth Bridgewater Treatise;" *Encyclopédie méthodique* (Art. *Arithmétique, et Équation*); "Napier's Life," by Mark Napier.)

CALCULI, stone-like concretions which form in different parts of the body, often about some undissolved particle in the fluid, which holds the matter of the concretion in solution, and again as a deposit upon some hard surface, as the tartar which collects upon the teeth. In the intestines the concretory deposits are sometimes mechanical agglutinations of dry fibrous particles, as the fine down of the oat gathered about a piece of bone or stone of some fruit, and intermixed with layers of phosphate of lime. The fluids of the body may deposit concretions in most of the vessels, organs, and tissues. They are left by the blood in the arteries and valves about the heart; by the saliva in the mouth, in the substance of the cheek as well as upon the teeth; by the bile in the gall-bladder; they are found in the tissues of the lungs and in the bronchial glands, and in gouty persons under the skin, about the joints of the fingers and toes, &c. But their most common occurrence is in the kidney, bladder, and urinary passages, left by decomposition of the complex fluid of these organs. Urinary calculi are variously composed, and may be classed as those which are soluble in caustic potash or soda, and those which are insoluble. One of the most common of the former class is the uric acid calculus. This ingredient in urine, when secreted in undue proportion, forms minute red crystals and red sand, which are passed in a solid state. If retained, they increase in size and produce the disease called the stone. The acid, if greatly in excess, is deposited in successive layers,

forming yellowish-colored stones of such size that they can be removed only by the operation either of lithotomy, which is making an incision into the bladder and removing the stone by forceps, or of lithotrity, which is the introduction of an instrument into the urethra, by which the stone is broken, so that it may be removed by voiding it in fragments. If the uric acid is not in excess, the concretion once produced is liable to be covered with an incrustation of an ammonia-phosphate of magnesia or of a phosphate of lime, and thus increase in size. These phosphates when deposited alone, as is sometimes the case, are included among the insoluble calculi, of which other varieties are produced in the forms of crystals of oxalate of lime, called, from their resemblance to the mulberry, the mulberry calculus, of a brown color and octahedral form, or shaped like a dumb-bell, which are sometimes nuclei for the uric acid calculus; and again as carbonate of lime, which are of rare occurrence. Other calculi, which belong to the soluble class, are formed with uric acid in combination with ammonia; others of cystic acide or cystine, and of xanthic oxide or xanthine. These are distinguished from each other by their various shades of color, different degrees of hardness, and their peculiar reaction with different chemical agents, but more readily than all by the peculiar shapes they assume, which are strongly marked, and unlike those of any other substances. Concretions of uric acid are not uncommon with children, and recur in the same persons in advanced age. These are most liable to them who suffer from dyspeptic and gouty tendencies, as well as from a scorbutic habit, or tendency to cutaneous diseases. A premonition of their appearance is an habitual turbidness of the urine. When this is observed, serious trouble may in most cases be obviated by particular attention to the diet, and by the use of proper medicines; but if the concretions are allowed to increase till they are too large to be passed, there is then no other recourse to be looked to but an operation; for, once formed, they are never afterward absorbed, nor is any solvent for them discovered, upon which dependence can be placed.—Calculi deposited by the bile in the gall bladder, the liver, and its ducts, are known as biliary concretions and as gall-stones. They are usually of a round or oval form, and of various colors, as white, yellow, brown, and dark green. Sometimes they are soft, and sometimes brittle and easily pulverized to an unctuous powder; their size has, in some cases, reached that of a walnut. In men they generally consist of cholesterin, more or less intermixed in the mass and coloring matter of the bile; but some have been found consisting of carbonate of lime 72.7 per cent., phosphate of lime 13.51, and mucos 10.81. In animals their composition is very variable; some consisting of the same ingredients as are found in those of men, and some, as has been observed in a calculus taken from an ox, con-

taining little else than margarine and margarinic acid. Domesticated animals are very subject to this disease in some of its forms. Almost every ox that is slaughtered has several calculi in the gall bladder. Horses are destroyed by them in the intestines and in the brain; and in the stomachs of ruminating animals they are found in the form of balls of hair, earthy matter, and find encasement around some hard central nucleus.

CALCULUS, in mathematics, a mode of calculating. In this broad signification we may speak of common arithmetic and algebra as forms of a calculus. Thus also trigonometry is called the calculus of sines, and the doctrine of chances is spoken of as the calculus of probabilities. The branches of mathematics to which the term is more especially applied are the differential calculus, integral calculus, calculus of variations, to which we may add the calculus of imaginaries, that of residuals, and that of quaternions.—The IMAGINARY CALCULUS investigates the nature of quantities which are required to fulfil apparently impossible conditions. It has been discovered by means of this calculus that every absurdity in geometry can be reduced to an attempt to measure a straight line in a direction different from that of its length; and that every algebraic absurdity can be represented by one symbol, always capable of this one geometrical interpretation. This extensively useful calculus has been chiefly developed by M. Cauchy.—The RESIDUAL CALCULUS investigates cases of apparent impossibility, arising from the attempt to measure a quantity which has become immeasurably great. Imaginaries and residuals are chiefly employed as subsidiary to the operations of the higher species of calculus.—The DIFFERENTIAL CALCULUS, invented by Leibnitz, is identical in its nature with the fluxional calculus of Newton, differing only in the form of its thoughts and language. It investigates cases of apparent impossibility arising from the attempt to measure quantities immeasurably small, and evades the difficulty by measuring the ratio which such quantities bear to each other. Its use arises from its capability of measuring the rate of change in variable quantities. The problems of this calculus are always of this form, "to find how the change in some variable quantities alters at each instant the value of a quantity dependent upon them." When the changes are gradual and the investigation covers each point of the way, the changes are called differentials. If the change is by distinct steps, the changes are called differences, and the forms of calculation are somewhat different.—The INTEGRAL CALCULUS is the reverse of the differential, and seeks to find from a known ratio between the changes of two quantities (mutually dependent on each other) what the unknown relation or law of dependence between the quantities themselves must be; or, in the language of the calculus, the integral of a given function (*i. e.* a law of dependence) is a required

new function of which the given function is the differential.—The CALCULUS OF VARIATIONS investigates the changes produced by gradually altering the laws of dependence which bind the variable quantities together. This invention of Lagrange crowns the calculus of functions, which by means of these five branches is capable under a master's hand of tracing out very complicated and intricate chains of inter-dependence in every part of the domain of quantity. And yet there is not one of these calculi that can answer all the questions which the physical sciences ask of it. More powerful engines of analysis may yet be invented by future mathematicians.—The CALCULUS OF QUATERNIONS, published by Sir W. R. Hamilton in 1853, promises to do something toward supplying this defect. By combining in one notation the direction as well as the length of line, he is enabled to express in a single symbolical sentence an amount of geometrical truth, which in ordinary analytical geometry would require at least four sentences. No other writer has yet mastered this powerful instrument sufficiently to use it with ease; but the verdict of mathematicians is unanimous in praise of its ingenuity, and probable future utility.—The difference between the powers of the principal calculi may be familiarly illustrated by the cycloid, a curve described by a nail head in the tire of a wheel rolling on a straight level road. The differential calculus would investigate the direction in which the nail head moves at each instant of its motion, and show the proportion between its rise, its fall, its horizontal motion, its motion through space, the curvature of its real path, and the revolution of the wheel at each instant. The integral calculus would, from these elements, discover how far the nail head travelled in one revolution of the wheel, how much space is enclosed between its path and the ground, &c., &c. The calculus of variations would consider the change made by the wheel rolling over a hill; or would show how the cycloid differs in its properties from similar curves.

CALCUTTA (*Kali Ghatta*, the ghaat or landing-place of Kali, the goddess of time), a city of Hindostan, capital of the presidency and province of Bengal, and the metropolis of British India, situated on the left bank of the Hoogly, 100 miles from the sea, lat. 22° 35' 5" N., long. 88° 19' 2" E. Its foundation is due to Mr. Job Charnock, an agent of the East India company, who removed the company's factories from the town of Hoogly to this place in 1686. This establishment was broken up a few months after, but was restored in 1690. In 1700, 8 small villages near the factories, one of which bore the name of Calcutta, were assigned to the British by way of return for a present made by them to Azim, a son of Aurungzebe. They were immediately fortified, and in compliment to the reigning king of England, called Fort William—a name which is still retained in parliamentary documents. One of these villages occupied the site of the present European quar-

ter, another stood where the native residences are now erected, and the 8d has given place to a beautiful plain or maidan on the S. side of the city, in the midst of which stands the new citadel of Fort William. Under the protection of the old fortress, now converted into a custom-house and warehouse, a town gradually arose, which in 1707 was made the seat of a presidency. In 1756 it was attacked by Surajah Dowlah, nawaub of Bengal. The garrison, composed of 170 English troops, 1,500 natives, 94 of mixed races, and a militia raised among the inhabitants of 250 men, in all 2,014 soldiers, were ill prepared for such an event; the natives soon made their escape; the governor and commandant, with the greater part of the inhabitants, followed their example; and when the enemy forced their way into the town (June 20), only 146 men fell into their hands. The sufferings of this little band, in the dungeon known as the "Black Hole," have been described in a previous article (see BLACK HOLE). Eight months afterward, Clive and Watson recaptured the town; peace was restored, valuable concessions were obtained from the native rulers, and Calcutta resumed its career of prosperity. In 1758 Meer Jaffer, the successor of Surajah Dowlah, remitted the rent which the East India company had previously paid for the tenure of the city.—On ascending the Hoogly, the scenery, which for many miles from the sea is dreary and uninviting, becomes more picturesque as one approaches Calcutta. On the left are the botanical gardens, stocked with many varieties of indigenous and exotic plants, and the Bishop's college, a handsome Gothic edifice erected under the auspices of the society for the propagation of the gospel in foreign parts; on the right is the beautiful suburb of Garden Reach, with its country seats surrounded by elegant gardens. North of this are the government dockyards; beyond them is the arsenal, and still further up the stream, in the esplanade which forms the southern limit of the city, rise the ramparts of Fort William, reputed the strongest in India. This fort, begun by Clive in 1757 after the battle of Plassey, requires for defence 600 pieces of cannon and a garrison of 9,000 men. From here the city extends about 4½ miles along the river, and has an average width of 1½ mile, and an area of 8 miles. On the land side it is encompassed by a spacious way called the circular road, marking the boundary of the city and of the administration of English law. Its water front is bordered by a quay called the strand, 40 feet above low-water mark, and 2 miles long, with ghats, or landings, at intervals. The appearance of Calcutta from the river is magnificent, and seems to justify the appellation of "City of Palaces," so often bestowed upon it. But a closer inspection shows that although the European buildings, both public and private, are nearly all splendid and extensive, the natives, who occupy a distinct quarter of the town, are surrounded by poverty and filth. Their houses

are built of mud, or bamboo and mats; the streets are narrow and unpaved, and until a few years ago were often filled with stagnant pools of water. This section, which forms the northern part of the city, is called the Black Town. The European houses are built of brick covered with stucco, are generally detached from one another, and have spacious verandahs. Most of them are situated E. of the fort, in the Chowringhee quarter, where the streets are wide and handsome. The principal public buildings are the government house, surmounted by a large dome, and fronting on the esplanade; the custom-house, town-hall, treasury, mint, cathedral of St. Paul, a splendid Gothic structure commenced in 1839, 4 Roman Catholic churches, 6 Anglican churches, 7 churches and chapels of other Protestant denominations, a Greek and an Armenian church, a synagogue, 74 mosques, 167 Hindoo temples, and 1 Chinese temple. There are numerous educational establishments, including the university, founded in place of the former Fort William college, the college Panchala and the Bengal school, the Hindoo college, the Madrasa or Mohammedan college, the Sanscrit college, the Marinière, founded under the will of Gen. Claude Martin to afford instruction to poor children of both sexes; St. Xavier's college, directed by the Jesuits, and various missionary schools and academies for both sexes. There are 5 hospitals, a lunatic asylum, an asylum for lepers, a sailors' home, a fund for the indigent blind, 2 orphan asyloms, dispensaries, a savings bank, 2 other banks, and several commercial associations. Among many scientific associations, the most famous is the native medical college. The city is supplied with water from large tanks which obtain their stores from periodical rains. There are no less than 1,043 of these, 15 of which are public. The shops or bazaars are furnished with a plainness which must strike a stranger forcibly, but every kind of goods of every quality can be purchased as readily as in England. The principal suburbs, after Garden Reach, are Alipore, Ballygunge, Estally, Sealdah, and Simla, the last 3 being occupied mainly by natives. The climate, formerly considered exceedingly dangerous to foreigners, has been much ameliorated by clearing away the surrounding jungle, draining, &c. The temperature during the bracing cold season, from the 1st of November to the end of February, ranges from 70° to 75°. From this time until June the heat increases, reaching 100° and 110° in the open air. It is followed by the rainy season, which lasts till October.—The population of Calcutta according to the census of 1850, the last taken, was as follows:

Europeans	6,000
Europeans (number of white fathers and mothers)	4,615
Assamites	892
Chinamen	547
Armenians	35,812
Indians	274,585
Mohammedans	120,919
Total in the city	413,182

Including the suburbs, the population is about 800,000. The British merchants form the most respectable and wealthiest class. The Armenians are largely engaged in commerce with various parts of the East, and the retail trade is almost monopolized by the natives. The principal factories in the city and neighbourhood are a government foundry, a sugar manufactory, several corn, flour, and oil mills, a boiler manufactory, and the Gloucester cotton mills. The exports are opium, indigo, sugar, salt-petre, rice, cotton, hides, lac, &c.; the imports are metals, piece goods, twist and yarn, salt, betel-nut, glass ware, wines, woollens, books, &c. The commerce of all the interior of Bengal, and almost of the whole of India, centres here. The imports of Calcutta in 1850, covered a value of \$42,000,000, and the exports \$56,000,000. The entrances and clearances amounted in 1856, to

1,501 British vessels, tonnage, 780,805	
724 Foreign " " " " " " " "	841,912
Total	2,225 vessels, 1,622,717 tons.

About 500 vessels are annually engaged in the coasting trade. The opium sales of the East India company at Calcutta in 1850, were to an extent of \$10,000,000. The trade is carried on chiefly by the Hooghly, which communicates with the Ganges, and with the bay of Bengal. It is here about 1 mile wide, and is navigable by vessels of 1,400 tons. A railway from Howrah, opposite Calcutta, was completed as far as Bardwan, in the early part of 1857, and when entirely finished will establish a connection with the upper regions of the Ganges. Its length will be 1,350 miles. Electric telegraphs between the principal cities of India have been in operation since 1855. Continuous communication is kept up with Great Britain by line vessels sailing around the Cape of Good Hope, and by the peninsular and oriental and the eastern steam navigation companies, which carry mails and passengers by what is called the "overland route," viz. through the Mediterranean to Alexandria, thence by land to Suez, and thence by steamer to Calcutta. Calcutta is the seat of the governor-general of India, of the lieutenant-governor of the presidency of Bengal, of the important courts of law and of an Anglican bishop. The city is also the focus of the missionary enterprises in East India, and missionaries of all denominations, comprising also within the last few years those of the Unitarians, are to be found there. Several newspapers and magazines are issued in Calcutta; of the former must be mentioned the "Herkaru," the "Englishman," the "Calcutta Gazette," the "Friend of India," the "Calcutta Asiatic Observer," the "Bengal Observer," and among the latter the "Calcutta Review." The journals here enumerated are written in English, but there are several published in Persian and Armenian, and in the different native languages.

CALDANI, LEOCORDO MANCO ANTONI, an Italian anatomist, born in Bologna, Nov. 24,

1725, died in Padua, Dec. 30, 1818. He was professor of anatomy in the university of Bologna, where, after a great number of experiments, he published his work on the "Insensibility of Tendons." But impatient of the contradictions which his views received, he left Bologna for Padua, and succeeded Morgagni there. At an advanced age, and with weak eyes, he published, with some assistance, a series of accurate anatomical plates.

CALDARA, ANTONIO, a composer, born at Venice in 1678, died there in 1768. At the age of 18 he wrote an opera, which was successful, and for many years thereafter devoted himself exclusively to that species of composition. He was for a while instructor in music to the emperor Charles VI. at Vienna. He abandoned the stage on the failure of his opera of "Themistocles," and during the remainder of his life wrote sacred music, which is generally preferred to his operas.—POLDORO, a Milanese painter, also called Caravaggio, after the name of the place where he was born in 1495, died in 1548. When a poor boy he came to seek his fortune at Rome; he was employed in carrying mortar for the artists who were engaged in fresco painting in the Vatican. The artists, who happened to be all pupils of Raphael, were struck with his talents, and admitting him to their studios, he made such rapid progress that Raphael selected him to paint the friezes to his works in the Vatican.

CALDAS, FRANCISCO JOSÉ DE, a naturalist of New Granada, born at Popayan in 1770, executed by order of Morillo, 1816, on account of his liberal political opinions. By his own unaided efforts he mastered the rudiments of astronomy, botany, and medicine, and constructed a barometer and sextant, although he had not even books to guide him in his studies. He accompanied for some time the Spanish explorer, J. O. Mutis. Subsequently he explored the Andes and the Magdalen river, and in 1804 measured the height of Chimborazo and Tunguragua. After having been nominated director of the observatory at Santa Fé de Bogota, he began to edit in 1807 the *Semanario de la Nueva Granada*, which was unfortunately interrupted by his untimely death.

CALDAS PEREIRA DE SOUZA, ANTONIO, a Brazilian poet, born in Rio de Janeiro in 1762, died in 1814. His writings, which are marked by a high moral tone, especially an ode on "Man in the State of Barbarism," were published in Paris in 1821, under the title of *Poesias sagradas e profanas*, with a commentary by Gen. Stookler. At Coimbra, where the poet had studied, a new edition of his poetical works, exclusive of his translations, was brought out in 1836. While at the university of Coimbra, he gave umbrage to the inquisition; and on being consigned to a convent, he devoted himself to the clerical profession.

CALDER, a river of England, in Yorkshire, West Riding. It rises near Burnley, on the E. borders of Lancashire, and thence flows E. until

reaching Wakefield, where it makes a bend to the N., and joins the Aire near Castleford, after a course of 40 miles, for 80 of which it is navigable. It is important as a part of the transportation route across the kingdom from Liverpool to Hull, and is connected by canals with Todmorden, Rochdale, Huddersfield, Goole, Halifax, and Barnsley.—Another stream in Lancashire, and 2 in Scotland, bear the same name.

CALDERINO, DOMIZIO, an Italian scholar, born at Torri in 1447, died in 1478. At the age of 24 he became professor of belles-lettres and secretary of Sixtus IV. at Rome. With Valla and Politian he edited and published the earliest editions of the Greek classics.

CALDERON, SERRAFIN, a Spanish poet, born at Malaga in 1801, studied law at Granada, was professor of poetry and rhetoric in 1822, and then practised law; published in 1833 his *Poesias del Solitario*, and in 1840 two volumes of poetry; to the *Cartas Españolas* in Madrid he contributed Andalusian sketches; wrote a work which the interests of Spain particularly required on administrative principles, at the instance of the government; in 1834 he became auditor-general of the army of the north, and in 1836 civil governor of Logroño; in 1838, withdrew from politics. In 1838 he published *Cristianos y Moriscos*, a novel. He is a good Arabian scholar, and thoroughly familiar with Moorish literature. He has made a collection of *Cancioneros y Romances*, which he proposes to publish.

CALDERON DE LA BARCA, FRANCES ESKINZ, authoress of "Life in Mexico," born at the beginning of this century in Scotland. Her father, Mr. Inglis, was a grandson of Col. Gardiner, who fell at Preston-Pans. She resided in her youth for several years in Normandy, and then emigrated with her mother to the United States, where they established a school at Boston, in which the daughter officiated as teacher for 6 years. In 1838 she married the Spanish minister at Washington, Don Calderon de la Barca, and afterward accompanied her husband to Mexico. In 1843 she published her work on Mexico, which gained for her considerable literary reputation.

CALDERON DE LA BARCA, PEDRO, a Spanish dramatist, born in Madrid, Jan. 17, 1600, died May 25, 1681. His father was secretary of the treasury under Philip II. and Philip III. He received his first education from the Jesuits, and subsequently studied theology, philosophy, and civil and canon law at Salamanca. While in the university, at the age of 14, he wrote his first play for the stage, *El Carro del Cielo*. In 1625 he enrolled himself as a common soldier in the army, and took an honorable part in the military operations at Milan, and in the Netherlands. In 1636, Calderon was formally attached to the court, as the successor of Lope de Vega, for the purpose of writing plays for the royal theatres. As a member of the military order of Santiago he was called to serve in quelling the Catalonian rebellion in 1640. In

great haste he finished a drama which he had just begun (*Cherismen de Amor y Zelos*), and then joined the army. In 1640, when the new queen, Anna Maria of Austria, made her entrance into Madrid, Calderon presided over the festal arrangements. As his reputation increased, his literary activity increased also. He wrote secular plays, autos, or religious plays, odes, songs, and ballads for the academies of which he was a member, and for the popular poetical festivals. In 1651 he entered a religious order; in 1653 he became chaplain to the royal cemetery at Toledo; in 1659 the king, in order to secure his presence at Madrid more regularly, appointed him chaplain of the palace. In the same year he became a priest of the congregation of San Pedro, and soon rose to be its head. Without interfering in the least with his labors for the theatre, these ecclesiastical connections brought him orders for religious plays from Seville, Granada, Toledo, and other influential cities, in addition to the plays which he regularly furnished to the city of Madrid for the great annual festival of Corpus Christi. Like Shakespeare, Calderon took little interest in the publication of his plays, with the exception of some of his religious pieces, which he revised before they went to press. Beside 108 comedias, he wrote 73 religious plays, or sacramental autos, and 15 full-length religious plays. The performance of these took place in the afternoon during religious festivals before the people and the court, and concluded with music and dancing. These entertainments were organized by the church, and took place daily for a month, the regular theatres being shut, and the whole population being in the public streets to witness the performances, and also to admire the fantastic figures of giants and other curious exhibitions than to be seen. Calderon's autos turn upon scriptural and Spanish history. Satan takes a prominent part in the plays, and Quevedo says that his "personage comes on the stage dressed finely, and talks as if the theatre were altogether his own." Passages of fine lyric poetry abound. One of the most important of the religious plays, by the comprehensiveness of its allegories and the superior merit of its poetry, is the "Divine Orphan." Of his full-length religious plays, the "Purgatory of St. Patrick," besides its religious connection with the patron saint of Ireland, has a love-plot, which savors of any thing but sanctity. His "Devotion to the Cross" is celebrated for its devotional passages, and has been translated into German by A. W. von Schlegel. The "Wonder-working Magician," founded on the story of St. Cyprian, bears of the most picturesque and interesting of his religious plays, which include also one on the conquest and conversion of the Indians in Peru, *Aurora in Cypseliana*. His secular plays are intriguing, like "Nothing like Silence;" heroic, like "A Friend Loving and Loyal;" while a few are passionately tragical, like "Love survives Life," and the "Physician of his own Honor." The most curi-

ous historical and geographical coincidences repeatedly occur in the plays. In the *Venganza del Sagrado*, a bishop of the 8th century gives, upon the authority of Herodotus, a description of America, which was discovered after the good man had mouldered in his grave for 700 years. In his *Afueras de Odisy y Anar*, the Austrian river Danube is transferred half way between Russia and Sweden. Calderon relished this confusion more than any one in his audience, and in his *Los Dos Arzobispos del Cielo*, a pagan clown of ancient Rome is beginning to prate about friars, as if friars had existed in heathendom, when Calderon makes him correct himself; and with indescribable drollery in his manner, the clown adds:

—En no es bueno—
Porque no es ay en Roma fregas.
—a Niss, but that's not right,—there are no fregas
As yet in Rome.

Nor is he very particular about preserving the national individuality of his characters. His Zenobia, Japangui, Judas Maccabeus, &c., might as well have been brought up on the shores of the Ebro, as on those of the Nile or the Peruvian lakes. Like Shakespeare, he sacrifices all conventional rules, and concentrates his whole genius upon the production of the utmost effect upon the audience, and in this he succeeds. His drama, "No Monster like Jealousy," exhibits, next to Shakespeare's *Othello*, perhaps more powerfully than any other dramas, the passion of jealousy upon the stage. The "Physician of his own Honor" is one of his most popular comedies. The "Firm-hearted Prince," and "Life is a Dream" (included in Schlegel's translations), are great favorites on the German stage. The great Cornelle took his *Horodius* from Calderon's drama of the same name; and his *No hay Verdad en el Amor* suggested to Moliere the *Femmes Savantes*; his *Astrologo Fingido*, to Thomas Cornelle the *Priest Astrologer*, from which Dryden took "An Evening's Love, or the Mock Astrologer." His "Fairy Lady," "Seari and Flower," are among the most effective of comedies. The "Last Duel in Spain," "Hate and Love," and other plays, were peculiarly attractive at the time of their representation by the contemporary allusions which they contained, the latter referring to Christina of Sweden. Some of his plays were brought out with great pomp, as "Love the Greatest; Enchantment," in a floating theatre, erected on the artificial waters in the gardens of the Buen Retiro. He wrote his last drama, *Hado y Desdha*, founded on the fictions of Bolardo and Ariosto, in his 51st year. Among the dramatists of other nations who have posessed most in Calderon's dramatic fields, are the younger Cornelle, and the Italian Gozzo. Several of his plays have been translated into German, and some of them into other languages. Many of them still maintain their popularity on the Spanish stage. Goethe said of Calderon, that he belonged to those

men who blend genius with the utmost common sense. His character presented a rare union of dignity and suavity, of industry and modesty.

CALDERWOOD, DAVID, a Scotch divine and prominent champion of Presbyterianism, born toward the end of the 16th century, died in 1651. He underwent imprisonment and exile on account of his opposition to Episcopacy, having published in Holland, in 1628, a book against that form of Christianity, under the title of *Altare Damascenum*. He left a history of Scotland in MS., of which 6 volumes are preserved in the library of the Glasgow university, and of which a condensed summary appeared in 1678.

CALDWELL, I. A north-western county of North Carolina, occupied chiefly by pasture lands, but producing also corn and oats; area, 450 sq. m. A portion of the surface is mountainous, the N. W. part comprising a declivity of the Blue Ridge. The productions in 1850 were 192,470 bushels of Indian corn, 84,406 of oats, and 89,813 lbs. of butter. There were 4 corn and flour mills, 1 linned oil manufactory, 84 churches, and 680 pupils attending public schools. Value of real estate in 1857, \$692,819. Pop. in 1850, 6,317, of whom 1,208 were slaves. Capital, Lenoir.

II. A northern parish of Louisiana, intersected by the Washita, which is here navigable by steamboats; area, 528 sq. m. The surface is hilly, and corn and cotton are the chief productions of the soil. In 1855 it yielded 2,957 bales of cotton, and 62,960 bushels of Indian corn. Capital, Columbia. Pop. in 1855, 8,685, of whom 1,779 were slaves.

III. A central county of Texas, named in honor of John Caldwell, a senator of the Texan republic; area, 540 sq. m. It has an undulating, well-wooded surface, and a good soil, abundantly watered by the San Marcos river, which forms the western boundary, and by several small creeks. In 1857 it contained 4,451 horses, valued at \$176,860, and 15,244 head of cattle, valued at \$89,180. Value of land, \$758,620. The staple productions are wheat, Indian corn, and cotton. Pop. in 1858, 5,469, of whom 1,861 were slaves. Capital, Lockhart.

IV. A county in the western part of Kentucky, bounded on the S. W. by the Tennessee river, and traversed by the Cumberland; area 700 sq. m. The surface is generally level, and the soil produces tobacco, corn, wheat, and oats. There are pasture lands scattered over the county; iron ore is abundant, and a large bed of coal has been opened in the northern part. Organized in 1809, and named in honor of a former lieutenant-governor of the state. The productions in 1850 were 767,725 bushels of Indian corn, 89,557 of oats, 1,435,479 lbs. of tobacco, and 20,649 of wool. There were 40 corn and flour mills, 7 saw mills, 10 distilleries, 8 large iron works, 2 newspaper offices, 30 churches, and 670 pupils attending public schools. Value of land in 1855, \$943,684. Pop. in 1850, 18,048, of whom 8,107 were

slaves. Capital, Princeton. **V.** A north-western county of Missouri, intersected by Shoal creek, and having a flat surface and a rich soil; area, 435 sq. m. It produces corn, wheat, oats, cattle, and swine, and in 1850 yielded 12,784 bushels of wheat, 16,135 of Indian corn, 45,740 of oats, and 18,691 lbs. of wool. There were 2 saw mills, and 115 pupils attending public schools. Named in honor of Dr. Caldwell, of Transylvania university, Kentucky. Pop. in 1856, 8,626, of whom 197 were slaves. Capital, Kingston.

CALDWELL, a post village in Warren co., N. Y. It stands in the midst of a beautiful and picturesque region at the southern end of Lake George, is much visited by tourists, and contains 1 or 2 large and favorite hotels. A steamboat plies between it and the outlet of the lake. It contains the ruins of Fort William Henry, and Fort George, memorable in the French and revolutionary wars. Pop. of the township in 1855, 860.

CALDWELL, CHARLES, an eminent American physician, born in Oaswell co., N. C., May 14, 1772, died in Louisville, Ky., July 9, 1853. He was the son of an Irish officer who had emigrated to this country, and ultimately settled where the subject of this sketch was born. While his parents remained in that remote district, Charles labored under great educational disadvantages, but after they had removed to the southern part of the state, he made such progress in learning that when a very young man he was qualified to become a teacher, and took charge of a seminary at a place called Snow Creek, near the foot of the Bushy mountains, and subsequently of the Centre institute, both in his native state. While instructing others, however, he did not neglect himself; but, assiduously pursuing his own studies, early acquired that taste for science which he ever afterward displayed. Having hesitated some time between the pulpit and the bar, he at last determined to abandon both, and to choose the profession of medicine in preference to either. An obscure practitioner at Salisbury was his first master in this profession. In 1792 he went to Philadelphia, and joined the medical classes of the university, which were then sustained by the talents and reputation of Shippen, Wistar, and Rush. Here he applied himself earnestly to both study and practice, and during the yellow fever of 1793, particularly distinguished himself by ability, courage, and zeal. At the outbreak of the whiskey insurrection, he was appointed surgeon to a brigade and accompanied it to the neighborhood of Pittsburg, but as soon as it was announced that the insurrection had subsided, the troops retired, and a military banquet was given by the army at which Surgeon Caldwell delivered an address that elicited a flattering compliment from Alexander Hamilton. In 1795 he produced his first literary work, a translation of Blumenbach's "Elements of Physiology," from the Latin. In 1814 he succeeded Nicholas Biddle as editor of the "Port Folio,"

to which he gave new efficiency by his talents and energy. In 1816 he edited Cullen's "Principles of Physic," while at the same time he filled the chair of natural history in the university of Pennsylvania. In 1819 he published his "Life and Campaigns of General Green," the most important and valuable of all his biographical works, and soon after removed to Kentucky to fill the chair of medicine and clinical practice at the Transylvania university, Lexington. In 1820 he made a tour in Europe in order to purchase books and philosophical apparatus for that institution. In 1827 he broke off his connection with the Transylvania university, to establish in the city of Louisville a medical institute, but in consequence of a misunderstanding with the trustees, he was removed from office in 1849 by the board of managers. He passed his latter days in Louisville, engaged in the composition of his autobiography which appeared after his death, and is a daguerrotype of the idiosyncrasies of the author. His principal literary works beside those already mentioned, are "Memoirs of the Rev. Dr. Horace Holley; and *Buchter Nones*, or "The Royal Foundling, a Persian tale, translated from the Arabic."

CALDWELL, HOWARD H., a living American poet, born in Newberry, S. C., Sept. 20, 1831. He graduated at South Carolina college in 1851, was admitted to the bar in 1855, and since that time has practiced his profession in Columbia. In 1853 he published a volume entitled "Ollatta, and other Poems." The chief poem of the collection is a romance of the American aborigines, and several of the others are translations. He has contributed frequently to the periodicals of the South, and a new volume of poems from his pen was published in 1858.

CALDWELL, REV. JAMES, an American revolutionary patriot, born in April, 1734, at a settlement called Cob creek, in what is now Charlotte co., Va., was killed by a British soldier, Nov. 24, 1781. He graduated at the college of New Jersey in 1759, and became pastor of the then large and important Presbyterian congregation at Elizabethtown. In March, 1765, he was married to Miss Hannah Ogden, of Newark, a lady whose tragic fate has made her name familiar to all readers of American history. During the progress of the difference between the mother country and the colonies, which immediately preceded the war, he warmly espoused the cause of the people, and by his personal influence and eloquence encouraged and increased the spirit of resistance. When hostilities actually commenced, he was appointed chaplain in the Jersey line, and acted in that capacity with those portions of the American army which successively occupied that state; he accompanied the Jersey brigade to the northern line, and in addition to his other duties performed those of commissary for some time. There was, probably, no other man in New Jersey whose influence with the people was so great, and to whose appeals they responded so readily and

effectively. He was consequently the object of hatred and persecution to the British and Tories, and in order to avoid the dangers to which he was continually exposed he removed his family to Connecticut Farms, a small village about 9 miles further in the interior of the country. The enemy were then in possession of New York and Staten Island, whence they made frequent incursions to New Jersey, on which occasions the bell of Caldwell's church was always used to sound the alarm and arouse the country. On Jan. 25, 1780, one of these marauding parties, consisting of 600 regular troops and a large number of Tories, surprised the picket guard at Elizabethtown, captured 9 majors, 2 captains, and 49 privates, plundered the inhabitants, and burned the town-house, Caldwell's church, and a private residence. It is not just to say, however, that the torch was applied to the church by a Tory, residing in the neighborhood, who, when he saw the building wrapped in flames, expressed his regret that "the black-coated rebel, Caldwell, was not then in his pulpit." The detachment immediately retreated, without loss, to Staten Island, where Gen. Knyphausen was in command. Having received exaggerated accounts of the recent mutiny of the Connecticut line, and of the general discontent which was said to be prevalent in New Jersey, the latter projected an expedition which left the island during the night of June 5, 1780, and landed at Elizabethtown Point before dawn on the following morning. It was composed of about 5,000 regular troops, with 17 pieces of artillery, under the command of Brig-Gen. Sterling; and it was hoped that such an imposing array would be sufficient to terrify the rebels, encourage the loyalists, and restore the Jerseymen to their allegiance. As the column approached the village of Elizabethtown, it was indistinctly seen in the darkness by a sentinel, who gave a challenge which was unanswered, and he immediately fired at random into the moving mass. The shot, which ultimately proved mortal, took effect in the thigh of Gen. Sterling, who was carried back to Staten Island, and Knyphausen himself took command. The march was resumed, but the alarm had been given and the Jersey regiment at Elizabethtown, under Col. Dayton, were ready to oppose their progress. Being too few in number to offer any effectual resistance, they retired in good order, skirmishing occasionally, until they reached Connecticut Farms, where they were met by the Jersey brigade under Gen. Maxwell, and some militia of the country who had hastily assembled, and a sharp action ensued. The invaders being reinforced by a second division which had just arrived from Staten Island, and having the advantage of artillery, were enabled to force their way some 8 miles further on the road toward Morristown, where Washington had his camp. Before reaching the village of Springfield they found that intelligence of their movements had been sent to head-quarters; that all necessary ar-

rangements had been made for the defence of the village; and that Washington had moved forward in person, and was strongly posted in the passes of the Short Hills, directly in the rear of Springfield and commanding the approaches to Morristown. Finding it impossible to proceed further, they commenced a retreat, in which they suffered severely from the militia, who took advantage of every tree and fence which could furnish an ambush. Irritated at the unexpected and obstinate resistance made by the Jersey troops and yeomanry, the British began to burn the houses and pillage the property of the villagers at Connecticut Farms. In one of the houses was the family of Mr. Caldwell, whose wife had retired to a back room, with her 2 youngest children—one an infant in her arms—where she was engaged in prayer, when a musket was discharged through the window. Two balls struck her in the breast, and she fell dead upon the floor. The church was already in flames, and the parsonage was about to be set on fire when her corpse was discovered by a young American officer, in the British service, who succeeded in preventing the destruction of the building, and obtained permission from the commanding officer to remove the remains to a place of greater security. The odium which attached to the perpetration of this ruthless murder was so universally expressed, and its effect upon the popular mind was so injurious to the royalists, that they insisted it was the result of a chance shot from the cross firing of the contending parties, while the Americans declared it to be the deliberate act of a British soldier. There are, however, good reasons for believing it to be the deed of an Irishman who had been employed in the service of Mr. Caldwell, and who, for some reason, had conceived a violent enmity against his employer. Upon this occasion he joined the enemy and accompanied them on their retreat. Mr. Caldwell was on duty in Washington's camp, and, after passing a night of anxious uncertainty, he procured a flag on the following morning and went to Connecticut Farms, where his worst fears were at once confirmed.—On June 23, Gen. Knyphausen made a second incursion with about 5,000 troops. On this occasion he passed over the same route to Springfield, where a battle was fought. Though the enemy were defeated in the principal object of the expedition, they succeeded in burning the village. Among the most active in the fight was the chaplain Caldwell. There is a tradition, well authenticated, that in the hottest period of the action the wadding of a portion of the Jersey infantry gave out, which fact being communicated to Caldwell, he rode to the Presbyterian church, and hastily collecting the psalm and hymn books which were in the building, he distributed them to the soldiers with the exhortation, "Now put Watts into them, boys!" The British were finally compelled to retrace their steps, which they did with all possible rapidity, followed and harassed as

before by the Jersey militia.—In 1781 a commissariat of prisoners was established at Elizabethtown, and a small vessel with the privilege of a flag made weekly trips between that place and the British head-quarters at New York. On Nov. 24 Mr. Caldwell went to the Point, either for the purpose of receiving a lady who was expected as a passenger, or to execute a commission for her. Finding that the vessel had arrived, he went on board and soon returned with a small package, which he was carrying toward his chaise when he was hailed by James Morgan, the sentinel on duty, and ordered to deliver the package for examination. He replied that it was the property of a lady for whom it had been placed in his charge; and it appears that he was really ignorant of its contents, among which were the prohibited articles of tea, mustard, and pins. The order was repeated, when Mr. Caldwell turned away and was leaving the sentinel for the purpose, it is said, of returning the package to the vessel, when the soldier shot him dead upon the spot. In compliance with the popular demand the sentinel was delivered to the civil authorities, and was tried for the crime of murder at a court held in the Presbyterian meeting-house at Westfield, the township adjoining Elizabethtown. His defence upon the trial was that he committed the act in obedience to orders, and in the discharge of his duty as a sentinel. The plea was unavailing; he was condemned and hanged, Jan. 29, 1782. The remains of Mr. Caldwell and of his wife were interred in the graveyard of the first Presbyterian church in Elizabethtown, and a costly marble monument was dedicated to their memory by the citizens of that town, on the 64th anniversary of the death of the "soldier parson."

CALDWELL, JOSEPH, D. D., first president of the university of North Carolina, was born at Leamington, New Jersey, April 21, 1773, died at Chapel Hill, N. C., Jan. 27, 1835. He was educated at Princeton college, where, in 1791, he pronounced the salutatory Latin oration. From this period till 1796 he acted as tutor at Princeton, but then an event occurred which laid the foundation of his future distinction and usefulness. The humble tutor was chosen to fill the chair of principal professor at the infant university of North Carolina, and henceforward his destinies were bound up with those of that institution. Under his tutelage the new university grew and flourished, and in 1804, as a proof that his services and devotion were appreciated, he was made first president by the trustees. For nearly 40 years he remained in connection with the university, and his government of it during that long period excited the admiration of his contemporaries, and proved the source of its present prosperity. He it was who chiefly digested and arranged its educational systems, framed its constitution, and laid down rules of discipline for the control of its alumni. In 1824 Dr. Caldwell went to Europe to select books for the library, to

from cabinets, and to procure valuable philosophical apparatus. In 1828 he was attacked by a disease which filled his latter days with suffering, and which, after tormenting him for 7 years, ultimately carried him off. Though Dr. Caldwell's fame mostly arises from his connection with the university of North Carolina, yet his labors under the pseudonym of "Carlton," on railroads and internal improvements, demonstrate that he was not indifferent to the interests of the outside world. His most important literary work is an elementary "Treatise on Geometry," which appeared in 1822. Dr. Caldwell was an able mathematician and a professed theologian, but his favorite maxim was "*facta non verba*," and it is chiefly as a man of action in the capacity of tutelary guardian of the North Carolina university that he is known to us.

CALEDONIA, a mountainous but fertile county in the N. E. part of Vermont; area, 650 sq. m. The Connecticut river forms its S. E. boundary, and several small streams within its limits furnish water power for a number of saw and grist mills. Maple sugar is produced in this county in greater quantities than in almost any other in the United States. Potatoes, oats, and hay are the other staples. The productions in 1856 were 82,551 bushels of wheat, 90,599 of Indian corn, 215,795 of oats, 565,241 of potatoes, and 185,730 pounds of wool. There were 19 corn and flour mills, 100 saw mills, 15 woollen factories, 19 tanneries, 1 iron foundry, 3 newspaper offices, 40 churches, and 7,661 pupils attending public schools. There are some sulphur springs, and abundance of granite and limestone. Organized in 1792. Capital, Danville. Pop. in 1850, 29,095.

CALEDONIA is the name given by the Romans to the northern part of Scotland, beyond the Glota and Bodotria, the modern Clyde and Forth, which formed the boundaries of their province. It is mentioned in Tacitus, who believes its inhabitants, on account of their reddish hair and large limbs, to be a people from Germany. Agricola, the conqueror of Britain (78-85), was the first Roman general who came in contact with them; in the 6th year of his expedition, he penetrated with an army beyond the Bodotria, assisted by a coasting fleet; but the determined resistance of the barbarians, and the repulse of the 9th legion, attacked by night, compelled him to return. In the next year he came again, advanced as far as the Grampian hills, and rested 30,000 Caledonians, under Galgacus, their chief, which bloody victory has found a lively description in Tacitus's life of this hero. In the ensuing night the dying barbarians burned their rude dwellings and disappeared; and Agricola soon returned to the south of the river, and fortified their line for the defence of the Roman province. The emperors Hadrian, Antoninus, and Severus, strengthened the natural boundary with walls and ramparts against the frequent incursions of the Caledonian barbarians, afterward known under the name of

Picts and joined by Scots from Ireland. When the Romans, unable to defend Britain, left it to its fate, the inhabitants called the Anglo-Saxons (449) to their aid against their northern neighbors. The power of the Picts was broken (869) by the Scots, who gave their name to the country.

CALEDONIAN CANAL, in Scotland, connects the Inverness and Argyll, connects the North with the Irish sea, extending from Murray frith through Loch Ness, Oich, and Lochy, in the great glen of Caledonia, to Loch Eil. The total length is 69½ miles, of which the locks compose 37½. The canal was begun in 1806, and opened for navigation about the close of 1823. The government appropriations in this work between 1806 and 1847 amounted to over \$1,500,000.

CALEP, Rowmer, a merchant of Boston, died at Roxbury, April 18, 1719. He lived when the witchcraft delusion and persecutions were prevalent in Massachusetts, and was distinguished by his steady opposition to the proceedings of the magistrates and ministers. He wrote a book in answer to Cotton Mather's "Wonders of the Invisible World," which he entitled "More Wonders of the Invisible World," and which was issued from a London press in 1700. His book was denounced from the pulpit and in pamphlets, and was even publicly burned in the yard of Harvard college. Era long, however, the popular sentiment changed in this respect, and the opinions which Calep had upheld became prevalent.

CALEMBOURG, a French word for a pun, or a witticism, the origin of which is ascribed by the Germans to a Westphalian count of the name of Calenberg, who blundered whenever he attempted to speak French. According to other authorities, the term is derived from a factitious Persian apothecary whose name was Calenbourg.

CALENDAR is a method of numbering and arranging days, weeks, months, and years, or a mechanical contrivance for registering that arrangement. The day is a natural division of time varying slightly in its length, but so slightly that a clock keeping mean or average time seldom differs 15 minutes from the time as given by the sun. Civilized nations usually commence the day at midnight, and count 24 periods of 15 hours each in the day. Astronomers and navigators since the time of Ptolemy commence the day at noon, and number the hours from 1 to 24.—The week is not a natural division of time, although 4 weeks are nearly a lunation, and many periods in the animal economy, such as the incubation of eggs, correspond singularly with weeks. The use of the week in eastern nations from time immemorial is by some ascribed to the effect of divine command, as recorded by Moses, and by others to the number of conspicuous planets. Our common names for the days of the week are Saxon in form, but evidently were borrowed originally from some eastern nation, as the gods to whom

each day is consecrated correspond in character to those to whom the days were consecrated by the Greeks and Latins, when they adopted the week from the East. The Greeks and Romans originally had no weeks.—The Greeks divided the month into 3 equal decades, the Romans into 3 very unequal periods. The length of the month was suggested, as the word shows, by the moon, which completes her changes in about 30 days. But inasmuch as the solar year does not consist of an even number of lunar months, the months have in most nations become fixed periods of 30 or 31 days. The length of the months in most civilized nations has been copied from the Romans. No nation has, however, followed the singular division which the Romans made in the month by means of 8 days. The first day being called the calends, and the 13th or 15th the ides, the nones were the 9th day before the ides, and the other days of the month were numbered from the next succeeding calends, nones, or ides. The day, for instance, which we call Feb. 19, they called the 11th before the calends of March.—The solar year is a natural period, formerly measured by the interval between 2 successive vernal equinoxes. If the civil year corresponds with the solar, the seasons of the year will always come at the same period. But in early times the Roman pontiffs regulated the length of the civil year so imperfectly, that in the days of Julius Cæsar the spring occurred in what the calendar called summer. Cæsar, with the help of Sosigenes, reformed the calendar in 46 B. C., and introduced our present arrangement of having 3 years of 365 days followed by one of 366, dividing the year into months nearly as at present. The irregularity of alternation in the months of 30 and 31 days was introduced a few years after to gratify the vanity of Augustus, giving his month of August as many days as Julius Cæsar's month of July. The additional day was given in leap year to February, by calling the 6th day before the calends of March a second 6th; whence leap year is still called in the almanacs bissextile year. This calendar of Julius Cæsar is still used in the Russian empire, and was in use in all Europe until 1582. Its error consists in making the year 365½ days, which is about 11 minutes too much, an error which has now amounted to about 12 days. Pope Gregory XIII. by a brief ordered Oct. 5, 1582, to be called the 15th, and that the years 1700, 1800, and 1900 should not be accounted leap years. This is called the Gregorian calendar.—The most intricate matter in the calendar is the ecclesiastical rule governing the movable feasts. The council of Nice ordained in the year 325 that Easter should be celebrated on the 1st Sunday after the full moon that occurs on or next after the day of the vernal equinox. The days of the week are denoted by the 7 leading letters of the alphabet, A being placed against Jan. 1. The dominical letter for the year is the letter which will then come against Sunday. The solar cycle is a period which re-

stores the 1st day of the year to the same day of the week, by means of which we can of course find the dominical letter for any year, and therefore tell what day of the week it was or will be at any given date. The lunar cycle is a period which restores the new moon to the same day of the month. The golden number indicates the place of any given year in the lunar cycle, so that by means of it we can tell on what day of March the full moon falls, and thus find Easter day. The Gregorian calendar, civil and ecclesiastical, was soon adopted in the Catholic states. In the Protestant states of Germany it was but partially adopted in 1700, and not wholly until 1774. The change from Julian to Gregorian reckoning was made by act of parliament in Great Britain, Sept. 1752, the 3d of the month being called the 14th.—The ancient Egyptians, Chaldeans, Persians, Syrians, Phœnicians, and Carthaginians, each began their year at the autumnal equinox (about Sept. 22). The Jews also began their civil year at that time, but in their ecclesiastical reckoning the year dated from the vernal equinox (about March 22). The beginning of the year among the Greeks was at the winter solstice (about Dec. 22) before the time of Meton, and at the summer solstice (about June 22), after Meton. The Greek astronomers had a solar year peculiar to themselves, to the months of which they gave the 12 signs of the zodiac. The Roman year from the time of Numa began at the winter solstice. It was not probably the original purpose of Cæsar to change this time of the commencement of the year, and his motive for delaying it several days till Jan. 1 was, doubtless, the desire to make the first year of the reformed calendar begin with the day of the new moon. Among the Latin Christian nations there were 7 different dates for the commencement of the year: March 1; Jan. 1; Dec. 25; March 25 (beginning the year more than 9 months sooner than we do, this was called the Pisan calculation, and though unknown in Spain, England, and Germany, was followed in several states till 1745); March 25 (beginning the year nearly 8 months later than we do; this was called the Florentine calculation, and was much in use from the 10th century till 1745); at Easter; and on Jan. 1. (but one year in advance of us). In France the year began in general at March 1, under the Merovingians; at Dec. 25, under the Carolingians; and at Easter, under the Capetians. By edict of Charles IX., in 1564, the beginning of the year was ordered at Jan. 1. In England, from the 14th century till the change of style in 1752, the legal and ecclesiastical year began at March 25, though it was not uncommon in writing to reckon it from Jan. 1. After the change was adopted in 1752, events which had occurred in Jan., Feb., and before March 25, of the old legal year, would, according to the new arrangement, be reckoned in the next subsequent year. Thus the revolution of 1688 occurred in Feb. of that legal year, or, as we should now say, in Feb.

1699, and it was at one time customary to write the date thus: Febr. 1699.—The year of the French revolutionary calendar, which was instituted in 1792, began with Sept. 22. It consisted of 12 months of 30 days each, with 5 sacred days at the end devoted to festivals, and called the *sansculottides*. The months were divided into 3 decades of 10 days each. Every period of 4 years was termed a *francade*, and was terminated by 4 instead of 5 festival days. The more accurate adjustment was arranged according to the Gregorian regulation for leap year. The Gregorian calendar was restored in France, Jan. 1, 1806.—The ancient northern nations of Europe began their year from the winter solstice. In the era of Constantinople, which was in use in the Byzantine empire, and in Russia till the time of Peter the Great, the civil year began with Sept. 1, and the ecclesiastical sometimes with March 21, and sometimes with April 1. The beginning of the Mohammedan year is not at any fixed time, but retrogrades through the different seasons of the solar year. Among most of the peoples of the East Indies, the year is lunar, and begins with the first quarter of the moon the nearest to the beginning of December.—Among the Peruvians the year began at the winter solstice, and among the Mexicans at the vernal equinox. The year of the former was lunar, and was divided into 4 equal parts, bearing the names of their 4 principal festivals, instituted in honor of their 4 divinities allegorical of the seasons. The Mexicans had a year of 360 days and 5 supplementary days. They divided it into 18 months of 20 days, and had a leap year.

CALENDERING, the process of finishing cotton and linen goods by passing the cloth between smooth cylinders, which are made to revolve in contact. The term is also applied to the subsequent operations of cloth-lapping, or folding the cloth, and packing it, all which are conducted in the same establishment. The business also connected with the shipment of the goods is all considered a part of that of the calender houses. Paper as well as cloth is subjected to the finishing process of calendering, as will be described in the article *PAPER*. The name calender is applied to the machine comprising the rollers which smooth the woven fabrics. Before passing the cloth between them, it is essential that such as is designed for calico printing should be subjected to the singeing process, in order to remove the loose fibres or down; and it is common to subject most goods to this operation. It consists in drawing the cloth rapidly over a horizontal gas-pipe, along which numerous little apertures extend in a straight line, so that the gas, ignited, gives a long line of flame equal in the width of the cloth. Another pipe, placed over this and exhausted of air, draws in the flame through the goods as they pass between the two pipes, and the loose fibres are burned out without igniting the fabric. The movement is at the rate of about 3 feet in a second. Any spots that may remain are

extinguished as the cloth immediately passes between 2 rollers placed in front of the line of flame. A yellow color like that of muslin is produced by this process, which requires to be removed by bleaching, before printing.—As the goods are received by the calenderer, they are commonly first dampened, sometimes by passing them over the surface of water. The folds and creases are then partially removed, and the cloth is better prepared for the succeeding operations. The smoothing and polishing by the calender is similar in effect to the operation of the domestic smoothing iron, or, on a larger scale, of the mangle; but, applied to the enormous quantities of cloth turned out by the cotton and linen mills, it must be conducted with most efficient machinery. The objects to be attained are, rendering the surface of the fabric smooth and even by the removal of all wrinkles, the flattening down of all knots and other imperfections, and the spreading of the threads so as to give them a flattened form, and the texture the appearance of closeness and strength. The polish upon cotton goods called glazing, is produced by the friction they receive in this process. Calendering varies with the nature of the fabric and the purposes for which it is designed. Lawns and muslins of light texture are smoothed in light machines not heated, and with moderate pressure, there being no objection to their threads retaining the cylindrical form, and the fabric its open texture. On the other hand, the fabrics, which are to go to the calico-printer to receive the first impression by the block, require a high pressure, and sometimes to be passed twice through the rollers. But those which have already been partially colored, and are to be filled in with other colors, must not receive that stiffness of finish which will prevent the cloth being stretched one way or the other, whenever it may require slight changes of form, to admit of the exact adjustment of the grounding blocks to the outline of the colors already applied.—The smoothing calender was introduced into Great Britain from Flanders and Holland during the persecution of the Huguenots. It has been improved in Lancashire by substituting rollers made of pasteboard disks for 3 of the 5 commonly employed in the machine, which 2 were previously constructed of wood, and were consequently liable to warp and crack with the heat to which they were exposed. The other 3 are hollow cylinders of cast-iron, constructed of metal 2 inches thick surrounding the internal cavity of 4 inches diameter; this gives them a diameter of 6 inches. The cavity admits of the introduction of a red-hot roller or of steam. The pasteboard cylinders suitable for the iron ones of the dimensions given are 2 of 20 inches diameter, and 1 of 14 inches. They are placed in a strong upright iron frame, the small cylinder in the middle and an iron one above and below it, revolving as a cylindrical smoothing iron between the 2 pasteboard cylinders which take the place

of the domestic ironing board or table with its cover of cloth. The paper rollers are very ingeniously contrived to avoid the defects of the wooden ones, and present a smooth surface to the cloth. Set like a wheel upon its axle, a disk of cast-iron at the end of a strong iron bar is perforated with 6 holes near its circumference for as many iron rods to pass through. Circular plates of thick pasteboard, an inch larger in diameter than the intended roller, are next laid upon this disk; they are furnished with holes for the axle and the iron rods. The pile is continued to a length as much exceeding that intended for the roller as the pasteboard disks will shrink by the compression they will be subjected to. A corresponding iron plate is then set upon the other end of the axle, and the rods being passed through and screwed up, the cylinder thus formed is put in a hot apartment or stove to be thoroughly dried for several days, the screws being occasionally tightened upon the rods as the pasteboard shrinks. The surface of the cylinder thus obtained is excessively hard and close. To turn it down to its proper size is a work of great labor; several men are employed upon it, and the best tools are rapidly dulled. They are necessarily of small size, slowly working down the face of the cylinder, as it revolves at the rate of only 40 or 50 revolutions per minute. When finished, it presents a hardness and polish far superior to that of wood; it also possesses great strength, without the liability of being warped or injured by the great heat to which it is to be exposed. When set in the frame, they are so arranged that they may be forced by levers or screws into very close contact with the iron cylinders. The cloth, fed from a roll placed opposite the machine, is carried over the upper pasteboard cylinder, between this and the iron one, then between this and the next below, and so on till it has been 4 times compressed and ironed. The glazing or polishing of the surface is produced by the middle pasteboard cylinder being made to revolve more slowly than the others, and consequently producing a rubbing effect of the cylinders upon the cloth. By this arrangement the former tedious operation of glazing upon a table is rendered unnecessary. A calender, contrived by Mr. Dollfus, has cylinders of sufficient length to pass through 2 pieces of cloth at once, and it is also provided with a folding machine, which receives the cloth as it comes out of the rollers, and folds it without the attention of the workmen. By running through 2 layers of cloth together, one upon the other, the threads of one make an impression upon the other, giving a wiry appearance to the surface. The embossed appearance is produced by rollers of copper, upon the face of which the design is engraved. The proper folding of the cloth preparatory to its being pressed, must, like the other operations of calendering, be carefully conducted, that the appearance of the finished article shall be perfectly neat and free from creases and blemishes of every kind.

Particular importance is attached to the method of doing this, the object being sometimes to make the articles appear what they are not, and sometimes to make their real character conspicuous. When the folds are completed, usually with muslin goods so as to admit of their being opened in any place, like the leaves of a book, the pieces are placed, with thin boards and glazed pasteboard between each, in a powerful hydraulic press, capable of exerting a pressure of 400 tons. While in the press the parcels are corded and prepared for packing immediately in bales. The measure of the cloth has been taken before the folding, either upon the long measuring table, or by folding the cloth from one side to the other and back upon a graduated hooking frame, provided with 2 needles upon which each fold is suspended. The labels for the cloth put up at the English calendering establishments, are expressly designed for the particular country to which the goods are to be sent. Most of them are of showy pattern in blue and gold, with various devices. Some of the more expensive cost \$5 or \$6 per 100, while the common labels are worth only 25 cts. per 1,000.

CALENDS, the first day of the month in the Latin calendar.

CALENTURE, or INDIAN SUN-STROKE, a violent fever incident to persons in hot climates, especially to such as are natives of more temperate regions. This inflammatory fever is attended with delirium, during which the patient is often tempted to walk into the sea, imagining the extensive surface of the ocean to be an immense plain of pleasant and refreshingly cool green fields.

CALENZIO, or CALENTIUS, ELISEO, a Neapolitan poet of the 15th century, died in 1503, published numerous writings in prose and verse, elegies, epigrams, satires, fables, and epistles, which were issued under the title of *Opuscula*. He also wrote upon penal legislation, and is said to have been the first to propose the restriction of capital punishment to the crime of murder.

CALEPIN, a French name for a collector, of notes and extracts, or a commonplace book. It is derived from AMBROSIO CALEPINO, an Italian, who published in 1502 a Latin-Italian lexicon, which had in its time a great reputation and passed through many editions, especially in Switzerland, where it was enormously increased by notes and by the introduction of additional languages. The edition of Basel, 1590-1627, is in 11 languages.

CALF, the young of a cow, or of the bovine genus of quadrupeds. Whatever breed the calf may spring from, its natural food is milk; coming from the mother in a warm state, it is exactly adapted to the existing condition of her offspring. Milk contains materials for making bone, as phosphoric acid, lime, soda, &c.; for muscle, caseine; for fat, butter or oil, and sugar of milk, as well as a large percentage of water. The method pointed out by nature is pursued

by some breeders; the calf is allowed to run with the dam till weaned; but in most instances this is considered unprofitable, particularly where the object is to secure the largest supply of milk and its products for sale. Thousands of calves are annually slaughtered at 2 and 3 days old, when the milk of the cow is considered fit for use; the meat fed to swine or fowls, the skin sold to the tanner. This wholesale slaughter at so early an age might be avoided by very simple means, and a large increase added to the dairyman's revenue, while the market would be supplied with more good veal and beef, and a greater number of cows would be produced. Some dairymen have selected 2 or more cows from their herd for the rearing of calves, the latter being removed from their dams when 2 or 3 days old, and placed in the pen with the foster-mother. Two cows, bearing at different periods, have fattened 7 calves in one season, and finished the year by becoming virtuous themselves to the butcher. It is necessary that the foster-dam have clean, well ventilated quarters, and the best quality of succulent food; in summer, sweet hay, clover, green corn, or rye grass, cut and carried to her, with an occasional feed of corn or oil meal if she and her family are not in a thriving condition. In winter the food should consist of the sweetest of hay, at least one peck of sliced roots, morning and evening, with meal and a little salt sprinkled over them. When an increase of milk is desired, additional quantities of roots or mashes made from meal, or shorts scalded and made thin with water, should be fed. In Scotland, "the cows intended for nursing generally calve early in the season, about the month of January or February, when a strange calf is procured from some of the small tenants in the district who have dairies. This calf is suckled with the other by the same cow, and although the cow at first shows great dislike to the stranger, in a few days she receives it very quietly, care being taken that both are put to each (one on each side) exactly at the same time, by tying the calves' hands to the stall, or to the band of the cow, so as to keep each calf at its own side. They remain with the cow 15 or 20 minutes, by which time her milk is perfectly drawn away. As the calves advance in age, they eat hay, sliced potato, porridge, and other food they are inclined to take. By May 1, or as soon as grass is ready, they are weaned and turned out from the byre, when 2 fresh calves are immediately put into their stalls, and receive the same treatment, excepting that they are turned out at 12 o'clock, after they have got their suck, to eat grass, and are brought into the byre again at evening, when the cows come in to be suckled. This set is ready to be weaned by August 1, and a single calf is put into the feeding pen, and the calf fattened for the butcher, the season being now too late for rearing. As these are fed off, the cows are let off milk, having each suckled 2 calves. It is necessary to have a very steady

and careful person to attend to the suckling, which has to be done 3 times a day, viz.: early in the morning before the cows are turned out to grass, at mid-day, and in the evening when the cows come into the byre for the night, and get a little cut grass, taro, or other green food. The byre is arranged so that each of the cows has a stall about 4 feet wide, with their heads to the wall; and on the opposite wall the calves are tied up, 2 in a stall, exactly behind the cow, so that there is little trouble in putting them to the cow, and no chance of displacing them. The fat calves have in some seasons been sold at £3 each, this being the scarsest time of year for veal." In the natural state, the cow yields milk enough to rear the calf, then ceases to give milk until the next calving. Man has bred cows for milking qualities; hence the length of time for giving milk, and the quantity given, are both greater than required for the calf; hence two evils arise: the calf, if left with the cow, is overfed; and her milking qualities are injured. For these reasons the calf should be nursed by a cow kept specially for that purpose, or reared by hand. Robert Colt, Pittsfield, Mass., says: "Take the calves from the cow, and feed them with 3 quarts of new milk twice a day for 3 months, adding, after they are 3 weeks old, a little rye and corn meal scalded, then wash off upon dry provender and grass, roots, or hay, as the season may be." Or, "Take the calf directly from the cow, put some dry flax seed in its mouth, and feed on flaxseed jelly and hay tea for 1 or 2 months, till the calf is able to eat grass. The jelly is made by boiling 1 pint of flaxseed in a gallon of water; pour boiling water over sweet hay and extract its good qualities; the 2 are then mixed together, about 1 pint of jelly being used to 2 gallons of hay tea per day, with an occasional addition of oil meal." This will do in the absence of milk, but cannot be highly recommended. Feeding on sour milk has been tried, and heaves have been produced at 1 year old of 500 lbs. Calves, when taken from cows, are usually fed with skim milk, being allowed to suck the fingers immersed in the milk until the habit of drinking is established. The milk must be given blood-warm, and may be enriched by boiled potatoes mashed, or this mash from Indian corn meal. About 16 to 20 pints per day is the usual quantity of milk. Cold milk is apt to purge the calf; if this occur, the use of 1 or 2 spoonfuls of rosenet will remove the difficulty. Never overfeed a calf, or it will become pot-bellied, and permanently injured. As soon as frore occurs, pen the calves, and give sweet hay with a few sliced carrots or other roots, with a little salt. To prove profitable, a calf must show daily improvement, and never suffer the least check in growth. In the Isle of Jersey no calves feed from the cow. Mr. Moss, of Conn., has invented a pail with a simple gutta serena test at the bottom. The pail is filled with liquid food, and suspended in the stall above the calf, which feeds from it as from its dam.—DUNBAR: Vermis, a tablespoon-

ful of sulphur 8 mornings in succession; *Diar-
rhoea*, a little chalk, opium, and gentle cordials;
Constipation, castor oil, with a little ginger. For
treatment of diseases, see Youatt and Martin
on cattle.

CALHOUN, the name of counties in several
of the United States. I. A western county of
Florida, bordering on the gulf of Mexico, and
washed by the Appalachicola river on the E.;
area, 464 sq. m. It has a low surface, and
produces cotton, sugar, tobacco, and corn. The
productions in 1850 were 187 bales of cotton,
29,495 bushels of Indian corn, 80,252 lbs. of to-
bacco, and 2,570 of rice. There were 8 grist
mills, 2 saw mills, 1 church, and 44 pupils at-
tending public schools. Named in honor of
John O. Calhoun. Pop. in 1850, 1,377, of whom
458 were slaves. Capital, St. Joseph. II. A
central county of Mississippi, formed within a
few years from Chickasaw, Lafayette, and
Yallobusha, and drained by Yallobusha and
Loosascoona rivers. It is not included in the
last census. III. A southern county
of Texas, with an area of 494 sq. m., bound-
ed S. W. by Guadalupe river, and border-
ing on the gulf of Mexico. The bays of
Matagorda and Lavaca indent its N. E. coast.
The surface is generally level. Cotton, Indian
corn, and sweet potatoes are the staple produc-
tions. The soil is not fertile, and timber is
sparsely distributed over about $\frac{1}{2}$ of the surface.
In 1857 the county contained 801 horses, valued
at \$17,500, and 17,833 head of cattle, valued at
\$107,120. Value of real estate, \$416,720. Trav-
ersed by the San Antonio and Mexican Gulf
railroad. Capital, Indianola. Pop. in 1856,
2,114. IV. A southern county of Arkansas,
bounded S. W. by the Washita river, here navi-
gable by steamboats, E. by Moro river, and
having an area of about 600 sq. m. It has a
level or rolling surface, and a good soil suitable
for cotton and grain. The productions in 1854
were 86,185 bushels of Indian corn, 8,420 of
oats, and 2,126 bales of cotton. Capital, Hamp-
ton. Pop. in 1854, 2,351, of whom 624 were
slaves. V. A southern county of Michigan,
drained by St. Joseph's river and the head
waters of the Kalamazoo, and having an area
of 720 sq. m. It has a rich soil and an undu-
lating surface, mostly occupied by a scattered
growth of white and burr oak. Sandstone and
water power are abundant. The staples are
grain, hay, and wool, and the productions in
1850 were 385,959 bushels of wheat, 327,544 of
Indian corn, 18,779 tons of hay, and 126,991
lbs. of wool. There were 10 corn and flour
mills, 8 saw mills, 4 iron founderies, 3 woollen
factories, 2 newspaper offices, 18 churches, and
5,864 pupils attending public schools. The
Michigan central railroad passes through the
county. Organized in 1833. Capital, Marshall.
Pop. in 1850, 19,162. VI. A western county
of Illinois, occupying a narrow strip of land be-
tween the Mississippi and Illinois rivers, the
former of which separates it from Missouri, and
is joined by the latter at the S. E. border of the

county. Near the river banks the surface is
low and frequently inundated; in other locali-
ties are high bluffs and table land broken by
ravines. In the W. part are valuable coal fields.
The staples are grain, hay, beef, and pork, and
the productions in 1850 were 146,205 bushels of
Indian corn, 3,370 of wheat, and 163 tons of
hay. There were 8 grist mills, 2 churches, and
196 pupils attending public schools. Capital,
Hardin. Pop. in 1855, 3,768.

CALHOUN, JOHN CALDWELL, an American
statesman, born in the Calhoun settlement, dis-
trict of Abbeville, S. C., March 18, 1782, died
at Washington, March 31, 1850. On both
father's and mother's side he was of Irish
Presbyterian descent. His grandfather, James
Calhoun, emigrated from Donegal, Ireland, to
Pennsylvania, when his father, Patrick, was
only 6 years old. This was in 1738. The
Calhoun family, following the tide of emi-
gration then setting southward along the Alle-
ghanies, moved to the banks of the Kanawha,
in what is now Wythe co., Va. The incursions
of the Indians, consequent upon Braddock's de-
feat, compelled them to a new emigration, and
again moving southward, they established in
1756 the Calhoun settlement, so called, in the
upper part of South Carolina, near the Sa-
vannah river, in what is now Abbeville dis-
trict. They were pioneer settlers upon the
Cherokee frontier, and were engaged in fre-
quent conflicts with the Indians, in which Pat-
rick Calhoun took a leading part. When the
revolution broke out, he became an active
whig, and was exposed to great personal danger
from the numerous Tories of the neighborhood.
In 1770 Patrick Calhoun married Martha Cald-
well, born in Virginia, but the daughter
of an Irish Presbyterian emigrant. John O.
Calhoun, the third son of his parents, was
born just at the close of the revolutionary
struggle. He showed himself from early boy-
hood grave and thoughtful, ardent and perse-
vering. In that remote and thinly peopled
region it was chiefly household instruction that
he received. He was early taught to read the
Bible, and his parents strove, though with
slight success, to impress upon his youthful
mind their own strongly Calvinistic views.
At the age of 18 he took to reading history
and metaphysics with such application as to
impair his health. His father died not long
after, leaving the family in but moderate cir-
cumstances. He continued to reside with his
widowed mother, laboring on the farm, and
though most anxious for an education deter-
mined not to attempt to obtain it till sure of
the means without impairing her comforts.
In his 19th year, by the persuasion of a
brother, he recommenced his studies with a
view to the profession of the law, not however
till he had arranged with that brother and
mother to be furnished with means to pursue
them for 7 years. He declared his preference
for the life of a plain planter over that of a half-
educated professional man. In June, 1800, he

entered the private academy of his brother-in-law, Dr. Wadwell, a Presbyterian clergyman, where he prosecuted his studies with such zeal that after 2 years he was able to join the junior class of Yale college. He graduated in 1804 with the highest distinction. Dr. Dwight, the distinguished theologian, then president of the college, remarked, after a discussion with him on the origin of political power: "That young man has talent enough to be president of the United States." The next 3 years he devoted to the study of the law, 16 months of it in the law school at Litchfield, Conn.; then the only institution of the kind in the country. In addition to the regular course of study, he cultivated with great success his talent for extempore speaking. He returned to his native district of Abbeville to complete his studies, and being admitted to the bar established himself in the old homestead and commenced practice. Already he had made himself known. The country at that time was greatly agitated by the aggressions which France and England, in their desperate struggle against each other, were led to commit on neutral commerce. The controversy with England was rendered still more bitter by her claims to visit American ships in search of British seamen. The outrage upon the American frigate *Chesapeake*, committed under this pretext, in June, 1807, had called forth a burst of indignation. In Abbeville, as elsewhere, a public meeting was held to express the feelings of the people. Mr. Calhoun, then a student, was appointed to draw up a report and resolutions. These resolutions he supported in a speech which led to his election soon after to the state legislature. He served, however, only 2 sessions, but so much to the public satisfaction that he was chosen to represent his district in the 12th congress of the U. S. In May, 1811, he married his 2d cousin, Floride Calhoun, with whom he received considerable property. Upon his marriage he removed from the old homestead to Bath, on the Savannah river, a few miles distant. He appears from this time to have abandoned his profession, notwithstanding his good success in it thus far, and his special gifts for it.—He took his seat in congress Nov. 4, 1811, that body having been called together by the president's proclamation a month before the regular day of meeting. The conference was a most important one. The struggle which had been going on for the 3 or 4 years previous in the ranks of the administration party, between those inclined still to promote peace and those in favor of war against Great Britain, was just approaching a crisis. In the election of members of the new congress the war party had gained a complete triumph. They had won into the house of representatives a number of ardent young men, of whom Mr. Calhoun was one, determined to force the administration into the adoption of the war policy. The election of speaker resulted in the choice of the candidate of the war party by a very decided majority over

both the peace and cabinet candidate. Mr. Calhoun was placed on the committee of foreign relations. A report from that committee, speedily submitted, and understood to be drawn by him, distinctly indicated the policy which the majority were determined to pursue. The time had come, as the report asserted, for choosing between two submissions and rescues by all the means which God had placed within the nation's reach. By the retirement of the chairman of the committee of foreign relations, Mr. Calhoun became the head of that committee, and in that character introduced a bill for an embargo of 90 days, as preliminary to a declaration of war. President Madison having been compelled to send in a message recommending a declaration of war, Mr. Calhoun reduced that recommendation in a report from his committee, and followed it up by a bill declaring war against Great Britain. In his report at the next session from the committee of foreign relations, to which had been referred the papers in reference to a suspension of hostilities, Mr. Calhoun warmly justified the administration in proceeding with the war, notwithstanding the result of the British orders in council, on the question of impressment alone. He had joined with his colleagues, Chiles and Lowndes, both young men like himself, and the former chairman of the naval committee, in urging, among other preparations for war, an enlargement of the navy. He also took decided ground against the whole system of non-importation and non-intercourse, which had been another favorite measure of the democratic party, and assisted by his votes and speeches in getting rid of what remained of it. The action of these young South Carolinians attracted attention in New England, and the idea presently began to be entertained there of a coalition with South Carolina to put down the Virginia dynasty, and what in New England was denounced as its narrow and anti-commercial policy.—This feeling was a good deal strengthened by what happened afterward in relation to a national bank. The growing financial distress of the government had led, early in 1814, to the suggestion of such an institution. It was reported against by Epes, Mr. Jefferson's son-in-law, and chairman of the committee of ways and means, as unconstitutional. This objection Mr. Calhoun proposed to evade by limiting the charter to the district of Columbia, but it was not thought by the treasury department that such a bank would answer the purpose. At the next session Alexander J. Dallas, lately appointed secretary of the treasury, proposed a national bank with a capital of \$50,000,000, \$5,000,000 in specie, the rest in government stocks; the government to subscribe $\frac{1}{2}$ of the capital, and to have the appointment of the president and $\frac{1}{2}$ of the directors, with power, also, to authorize a suspension of specie payments; the bank to be obliged to lend the government \$30,000,000, and not to be required to pay specie during the war or for 2

years after. This scheme was warmly opposed by Mr. Calhoun, who proposed to furnish the government with \$45,000,000 by means of a national specie-paying bank, wholly under private control, and not obliged to lend the government any thing. The capital of this bank was to consist of \$5,000,000 of specie and \$45,000,000 of new treasury notes, which it was proposed to get into circulation by making them convertible into bank stock. This project prevailed in the house by a large majority. But Dallas in a labored report denied that new treasury notes to any considerable amount could thus be disposed of. He dwelt also on the injustice and political danger of a scheme which might enable those federal capitalists who had hitherto held back and refused to lend their money to the government to obtain, to the exclusion of the holders of the existing government stocks, the control of a national bank with a capital 5 times as large as the old bank which the administration party had refused to recharter. These considerations staggered a part of the democratic supporters of the bill, and the federalists, who had supported Mr. Calhoun's scheme as against Dallas's, now joining with Mr. Dallas, Mr. Calhoun's bill fell to the ground. Thereupon Dallas's scheme was renewed in the senate, where a bill was speedily passed for a non-specie-paying bank on his plan. When this bill came down to the house it was vehemently opposed by Mr. Calhoun, and after a very hot debate was defeated by the casting vote of his colleague, Obeyes, who, since Mr. Clay's departure as commissioner to Ghent, had been chosen speaker. A compromise scheme was then adopted for a bank with \$80,000,000 of capital, \$5,000,000 in specie, \$10,000,000 in stocks created since the war began, and \$15,000,000 in new treasury notes. But the great points of Mr. Calhoun's scheme were still preserved: the bank was not obliged to lend to the government, nor permitted to suspend specie payments. The senate wished to substitute the main point of Dallas's plan by vesting a power in the president to authorize a suspension, but the house refused to agree to this, and the bill having quickly passed without any such provision, it was vetoed by President Madison as inadequate to the emergency. The peace which speedily and unexpectedly followed, attended as it was by great importations of foreign goods, paying the double duties imposed during the war, relieved the immediate wants of the treasury. But both the government and the country were still subjected to great embarrassments by the unequal value and depreciated state of the currency, growing out of the continual suspension of specie payments by the banks south and west of New England. To remedy this evil, the project of a United States bank, which all now agreed should be specie-paying, was revived in the 14th congress, resulting in the charter of the late bank of the United States. The conduct of this project through the house was intrusted to Mr. Calhoun. He

was chairman of the committee by which the bill was reported, and he asserted in after years, and doubtless with truth, that but for his efforts the bank would not have been chartered. He also supported the tariff of 1816, designed to give to the domestic manufactures which the commercial restrictions, the war, and double duties had called into existence, some safeguard against foreign competition.—Another topic now first prominently introduced into congressional discussion, was that of internal improvements, of which the necessity had been shown by the cost and difficulty of transportation during the war. The president, in his annual message, had suggested such roads and canals as could best be executed under the national authority "as objects of a wise and enlarged patriotism." He referred, indeed, to the objection of a want of express constitutional authority, but suggested that any obstacle from that source might easily be removed. This idea was warmly taken up by Mr. Calhoun, and at the next session of congress, by great exertions, he succeeded in carrying through the house, by the close vote of 86 to 84, a bill appropriating the bonus of a million and a half to be paid by the United States bank, also all dividends upon the seven millions of stock held by the government in that institution, as a fund for internal improvements; each state to be entitled to a share in the expenditure proportioned to its representation in congress, but to be authorized also to consent to the expenditure of its share in any other state. This bill passed the senate, 20 to 15, but, to Mr. Calhoun's great surprise and mortification, was cut short by the veto of the president, on the ground of want of constitutional power in congress to make such appropriations. This occurred just at the close of Madison's term of office (March, 1817), which also brought to a close Mr. Calhoun's very active 6 years' term of service in the house of representatives. Before the next congress met, he was called to take a place in President Monroe's cabinet as secretary of war. He now removed his family to Washington, and resided there permanently for the next 7 years. In the first congress after Monroe's accession, the house resolved, 90 to 75, that congress was empowered to appropriate money for the construction of post roads, military and other roads, and of canals, and for the improvement of water courses; and the secretaries of war and the treasury were directed to report at the next session a list of internal improvements in progress, and a plan for appropriations to aid them. The friends of the resolutions looked up to Mr. Calhoun as their champion in the cabinet against Mr. Crawford, the secretary of the treasury, who denied any constitutional authority for such appropriations of the public money.—Mr. Calhoun found the war department in a greatly disorganized condition, with some \$50,000,000 of outstanding and unsettled accounts, and the greatest confusion in every branch of service. He took means for the speedy settlement of these claims, and drew up

a bill for reorganizing the staff of the army. This bill congress enacted into a law, which still remains in force. Shortly after Mr. Calhoun's appointment as secretary of war, Gen. Jackson, retained on the peace establishment as one of the two major-generals, and appointed to the command of the southern department, was sent to take the lead in person of the forces operating against the Seminole Indians. The orders under which he acted were drawn by Mr. Calhoun. Gen. Jackson interpreted these orders to give him discretionary authority to do as he pleased, and acting also, as he afterward alleged, upon a private intimation of the wishes of the administration, that he should take possession of Florida (though over this there hangs an unexplained mystery), he not only followed the Seminoles into Florida, but seized first upon St. Mark's, and then upon Pensacola. The Spanish minister protested against this violation of the Spanish territory. Mr. Calhoun, in a cabinet council held upon the subject, considering that Gen. Jackson had violated his orders, maintained the expediency of bringing him to trial for it. This was warmly opposed by J. Q. Adams, secretary of state, whose opinion prevailed with the president. The conduct of Gen. Jackson in his Florida campaign became a subject of vehement discussion in congress, and a matter of great sensibility to the general himself. What passed in the cabinet he had at that time no authentic means of knowing, but from an extract of a letter which appeared in a Nashville newspaper, he was led to suppose that while Mr. Crawford, the secretary of the treasury, had attacked his conduct, Mr. Calhoun had joined with Mr. Adams in vindicating it. Ten or 11 years after, as we shall see, his discovery of what had really occurred had a serious influence, not only on Mr. Calhoun's personal relations to the general, then president of the United States, but on his political position and prospects. The question of the signature by the president of the Missouri compromise bill being brought before the cabinet, Mr. Calhoun held the bill to be constitutional, on the ground of a power in congress to prohibit slavery in the territories of the United States, though he was of opinion that such prohibition would remain in force only while the territorial condition lasted, and would not be binding upon any state which might be created out of such territory.—Shortly after the commencement of President Monroe's second term of office in 1817, the question of the succession became one of leading interest. Mr. Calhoun's name was mentioned among others. He was regarded, especially in Pennsylvania, as a statesman of broad views, above mere local or narrow party influences, and disposed, on the question of internal improvements and other questions of national importance, to a liberal construction of the power of the general government. Mr. Crawford was also a candidate for the presidency, and the favorite of the Virginia politicians. But the military exploits of

Gen. Jackson, also brought forward as a candidate, made such an impression on the popular mind in Pennsylvania, that the friends of Mr. Calhoun judged it expedient for them to withdraw his name and to support Jackson instead. Thereupon Mr. Calhoun ceased to be a candidate for the presidency, and contented himself with standing for the vice-presidency. As between the presidential candidates, he assumed a position of neutrality, and as the ability with which he filled the office of secretary of war was generally admitted, he obtained nearly the whole of the Adams and Jackson votes, with some of those for Mr. Clay, and was thus elected by a large majority. Upon giving up his office as secretary of war, he removed his family to Pendleton, now Pickens district, in the extreme northern angle of South Carolina, to an estate called Fort Hill, which had descended to Mrs. Calhoun from her mother, and which continued to be his residence for the rest of his life. Immediately after the choice of Mr. Adams by the house of representatives, through the support of Mr. Clay, a coalition was entered into between the supporters of Jackson and Crawford to oppose the administration of Mr. Adams, and when the election drew near, to support Jackson as his successor. Into this combination Mr. Calhoun, though he had been supposed to prefer Adams to Jackson, entered warmly, and became one of its chief leaders. During the whole of Mr. Adams's term of office, Mr. Calhoun, though debarred by his position as vice-president from any active part in congress, gave his countenance and support to the opposition; and in 1823 he was re-elected vice-president on the Jackson ticket, receiving all the votes cast for Jackson, except those of Georgia.—The tariff question had for some years past been a leading topic of public interest. Upon this subject there existed a very serious difference among the supporters of Gen. Jackson. The middle states were at that time almost unanimous for a protective tariff, while the southern and especially the cotton-growing states were for free trade. Mr. Calhoun was the head of this free trade section of the party, while Mr. Van Buren, then a member of the senate from New York, was conspicuous on the other side. It was by his management and his votes that the tariff bill of 1828 was so amended as to be carried through congress, contrary to the expectation which Mr. Calhoun and the free traders had formed, that by adhering to certain provisions desired by the middle states but disagreeable to the shipping interest of New England, Mr. Van Buren and other middle state senators would keep the bill in a shape to be defeated by the combined vote of New England and the South. Mr. Eaton, a senator from Tennessee, supposed to represent the feelings and opinions of Gen. Jackson, cooperated with Mr. Van Buren in this movement, which led Mr. Calhoun to doubt whether the general could be relied upon to bring the protective system to an end. Accordingly he began to cast about for other

means. He turned his attention to the sovereignty of the states, and from being charged with being too national, soon after fell under the accusation of pushing the doctrine of state rights to extremes. Building on the Virginia and Kentucky resolutions of 1798-'9, he propounded the doctrine of nullification, that is to say, the right of each state to prevent the execution within her limits of such acts of congress as she might judge unconstitutional. This doctrine he embodied in an elaborate paper, prepared in the summer of 1828, which being put into the hands of a committee of the South Carolina legislature, and being reported to the house with some softening modifications, was, though not adopted by it, ordered to be printed, and became known as the "South Carolina Exposition." The original draft of this document, in which the whole course subsequently taken by South Carolina is clearly shadowed forth, may be found in vol. vi. of Mr. Calhoun's collected works. At the next session of congress, the first under Gen. Jackson's administration, this doctrine of nullification was brought forward in the senate of the United States by Mr. Hayne of South Carolina, in the speech to which Mr. Webster made his famous reply, and in which, though he answered Mr. Hayne, he struck through him at Mr. Calhoun, who was supposed, though not then certainly known, to be the father of the doctrine. Meanwhile there had occurred a great struggle for influence and predominance with Gen. Jackson between the advocates of the tariff and of free trade. Mr. Van Buren had been appointed secretary of state. Two of Mr. Calhoun's friends had seats in the cabinet, and a fair share of the other offices was given to that side; but their influence with the president was not so predominating as they had hoped, and the idea was soon started among them of superseding Gen. Jackson at the end of his first term and electing Mr. Calhoun in his place. This idea was not agreeable to Gen. Jackson, and things tended fast toward a rupture. Personal alienation soon followed. Gen. Jackson had already sought and soon after obtained a statement from Mr. Crawford of what had occurred in Mr. Monroe's cabinet on the subject of the Seminole war. This statement he transmitted to Mr. Calhoun, who admitted its substantial correctness. Thereupon Gen. Jackson concluded, from this in conjunction with other circumstances, that Mr. Calhoun had been at the bottom of the congressional attacks upon him. The next step in this political schism was the establishment at Washington of the "Globe" newspaper, with a design to supersede the "Telegraph," which had been always under the influence of Mr. Calhoun, to whom it still adhered. Early in 1831, Mr. Calhoun published a pamphlet with a preliminary address to the people of the United States, containing a body of correspondence in relation to the Seminole affair. But though sustained by the "Telegraph" and by a few members of congress and a small section of the Jackson party, he was not

able materially to diminish the popularity and influence of the president, who soon proceeded to reconstruct his cabinet, Mr. Calhoun's friends being requested to follow the example of resigning set by Mr. Van Buren. Mr. Van Buren was appointed minister to England, but at the ensuing session of congress, by a coalition between the old opposition led by Clay and Webster and Mr. Calhoun's friends, the nomination was rejected, Mr. Calhoun presiding, and twice upon ties voting for the rejection. This rejection of Mr. Van Buren led to his nomination and election to the post of vice-president; whereupon, without waiting for the expiration of his term, Mr. Calhoun resigned, being elected to fill the seat in the senate which Mr. Hayne had vacated to become governor of South Carolina. In the summer of 1831, shortly after the reconstruction of Jackson's cabinet, Mr. Calhoun had published an address on the relation which the states and general government bear to each other. In this address he had maintained the right of the states to judge of infractions of the constitution, and in such cases to protect themselves. He insisted that the general recognition of this doctrine would of itself, in a great measure, supersede the necessity of its exercise, by impressing on the movements of the general government that moderation and justice so essential to harmony and peace in a country so extensive as ours. The greater part of this address was occupied, however, in advocating the free trade side of the tariff question, and in urging upon congress to take occasion from the paying off of the national debt to reduce the revenue to the level of expenditure, abandoning any attempt at protection beyond that which might be incidental to the collection of such a revenue. But no attention was paid to this advice. The new tariff of 1832 was as protective as the old one. On the application of Governor Hamilton of South Carolina, Mr. Calhoun now addressed to him a long and elaborate letter in defence of his doctrine of state rights, and of its practical efficiency. It was at once determined to act upon this doctrine, and the same legislature which elected Mr. Hayne governor and placed Mr. Calhoun in the senate proceeded to authorize a state convention, according to the scheme set forth in Mr. Calhoun's original draft of the "South Carolina Exposition." That convention had met, and had passed an ordinance, to go into effect on Feb. 1, to nullify the tariff of 1828 and 1832; and when Mr. Calhoun took his seat in the senate, Dec. 1832, the legislature was again in session enacting laws to carry out this nullifying ordinance. The president on his part had issued a proclamation, entreating the people of South Carolina to reconsider their position, and announcing his intention to sustain the laws of the United States by force if necessary. He also sent to congress a special message calling for additional legislation to aid him in enforcing the collection of the revenue. This message led to

a law, reported by the judiciary committee and defended by Mr. Webster, but stigmatized by its opponents as the "force bill," and very warmly opposed by Mr. Calhoun and his friends in the senate. He also introduced a series of resolutions on the powers of government, which he sustained in an elaborate speech, Feb. 15, 1833, in support of the right of nullification, which right, taken in connection with the power of amending the constitution by the consent of three-fourths of the states, amounted, as Mr. Calhoun contended in this speech, to an appeal in contested cases from the general government to the states themselves, to be decided by a three-fourths vote. Though Mr. Calhoun and Mr. Clay were not at this time on speaking terms, Mr. Calhoun was consulted through a third party as to Mr. Clay's compromise tariff of 1833, the passage of which just at the close of the session prevented the impending collision between South Carolina and the general government. He agreed to accept it as an arrangement of the tariff controversy. It provided in fact for a gradual reduction of the revenue, and an abandonment of the protective system at the end of 10 years. He spoke and voted for it, though very unwillingly as to some of its clauses, the home valuation clause especially. He spoke and voted against Mr. Clay's bill, passed at the same session, but defeated by the president's veto, for distributing among the states the proceeds of the public lands.—The settlement of the tariff question was speedily followed by the removal by the president's order of the public deposits from the bank of the United States, the recharter of which had the year before been defeated by his veto. In the violent struggle in congress, as well as the country, which grew out of that removal, Mr. Calhoun joined with Messrs. Clay and Webster against the administration. In a speech of great energy in support of Mr. Clay's resolutions, condemnatory of the removal of the deposits, he accused the president of attempting to seize on the powers of congress, and to unite in his own hands the sword and the purse. In his view this was a struggle between a congressional bank and an executive bank, for such was the light in which he regarded the league of banks to which the deposits had been transferred. In that view he sided with the opposition, though had it been a question, as he expressed himself, of divorcing the government altogether from banks, he should have hesitated much to be found on the side of the banking system, which he considered very defective and dangerous. In supporting these resolutions he declined, however, to join in denouncing as a usurpation the president's removal of Mr. Dallas from the office of secretary of the treasury, because he refused to remove the deposits, and the appointment of Mr. Taney in his place. He held it to be only an abuse, not a usurpation of power, and one that point obtained from Mr. Clay a modification of his resolutions. In a speech on Mr. Webster's bill to continue the

bank for 5 years, giving up the monopoly and some other matters to which objection had been made, Mr. Calhoun argued in favor of a recharter for 12 years. He took the ground that the currency was in a disordered condition produced by the banks, but from which it could only be extricated by bank agency. A national bank was a necessary agent, as he expressed it, "for unbanking the banks," to an extent at least sufficient to restore a safe currency, which purpose he proposed to accomplish by gradually getting rid of bank notes under \$20. He joined with Mr. Webster against Mr. Clay in supporting Mr. Benton's project of raising the relative value of gold and silver to the Spanish standard of 1 to 16. He also warmly supported against Mr. Clay Mr. Benton's bill for branch mints.—The bank controversy led to an amalgamation of the national republican opposition, so called, the late supporters of Mr. Adams's administration and present friends of Mr. Clay, with that fragment of the Jackson party which, on state right grounds, had followed Mr. Calhoun out of it, but without going the length of nullification. This combined opposition took the name of whigs, assumed by them as indicative of their opposition to executive usurpation. The South Carolina nullifiers—an appellation often reproachfully used, but which Mr. Calhoun did not hesitate to apply to himself—still continued a body by themselves, to which he served as chief; for while cooperating for the next 4 years with the whigs, he declined to be classed as of their number. In reference to this subject he declared, in one of his speeches, that he had voluntarily put himself in the very small minority to which he belonged to save the gallant state of South Carolina, nor would he turn on his heel to be placed at the head of the government. He believed that corruption had taken such a hold of it, that any man who attempted reform would fall to be sustained.—The next session witnessed the commencement of those discussions on the subject of slavery, which have since occupied so much of the public attention. The steps taken toward the abolition of slavery in the British colonies, and the preceding and attendant discussions in that country, had led to the formation of the American anti-slavery society, which displayed its zeal in getting up petitions to congress for the abolition of slavery in the territories and the district of Columbia, and in the wide distribution, for which purpose the U. S. mail was largely used, of tracts and papers denunciatory of slavery, many of which were sent to the southern states. The arrival of these documents in the South happened to be coincident with a slave insurrection in Mississippi, and also with the nomination of Mr. Van Buren to the presidency by a convention of the democratic party held at Baltimore. Very loud complaints were at once raised against this proceeding, as tending, if not intended, to excite the slaves to revolt. Mr. Van Buren's nomination, though favored by Gen. Jackson, had been

warmly opposed by a large southern section of the party, which, in consequence, seceded and nominated as their candidate Judge White of Tennessee. The existence of this northern anti-slavery agitation was strongly urged in the southern states as an objection to voting for a northern candidate for the presidency. Mr. Van Buren's political friends in the northern states, by way of relieving their candidate and themselves from any odium on this score, had joined with the mercantile interest in the northern cities in loudly denouncing the abolitionists. It was under these circumstances that the president referred to the subject in his annual message. While testifying to the general feeling of indignant regret which the proceedings of the abolitionists had aroused at the north (to be no doubt followed up by legislation if needed), he referred to the post office as specially under the guardianship of congress, and suggested a law to prohibit, under severe penalties, the circulation in the southern states, through the mail, of incendiary publications intended to instigate the slaves to insurrection. Mr. Calhoun moved the reference of this part of the message to a special committee, and after some opposition from administration senators, who preferred the post office committee, the motion was carried, and Mr. Calhoun was appointed the chairman. He soon brought in a report, and a bill along with it, subjecting to severe penalties any postmaster who should knowingly receive and put into the mail any publication or picture touching the subject of slavery, to go into any state or territory in which the circulation of such publication or picture should be forbidden by the state laws. This report, starting with the doctrine that the states were sovereign as to each other, bound together only by compact, and that the right of internal defence was one of their reserved rights, proceeded to argue that it belonged to the states respectively, and not to congress, as the president's message had assumed, to determine what publications were to be prohibited. The objection taken in the message to the publications in question had been that they were intended to stimulate the slaves to insurrection. Mr. Calhoun's report went far beyond that. It principally objected to these documents, that their avowed object was the emancipation of the negroes, a measure which involved not merely a vast destruction of property, but what was of infinitely more consequence and danger, the overthrow of the existing relation between the two races inhabiting the southern states—the only relation, as the report contended, compatible with their common happiness and prosperity, or even with their existence together in the same community. Social and political equality between the two races was impossible. To change the condition of the Africans would put them in a position of looking to the other states for support and protection; it would make them virtually the allies and dependents of those states; thus placing in the hands of those states an effectual instrument to destroy the influence

and control the destiny of the rest of the union. The object aimed at by the abolitionists was the destruction of a relation essential to the peace, prosperity, and political influence of the slaveholding states. The means employed were organized societies, and a powerful press, which strove to promote the object in view, by exciting the bitterest animosity and hatred among the people of the non-slaveholding states against the citizens and institutions of the slaveholding states. Such a proceeding tended to the erection of a powerful political party, the basis of which would be hatred against the slaveholding states, and of which the necessary consequence would be the dissolution of the union. It was, therefore, not merely the right of the southern states to exclude those publications, it was also the duty of the northern states, within which the danger originated, at once to arrest its further progress—a duty which they owed not merely to the states whose institutions were assailed, but to the union, the constitution, and themselves. In this report, as well as in his speech in support of the bill, Mr. Calhoun drew an alarming picture of the numbers and zeal of the abolitionists, and of the danger to which the South was exposed from their machinations. He predicted that the obligation resting on the northern states to put a stop to these proceedings would totally fail to be fulfilled. He had not much more hope from congress, but he saw the safety of the South in "the doctrine of state interposition, carried into successful practice on a recent occasion." The bill, though helped along by Mr. Van Buren's casting vote, failed on the final vote, 25 to 19. With respect to petitions for the abolition of slavery in the territories and the district of Columbia, Mr. Calhoun held that they ought to be rejected altogether. He took the ground that congress had no jurisdiction over the subject of slavery, in whatever form it might be presented—no more power over it in the district of Columbia than in the states. The senate, however, decided to receive the petitions and then to reject their prayer. On this latter proposition Mr. Calhoun refused to vote.—Though still voting against Mr. Clay's bill for the distribution among the states of the proceeds of the public lands, he took an active part in favor of the bill for depositing with the states the large accumulated surplus of public moneys, the accumulation of which as a "corruption fund" he had often lamented. The victory of San Jacinto having introduced into congress the question of recognizing the independence of Texas, Mr. Calhoun declared himself not only in favor of that, but of the simultaneous reception of Texas into the union. On the question of the admission of Michigan, he denied the power of the states to confer on aliens the right of voting. He denounced as revolutionary the action of the people of Michigan in forming for themselves a state constitution without waiting for the consent of congress. He expressed his strong dissent

from the principle assumed, as he received in the final bill for admitting Michigan, that the will of a mere numerical majority was paramount to the authority of law and constitution. In connection with this subject he took occasion to address to Mr. Van Buren, lately elected to the presidency, but still presiding in the senate, an emphatic condemnation of the "odious party machine" to which he owed his nomination and election, as the commencement of a most dangerous change, which threatened to supersede the authority of law and constitution by the edicts of a party caucus. Mr. Calhoun had all along opposed Mr. Benton's resolution to expunge from the journal of the senate the censure upon President Jackson for removing the public deposits from the U. S. bank. He vehemently denounced it now at the moment of its passing as a plain violation of the constitution. He stigmatized the vote in favor of it as originating in "pure, unmixed personal idolatry, a melancholy evidence of a spirit ready to bow at the feet of power." He had for some time been on bad terms with its mover, and had spoken of him with great asperity. As might be expected, he voted with Messrs. Clay and Webster against the confirmation of Mr. Taney as chief justice of the United States. The great accumulation of public money in the deposit banks had led to extensive purchases of public land, by means of money borrowed from these banks, which purchase by increasing the public money on deposit led to new loans and new purchases. The president, just after the close of the late session of Congress, had attempted to check this speculation by issuing a circular order to the land offices to receive nothing but gold and silver in payment for public lands. Mr. Calhoun joined with the opposition in denouncing this circular as illegal and unconstitutional, though he declined to concur in the measure resorted to to get rid of it, principally because it seemed to admit the president's power to issue the order. Another administration measure, professing to have in view the checking of land speculation, was a bill to restrict the sale of the lands to actual settlers in limited quantities. Mr. Calhoun opposed this bill as really intended for the benefit of the speculators who had already overloaded themselves with lands, and whose interest it therefore was to restrict further purchases. In the course of his speech he denounced these speculations as having been directly caused by the action of the government in putting down the national bank and placing the public money in banks arbitrarily selected by the executive, and he charged that high officers of government and persons closely connected with the president had used these depositories as instruments of speculation in the public lands. What he said on this subject was understood by President Jackson as a personal attack on him, and he addressed an imperious letter to Mr. Calhoun, calling upon him either to retract or to bring his charge before the house of representatives as the basis of an im-

peachment. Mr. Calhoun read this letter in the senate. He spoke of it in very severe terms as a breach of privilege, and an attempt to intimidate, and proceeded to repeat what he had said; that many in high places were among the speculators in public lands, and that even an individual connected with the president himself (one of his nephews whose name he now gave) was a large speculator. He soon after brought forward a plan for the cession of all the public lands to the states in which they lay, to be sold by them at graduated prices extending over a term of 35 years, the states to bear the expenses, and to pay over to the general government a third of their receipts. But this proposition, denounced by the administration side as a bid for the favor of the new states, received only 3 votes. Mr. Calhoun reserved at this session his attack upon anti-slavery petitions, insisting that they must be rejected, and that the abolitionists must be silenced, and that not by letting them alone, but by prompt and efficient measures, or the union could not continue. He refused to admit, even by implication, that the existing relations between the two races in the slaveholding states was an evil. He held it to be a positive good, and developed a theory on this subject which has since obtained a wide currency and acceptance. Not only was it a good morally and economically, it formed, so he maintained, the most solid and durable foundation on which to rear free political institutions. He opposed with earnestness the resolution appropriating \$30,000 to purchase the Madison papers, as not authorized by the constitution. He admitted in this speech that when a young man, and at his entrance on political life, he had inclined to that interpretation of the constitution which favored a latitude of powers; but experience, observation, and reflection had wrought a great change in his views, and above all the study of the argument of Mr. Madison himself in his celebrated resolution of 1798.— Before the next session of congress a great financial crisis occurred, which Mr. Calhoun had foreseen, and had foretold as a consequence of the monetary policy pursued during Gen. Jackson's second term. Shortly after Mr. Van Buren's inauguration, all the banks, the deposit banks along with the others, stopped specie payment. At the extra session which commenced in September, President Van Buren recommended the policy of discontinuing the use of banks as the fiscal agents of the government. He proposed the custody of the public money by officers specially appointed for that purpose, and the exclusive use of coin on the part of the government. Mr. Calhoun, separating from the wings, with whom he had acted in the struggle on the bank question, gave energetic support to this new system of policy. He did the same at the ensuing regular session. This created on the part of his late allies, who in the close division of parties could ill spare his vote, strong feelings of personal resentment. Mr. Clay, in replying to Mr. Calhoun's speech on the inde-

pendent treasury bill, not only taunted him with desertion, but made his whole political career the subject of one of those invectives in which he so greatly excelled. Mr. Calhoun replied (March 11, 1838); Mr. Clay answered on the spot, and Mr. Calhoun rejoined. This contest abounded with exemplifications of the different kinds of oratory of which each was master; on the one side declamation, vehement invective, wit, humor, and biting sarcasm; on the other, clear statement, close reasoning, and keen retort. These speeches, apart from their rhetorical merits, are of high historical value, from the light they throw upon the secret history of the compromise of 1838. Mr. Calhoun laid great stress upon his, as being the vindication of his public life. In one of his replies to Mr. Clay he declared that he rested his public character upon it, and desired it to be read by all who would do him justice. He did not confine himself to defend, but retorted blow for blow. Some sharp passages also occurred between him and Mr. Webster. Previous to this debate he had been involved in another, in which he had almost the whole senate upon him. It was equally the policy of both the political parties to keep the slavery question out of congress, as a subject upon which it was very difficult to speak or act without offending either the North or the South. With this intent, both houses had adopted rules, the result of which was that all petitions and memorials on that subject were at once laid upon the table, without being read or debated. The northern whigs had indeed voted against this, contending that all petitions ought to be received and referred to their appropriate committees, but still they were as well satisfied as their opponents to avoid or escape debate. Mr. Calhoun did not sympathize in this feeling. Unlike the leaders of the two great political parties, he had no friends to be placed in an awkward predicament, nor any apprehensions of compromising himself. He had already declared his conviction that slavery was a positive political and social good. It appears by a letter of his written in 1847, to a member of the Alabama legislature, and published since his death, that he was from the beginning in favor of "forcing," as he expressed it, the slavery issue on the North, believing that delay was dangerous, and that the South was relatively stronger, both morally and politically, than she would ever be again. Not discouraged by the failure of the South, and even of his own state, of which he complained in the letter above referred to, to back up sufficiently his former attempts, he had offered a series of resolutions having the same object in view. The chief debate was on the fifth, which declared that the intermeddling of any state or states, or their citizens, to abolish slavery in the territories or the district of Columbia, on the ground that it was immoral or sinful, or the passage of any measure by congress with that view, would be a direct and dangerous at-

tack on the institutions of all the slaveholding states. Mr. Clay moved as a substitute two resolutions, one applying to the district, the other to the territories. These resolutions omitted all reference to the moral or religious character of slavery. For "intermeddling" they substituted "interference." The abolition of slavery in the district was pronounced a violation of the faith implied in the cessions by Maryland and Virginia, and its abolition in any territory a breach of good faith toward the inhabitants who had been permitted to settle with their slaves therein, and, in both cases, a ground of just alarm to the slaveholding states, tending to disturb and endanger the union. Mr. Calhoun, though not favoring this amendment, perceiving that the senate would go no further, voted for it. In the course of this debate he stated, in reference to the Missouri compromise, that when it was made he was in favor of it, but that he had since been led entirely to change his opinion, and to regard it as a dangerous measure. He had condemned Mr. Randolph's opposition to it as too uncompromising, too impracticable, but was now fully satisfied that if the southern members had acted and voted in the spirit of Mr. Randolph, abolition might have been crushed for ever in the bud. He rejected with scorn Mr. Buchanan's proffer to support the amended resolution, with a view to soothe and tranquillize the feelings of the South. The South was calm and collected, and could take care of herself. He was anxious, and such was his object in offering those resolutions, to present some common ground on which the reflective and patriotic of every quarter of the union might rally to arrest the approaching catastrophe—an object in which the North was at least as much interested as the South. To new charges made against him by Mr. Clay, of being a partisan of the administration, he indignantly replied that he was no partisan of any man or any administration. He supported the constitutional treasury because it accorded with his principles and views of policy; and he stood prepared to oppose or support, on the same ground, other measures which the administration might propose. It was, he said, his fortune to stand in the senate alone, with no other guide but God and his conscience. He sought neither office nor popular favor. He also denied explicitly any connection with or knowledge of the existence of any party aiming at disunion. On the contrary, he was seeking to preserve the union, by opposing injustice and oppression against the weakest and most exposed section of it, in which it was his lot to be cast. In a subsequent speech on the repeal of the salt tax, he insisted that the union was much more in danger from consolidation than from dismemberment, and that South Carolina, in striking the blow which led to the compromise of 1838, aimed not to destroy but to preserve the union, an object to which that blow had essentially contributed by bringing the protective system to the ground.—Having become a sup-

porter of the leading measures of the administration, Mr. Calhoun called upon Mr. Van Buren and removed that personal intercourse which had for 8 years been suspended. The plan of separating the treasury from the banks, which had failed in the 25th congress, succeeded in the 26th, and to that success Mr. Calhoun essentially contributed. The denial by congress of the right of petition having become a subject of loud complaint, Mr. Calhoun, in a speech on that topic, insisted that the right of petition was only important in despotic governments, and had been superseded in the United States by the right of suffrage and the practice of legislation (which practice, however, he did not allow to have any constitutional or rational basis). The right of petition had degenerated into a means of assault upon others. His vehemently opposed Mr. Clay's proposition to receive the anti-slavery petitions and to argue the case with the petitioners. To consent to argue the matter would bring down the high moral tone of the South, and would do infinitely more harm there than it could do good to the North. He opposed both the preemption and graduation system proposed by the administration, and the distribution of the proceeds of the public lands among the states, favored by the opposition. As a substitute, he again brought forward his scheme of ceding the public lands to the states. He gave his support to Mr. Van Buren as a candidate for reelection, and induced the state of South Carolina to vote for him. To the measures brought forward by the whigs on their short-lived accession to power, consequent upon the defeat of Mr. Van Buren, he gave his decided opposition, attending, for the first time since his breach with Gen. Jackson, the private sittings of the democratic members. He defended, in an elaborate speech, the veto power from the attack made upon it by Mr. Clay, in consequence of President Tyler's veto of the bills for chartering a United States bank. He denounced the tariff of 1842 as not only a violation of the compromise agreed upon in 1833, but, in its details, exceedingly oppressive, and in the circumstances of its enactment worse even than the tariff of 1825. The Webster-Ashburton treaty with England he voted for, and defended both the clauses in relation to the boundary of Maine and those which referred to the suppression of the slave trade. He closed his speech on this subject with an earnest vindication of the policy of peace. On the same principle he opposed the bill for the occupation of Oregon, urging also that in a hostile contention for its possession, Great Britain, by means of her possessions in the East, and her judgment and armaments on the coast of China, would have greatly the advantage of us. We had but to wait, and with the progress of our population, Oregon would be occupied for us by adventurous settlers; or should there be a struggle, delay was for our benefit, as we were constantly growing relatively stronger. He therefore advocated, on this subject, the policy of a "masterly

inactivity."—With March 4, 1843, Mr. Calhoun's senatorial term came to an end. His two great rivals had previously withdrawn from the senate, Mr. Webster by accepting a seat in the cabinet, and Mr. Clay by resigning. Mr. Calhoun had declined a reelection, and did not appear in the next congress. This retirement was perhaps prompted by the fact that he had been brought forward by his friends as a candidate for the democratic nomination for the presidency, to which party he now considered himself to belong. But though his voice and vote in the senate had been willingly accepted, he still remained an object of suspicion and dislike to that large section of the party over whom, or at least its leaders, Mr. Van Buren retained a predominant influence. Instructions having been given to a majority of the delegates to the approaching nominating convention to vote for Mr. Van Buren, Mr. Calhoun, in Feb. 1844, addressed a letter to his political friends, severely criticizing the principles on which that convention was to be constituted, and refusing, on that ground, to allow his name to go before it. This letter appears to have been written with a view to another convention at New York, toward which some steps were taken, but which was not carried out. Meanwhile, Mr. Calhoun, toward the last of March, 1844, was unexpectedly called by President Tyler (who was a candidate also for the nomination of the democratic convention) to fill the place of secretary of state. From that office Mr. Webster had been ejected as preparatory to a negotiation for the annexation of Texas, and it had again become vacant by the sudden death of Mr. Upshur. The letter had already set the negotiation on foot, and, in fact, had nearly arranged informally the terms. The Texans had, however, insisted, as preliminary to a formal treaty, upon a pledge that if, pending its negotiation or before its ratification, they should be invaded by Mexico, with which country an armistice had been arranged, the army and navy of the United States should be employed to defend them. This pledge, given by the American minister in Texas, President Tyler had refused to ratify, on the ground that it exceeded his constitutional powers; but as the Texan commissioners positively refused to treat upon any other terms, Mr. Calhoun renewed it. It took but a few days to put the treaty in form, and immediately upon its signature, which took place on April 12, detachments of the army and navy were sent to the frontiers of Texas and the coast of Mexico. The ground of the invitation extended to Texas by President Tyler to renew her application, already 3 times rejected, for union with the United States, was the apprehension of interference on the part of the British government, to procure the abolition of slavery in Texas, as a step toward its abolition in the United States. The facts on which those apprehensions were based had first been brought to the notice of President Tyler through the agency of Mr. Calhoun, who was thus the real author of

the annexation movement. Lord Aberdeen, in disclaiming on behalf of the British government the special facts alleged, or any secret plot for the abolition of slavery in Texas, or any disposition to resort either openly or secretly to any measures which would tend to disturb the peace and tranquillity of the slaveholding states, or the prosperity of the union, admitted however at the same time, as a thing well known both to the United States and everywhere else, that Great Britain desired and was constantly exerting herself to procure the abolition of slavery throughout the world. In replying, shortly after the treaty was concluded, to this despatch, Mr. Calhoun took the latter admission as an admission also that the British government was laboring to procure the abolition of slavery in Texas, and as having justified on the part of the United States, as a necessary act of self-defence, the treaty of annexation just concluded. The Mexican minister at Washington had given repeated notices that the signature of a treaty of annexation would be regarded by Mexico as an act of war. The treaty, and along with it a copy of Lord Aberdeen's despatch and Mr. Calhoun's reply to it, was sent to the American minister at Mexico, with directions to disavow any disrespect to that country, or indifference to its honor or dignity, and to represent that the efforts of Great Britain to abolish slavery in Texas—which, if accomplished, would lead to a state of things dangerous in the extreme to the adjacent states and the union itself—had compelled the United States to sign the treaty of annexation without stopping to obtain the previous consent of Mexico. The disposition, however, was expressed to settle all questions which might grow out of this treaty, including that of boundary, on the most liberal terms; and the minister was privately authorized to tender Mexico by way of peace offering and indemnity as much as \$10,000,000. On the day of the date of this letter (April 19) the treaty was sent to the senate, where, after a warm debate, it was rejected by a vote of 85 to 16. Previously, however, to this rejection, the treaty had had the effect to defeat Mr. Van Buren's nomination by the democratic convention. He as well as Mr. Clay, the candidate of the whigs, had avowed himself opposed to immediate annexation, on the ground that it was equivalent to war with Mexico. In consequence of this avowal Mr. Van Buren, though voted for by a majority of the convention, failed to obtain the two-thirds vote which the rule of that body required, and eventually Mr. Polk was nominated. Mr. Polk went into the canvass as the avowed advocate of immediate annexation, and the election having resulted in his favor, he became very urgent to have the matter acted upon by congress before his accession to office. At the ensuing session, joint resolutions were introduced for receiving Texas into the union. These resolutions could be carried through the senate only by annexing an alternative provision for a negotiation to be opened on the

subject with Texas and Mexico (the president to act under either provision as he might deem best), and by means of a promise from Mr. Polk that he would act under the latter provision. In this, however, he was anticipated by Mr. Calhoun. Within 8 days after the passage of the resolutions, and on the last day of President Tyler's term of office, he despatched a messenger to Texas to bring her in under the first provision. As Mr. Polk did not see fit to recall this messenger, it is reasonable to suppose that the message was sent with his approval. Mr. Calhoun, who was engaged in negotiations with Great Britain on the subject of Oregon, would have been willing, and expected to retain his position as secretary of state. Though not included in the new cabinet, he was offered the place of minister to England, but declined to accept it. He did not, however, retire to private life. One of the South Carolina senators resigned his seat to make room for him, and at the next session (Dec. 1845) he reappeared at Washington as a senator. In the violent debate at that session on the Oregon question, which threatened to involve a war with Great Britain, he announced himself the decided advocate of compromise and peace. He deprecated war not merely for the cost and slaughter it would involve, but still more for the social and political changes by which it would be attended, especially the increase of the power of the federal government. The Oregon question was peacefully settled. The controversy pending with Mexico ended in war. Though the Mexican government had at first indignantly rejected the advance toward a settlement made by Mr. Calhoun, they had afterward consented to receive a minister, and it is probable that had an arrangement been seriously and skilfully sought, it might have been effected. The great difficulty was not the unwillingness of the government, but the unpopularity with the people of any concession, which was therefore dangerous to the stability of any government that might venture to consent to it. Without waiting for the Mexican people to become reconciled to a treaty, the president ordered the American troops in Texas to take possession of the disputed territory on the north bank of the Rio Grande. When the Mexicans opposed by force this occupation, the president informed congress that our territory had been invaded and that war had been commenced by the Mexicans, and requested that body to recognize its existence and provide for its prosecution. Mr. Calhoun spoke against the bill introduced for this purpose, but as the case was hopeless did not record his name against it. He was, however, utterly opposed to the war thus commenced, both as unnecessary and unjust. At the next session, the American forces having already occupied the northern provinces of Mexico, Mr. Calhoun, in his speech on the 8 million bill, advocated the policy of abstaining from further invasion. He proposed to hold the country already in

possession as a means of forcing the Mexicans to leave, the line of occupation which he recommended being nearly coincident with the boundary afterward obtained, except that it included the peninsula of Lower California. In this speech he declared himself very strongly against any attempt upon the independence of Mexico or the absorption of her inhabited territory. Mr. Calhoun's opposition to the Mexican war drew down upon him two severe attacks on the floor of the senate. In answer to Mr. Turney, he indignantly repelled the charge of ambitious designs. He was not, he said, an aspirant for the presidency, and never had been. At his time of life the presidency was nothing. He would not accept it unless it came to him by the voice of the American people, and then only from a sense of duty. The position was respectable, but there were others infinitely more so. He had rather be an independent senator, devoted to the good of the country, than to be president of the United States, put there as presidents of the United States had been for many years past. What was wanted above all things in the public men of America was independence. In reply to Mr. Benton's charge that it was he who had plunged the nation into the Mexican war, he accepted the imputation of being the author of the annexation of Texas, but he insisted that the responsibility for the war belonged to the president, who had violated the constitution by marching troops on his own authority into the disputed territory, and by the collision thus brought on had forced congress to recognize as a fact a war which that body could never have been induced to declare or to commence.—The Wilmot proviso (that in any territory acquired from Mexico, slavery should be prohibited) having been brought forward in the house as an amendment to the 3 million bill, and this proviso having been warmly urged by resolutions adopted by the united vote of both political parties in the legislatures of many of the free states, Mr. Calhoun again stepped forward as the leader and champion of the slaveholding interest. He introduced a series of resolutions, in which, starting from the principle that the United States are but the states united, and that the territories are the joint property of these states, he denied that congress had power to make any law which should directly or indirectly deprive any state of its full and equal right in this common territory; and that any law operating to prevent the citizens of any of the states from emigrating with their property into any of the territories, would be a violation of the constitution, and would tend directly to subvert the union. No vote was taken in the senate upon these resolutions, but their doctrine, so far as relates to the exclusion of slavery from the territories, has since been fully sustained by congress in the repeal of the Missouri compromise prohibition, and by the supreme court of the United States, in the *Dred Scott* case. Mr. Calhoun supported these resolutions, not only in 2 speeches in the senate, but in a speech delivered

shortly after the adjournment, March 8, 1847; at a meeting of the citizens of Charleston. He maintained in these speeches that the slaveholding states were the necessary bulwark of the union, and that it was essential to their own safety and that of the union that they should continue to have at least an equality in the senate, an equality to be maintained at all hazards. He stated in his speech on affixing these resolutions that, though he had always considered the Missouri compromise line a great error, surrendering as it did for temporary purposes the constitutional rights of the South, yet for the sake of peace he would be willing to acquiesce in the extension of that line to the Pacific. Of the 2 motions to that effect voted down in the house, the first had been offered by his procurement and on his suggestion. In the course of the following summer he wrote the letter already referred to, in which he developed his policy of "forcing the issue with the North." In this point of view he would regret any compromise or adjustment of the proviso, or even its rejection, without a settlement at the same time of the entire question. He complained in this letter of the recent repeal by Pennsylvania of her law allowing travellers and transient visitors to that state to retain their slaves for a limited term, and of similar repeals in other states. He insisted that the toleration at the North of societies, presses, and lectures which called in question the right of slaveholders to their slaves, and whose object was the overthrow of the institution, could not be acquiesced in without the certain destruction of the relation of master and slave and the ruin of the South. To the question, what remedy there was short of a dissolution of the union, he replied: "Only one—retaliation." The violation of the constitution on the part of the North must be met by refusing to fulfill stipulations in their favor, of which the most efficient was the cutting off of their ships and commerce from entering into southern ports. But, to make this measure effectual, all the southern seaboard and gulf states must join in it, for which purpose a convention of the southern states was indispensable.—At the ensuing session of congress, the city of Mexico being then in the possession of Gen. Scott, Mr. Calhoun submitted (June, 1848) a resolution that to conquer Mexico and to hold it as a province, or to incorporate it with the union, would be a departure from the settled policy of the government, in conflict with its character and genius, and subversive in the end of our free and popular institutions; and he again urged, if a treaty could not be made, his plan of the defensive occupation of such a line as might be fixed on for the boundary. News having soon arrived that a treaty was signed, he warmly opposed the 10 million bill and all other measures looking to a continuation of hostilities. He took occasion also to condemn, as unconstitutional, the duties and taxes which had been levied in Mexico on the president's sole author-

ity. A resolution having been offered in the senate congratulating the French on the success of their revolutionary struggle, he moved to lay it on the table, on the ground that it remained to be seen, in the sort of government to which this revolution might lead, whether it proved a blessing or a curse to France and the world. Mr. Calhoun warmly opposed a bill, introduced on the recommendation of the president, to occupy Yucatan, both for the protection of the white population, who, in danger of extermination by the Indians, had sent to ask assistance, and in order to prevent that country from becoming the colony of some European power. In this speech he explained the origin and objects of the so-called Monroe doctrine, which was assumed by the advocates of the bill as the settled policy of the country. That he denied. Mr. Monroe's declarations were made for a temporary purpose, and had never been acted upon. He saw no advantage to be expected from Yucatan at all commensurate with the cost of its acquisition and the burden of its defence. As to the question of protecting the white race there against the Indians, his sympathies were with the white race, though he denied any aversion to any race, red or black. But it was not quite clear that the war in Yucatan was a war of races, and still less was it clear that the whites were blameless in the matter. Moreover, there was a tendency in all the Spanish American republics to a conflict of the same kind between the whites and the Indians. "Are we to declare now by our acts that in all these wars we are to interpose, by force of arms, if need be, and thereby become involved in the fate of all these countries? Ought we to set such a precedent? No. The first duty of every nation is to itself, and such is the case, preëminently, with the United states. They owe a high duty to themselves—to preserve a line of policy which will secure their liberty. The success of their great political system will be of infinitely more service to mankind than the ascendancy of the white race in the southern portions of this continent, however important that may be." In his speech (June 27, 1848) on the bill to organize the Oregon territory, he warmly opposed the extension to that territory of the anti-slavery provision of the ordinance of 1787. Carrying out the principles of his resolutions, he not only denied any power in congress to exclude slavery from the territories, but in still stronger terms, any power to do it on the part of the inhabitants or legislatures of the territories. Even admitting the power in congress, he denied the justice of excluding the South from any participation in territory, to the obtaining of which she had contributed her full share of money and blood, and to the enjoyment of which she had an equal right. He started in this speech the suggestion that the constitution of the United States, extending into the territories acquired from Mexico, operated to repeal the Mexican laws abolishing slavery. In a

second speech, he went into an elaborate history of the rise and progress of abolition at the North. He complained that the South had encouraged and aided it by admitting political fellowship with politicians who coquetted with abolitionists. He insisted that if the South wished to save the union, or save herself, she must rouse to instant action, such as would evince her fixed determination to hold no connection with any party in the North not prepared to enforce the guarantees of the constitution in favor of the South. By taking that course, a host of true and faithful allies would rally to their support even in the North; or, if not, it would only prove that the South had nobody but herself to depend upon. But it was not merely on the territorial question that the rights of the South must be respected. He enumerated the same grounds of complaint mentioned in the Alabama letter (which had not yet been made public), to which he added the agitation of the slavery question in as well as out of congress, and the total neglect into which the fugitive slave law had fallen—thus laying the foundation of the new fugitive slave act passed soon after. Messrs. Benton and Houston having voted for the anti-slavery clause in the Oregon bill, he denounced them with energy as traitors to the South.—In the election struggle between Gen. Taylor and Mr. Cass, Mr. Calhoun does not appear to have taken much interest. At the short session following the election of Gen. Taylor, he was very busy in efforts to form a union of the slaveholding states, irrespective of all preëxisting party differences, to resist the progress of abolition. For that purpose a series of meetings was held, at which none but slaveholding members were present, and attended at times by 70 or 80 members, a part of whom were, however, not favorable to the object of the meeting. At the first meeting a committee of 15, one from each state, was appointed to report resolutions. This committee appointed a sub-committee of 5, at the head of which was Mr. Calhoun. He drafted and reported an address, which after some modification was adopted, and signed by 48 senators and representatives. It reiterated the same ground of complaint urged by Mr. Calhoun at the previous session, and proposed the same remedy. The union of the South might bring the North to a pause, a calculation of consequences, and a change of measures; if not, the South would stand justified in resorting to any measure necessary to repel so dangerous a blow, without looking to consequences. At the next session, pending the discussion of Mr. Clay's compromise scheme, Mr. Calhoun, who had been for some time laboring under severe pulmonary disease, to which was now added disease of the heart, prepared an elaborate written speech, which was read for him (March 4, 1849) by another senator. He declared in this speech his belief from the first that the agitation of the subject of slavery would, if not prevented by some time-

ly and effective measure, and in decision. It had, however, gone on till the union was palpably in danger. The question now was, how can the union be preserved? The agitation of the slavery question and the many aggressions to which it had given rise was, no doubt, one cause of the existing southern discontent; but back of that lay another and more potent one. The equilibrium which existed between the two sections of the union when the constitution was framed had been destroyed, and the South was every day sinking in the scale. This had been brought about by federal legislation in excluding the South from the common territory, and overburdening her with taxes; to which was to be added a radical change in the character of the federal government, by which it had concentrated all the powers of the system in itself, and had been transformed from a federal republic, as it originally was, into a great national consolidated democracy. That equilibrium could only be restored by an amendment of the constitution. That amendment he did not specify in this speech, but from his posthumous treatise "On the Constitution and Government of the United States" it would appear to have been the election of 3 presidents, one from the free, the other from the slave states, each to approve of acts of congress before they could become laws. His speech attracted much attention, and was answered by Mr. Webster and Mr. Cass. It was on March 12, in some parenthetical replies to the latter, that Mr. Calhoun spoke in the senate for the last time. He fell back in his seat exhausted, and was taken to his lodgings and his bed, whence he never rose again.—The following is Mr. Webster's estimate of him, delivered in the senate when his death was announced there: "The eloquence of Mr. Calhoun was a part of his intellectual character. It grew out of the qualities of his mind. It was plain, strong, wise, condensed, concise; sometimes impassioned, still always severe. Rejecting ornament, not often seeking illustration, his power consisted in the plainness of his propositions, in the closeness of his logic, and in the earnestness and energy of his manner. Those are the qualities, as I think, which have enabled him through such a long course of years to speak often and yet always to command attention. His demeanor as a senator is known to us all—is appreciated, venerated by us all. No man was more respectful to others; no man carried himself with greater decorum, no man with superior dignity. I think there is not one of us but felt when he last addressed the senate—his form still erect, with a voice by no means indicating such a degree of physical weakness as old in fact possess him, with clear tones and an impressive, I may say an imposing manner—who did not feel that he might imagine that we saw before us a senator of Rome, when Rome survived. I have not in public nor in private life known a more assiduous person in the discharge of his duty. He seemed to have no recreation but the pleasure of conversation with

his friends. Out of the chambers of congress he was either devoting himself to the acquisition of knowledge pertaining to the immediate subject of the duty before him, or else he was indulging in those social interviews in which he so much delighted. His colloquial talents were singular and eminent. There was a charm in his conversation not often found. He delighted especially in conversation and intercourse with young men. I suppose there has been no man among us who had more winning manners in such an intercourse and such conversation with men comparatively young. I believe one great power of his character in general was his conversational talent, and thus, along with tenderness in his integrity and reverence for his talents, it largely contributed to make him so endeared an object as he was to the people of his state. He had the basis, the indisputable basis of all high character, unspotted integrity and honor unimpeached. If he had aspirations, they were high, honorable, and noble; nothing grovelling, low, or meanly selfish came near his head or his heart. Firm in his purposes, patriotic and honest as I am sure he was in the principles he espoused and in the measures he defended, I do not believe that, aside from his large regard for that species of distinction that conducted him to eminent stations for the benefit of the republic, he had a selfish motive or a selfish feeling."—As a private citizen, Mr. Calhoun was highly respectable and exemplary, enjoying the devoted love of his own family and dependants, and the entire respect and sincere regard of his neighbors. He had 10 children, 3 daughters who died in early infancy, and 5 sons and 2 daughters who survived him. His political views were often gloomy. In the senate he sometimes enacted the part of Cassandra. "How often," exclaimed Mr. Clay, in one of his speeches, "have we witnessed the senator from South Carolina, with woe's countenance and in doleful strains, pouring forth touching and mournful eloquence on the degeneracy of the times and the downward tendency of the republic." But in private life he was uniformly cheerful. A personal friend, who had the best opportunities to know him, has furnished us with the following details of his private life at Fort Hill: "Socially he was the most genial and agreeable companion. He entered into the enjoyment of those around him with a sympathy and kindness that endeared him to all. He was fond of prancing innocent mirth, and, though no jester himself, laughed heartily at the jests of others. Though his conversation was ever dignified and never on trivial subjects, yet women and children, and the ignorant as well as the learned, all delighted in his society, and left it with regret. His peculiar charm was his entire forgetfulness of self, and delicate attention to the feelings and wishes of others, which made him the most truly polite man I have ever known. I never saw him depressed or out of humor. He was fond of reading, and in his youth devoted much of his lei-

sure to it, but neither his multifarious occupations nor his cast of mind permitted him to be a general reader. He read to inform himself, and was well informed, but his opinion often expressed was that reading made a secondary, thinking an original mind. He did not disdain, however, but highly enjoyed good poetry, good novels, and able reviews. He was not wealthy, but his pecuniary means, under his excellent management, were amply sufficient for the wants of his family. According to the fashion of his part of the country, he kept open house, and the family seldom sat down alone to a meal. Though himself uncommonly temperate in all things, he enjoyed in moderation the pleasures of the table, at which time he was fond of seeing all his family assembled about him. He used to say that good digestion depended greatly on cheerfulness and equanimity, and he took the lead in promoting at table conversation and gayety. The mode of life at Fort Hill was simple and rational, and the absence of all form and ceremony, combined with real refinement, made it a favorite resort. Though he never permitted company to interfere with his occupations, he was ready at all times to further their enjoyments. The hours after dinner till bedtime were more particularly devoted to conversation, music, &c. Though not musical, he was fond of Scotch and Irish songs and ballads, his favorites among which he would call for evening after evening, and listen to with unfailling pleasure. Mr. Calhoun rose early, and devoted his mornings to writing. He walked a great deal over his plantation, personally superintending its minutest operations. He was the first or one of the first in that region to cultivate successfully small grain and cotton for market. The slope of the mountain where he resided had been considered too cold and variable in climate for cotton as a market crop, and too far south for small grain. From its position, a very elevated country in a southern climate, that district is peculiarly adapted to fruit, to the raising of which Mr. Calhoun devoted much time and attention, and with excellent success. He not only had the finest melons, figs, peaches, and other southern fruits, but his apples, pears, cherries, grapes, strawberries, raspberries, &c., were equally excellent. These, however, were not raised for sale. He was himself extremely fond of fruit, and he delighted in sharing it with others, enhancing its flavor from his kindly manner of making presents of it to his neighbors. He was not only fond of agriculture, but an eminently good and successful planter. There were a few among his neighbors who differed from him politically, but in agriculture his authority was never disputed. His servants were in all respects well treated. He came to him as umpire and judge. Of their private crops he purchased what he wanted at the highest market price, and gave them every facility for disposing of the rest. A rigid justice regulated his conduct toward them, which they repaid by devoted affec-

tion; and this system of management was so successful that to have been an overseer at Fort Hill was a high recommendation. He was always impatient to return home, and remained there till the latest moment. While there, his agricultural employments and social duties, together with his large correspondence, and in his latter years his works on government, occupied every moment of his time. He was an excellent shot, and till his eyesight failed, generally carried a gun as he walked round his place, rarely missing his aim. He was an unwearyed walker, and kept pace with the youngest and strongest of the party. Nature in all her moods and changes was charming to him. He sympathized strongly with her beauty and her grandeur. The mountains near his residence were very wild and picturesque, and he highly enjoyed excursions among them. I have often seen him, when a thunder storm was approaching, walking in his portico, which commanded a fine view of the mountains, apparently wrapt in the contemplation of the sublimity of the scene." In a familiar conversation with an intimate friend a few days before his death—as we learn from another authentic source—he referred in tones of deep interest to the clear streams, the quiet solitudes, and sublime slopes of his native mountain region. In his person Mr. Calhoun was tall and slender. His countenance at rest was strikingly marked by decision and firmness; in conversation, or when speaking, it became highly animated and expressive. His large, dark, brilliant, penetrating eyes strongly impressed all who encountered their glances. When addressing the senate he stood firm, erect, accompanying his delivery with an angular gesticulation, which, with the general cast of his person and character, caused Harriet Martineau to describe him as an "iron man." His manner of speaking was energetic, ardent, rapid, and marked by a solemn earnestness which inspired a strong belief in his sincerity and deep conviction. He disdained all rhetorical circumlocutions, and came directly to the point. He was never commonplace, and never tedious. Upon every subject he was acute, analytical, and original, dealing almost exclusively in argument. His style was forcible, clear, and condensed. He very rarely indulged in tropes and figures, and seldom left any doubt as to his meaning. He himself noted it as a peculiarity of his mind, and one that interfered with his influence over passing events, that he was disposed to follow every thing out to its ultimate results, disregarding its immediate, temporary, and accidental bearings.—The works of Mr. Calhoun have been collected since his death in 6 volumes, the first of which includes a disquisition on government, and a discussion on the laws relative to the government of the United States, which he left behind him unfinished. The editor, Mr. Richard K. Orallé, of Virginia, is understood to have in preparation an elaborate biography of the author, founded on his private papers, and other authentic materials.

CALI, or **SAN JAGO DE CALI**, a prosperous town of New Granada, in the department of Cauca, on a western declivity of the Andes. There are 2 churches and several convents, all but one of which are deserted. Pop. 6,000.

CALIBER, the inner diameter of a hollow cylinder, particularly applied to that of mortars, howitzers, and swivels. Cannon are generally rated by the weight of the ball they carry.

CALIBER COMPASSES, or **CALIBERS**, compasses with legs bowed each into semicircular form, designed for measuring the diameters of balls, cylinders, and objects to which a straight rule cannot be applied. When made especially for artillery use, a scale is applied to them, by which, when the diameter of a ball is found, its weight may be read off; or the weight being given, its corresponding diameter is at once found on the scale. These calipers are merely 2 thin strips of brass connected by a rivet passing through one end of each. Various tables and scales are often introduced upon them, which are likely to be wanted in practice, as tables of specific gravity of bodies, their weights per cubic foot, &c., and scales for the measure of angles, &c.

CALICO (so called from Calicut, on the Malabar coast, whence it was first imported), a term applied in England to white or unprinted cotton cloth, in the United States to cotton cloth upon which colored patterns are impressed with the use of dyes. The effect produced is like that of the colored designs brought out by the loom, but with much greater economy of time and labor. This art is known by the name of calico printing. Its origin, like that of dyeing, is traced back to very remote antiquity, and in some form or other appears to have been practised by nations of little skill in other respects. The aborigines of our own country have been in the habit of staining their garments of different colors, which is a rude method of calico printing; while the natives of Mexico, at the time of its conquest by Cortes, produced garments of cotton, adorned with figures in black, blue, red, yellow, and green colors. The magnificent linen cloths of Sidon with their variegated colors were noticed by Homer; and Herodotus makes mention of the garments of the inhabitants of Caneus adorned with figures of animals dyed in fast colors with infusions of leaves. The account of the process given by Pliny, as practised by the ancient Egyptians, is particularly interesting for showing the skill there attained in the art, as also for describing with great conciseness the principle of the common operations: "They take white cloths, and apply to them, not colors, but certain drugs which have the power of absorbing or drinking in color; and in the cloth so operated on there is not the smallest appearance of any dye or tincture. These cloths are then put into a caldron of some coloring matter, scalding hot, and after having remained a time, are withdrawn, all stained and painted

in various hues. This is indeed a wonderful process, seeing that there is in the said caldron only one kind of coloring material; yet from it the cloth acquires this and that color, and the boiling liquor itself also changes according to the quality and nature of the dye-absorbing drugs which were at first laid on the white cloth, and these stains or colors are moreover so firmly fixed as to be incapable of removal by washing. If the scalding liquor were composed of various tinctures and colors, it would, doubtless, have confounded them all in one on the cloth; but here one liquor gives a variety of colors according to the drugs previously applied. The colors of the cloths thus prepared are always more firm and durable than if the cloths were not dipped into the boiling caldron."—In the different countries of India the art is practised with various degrees of skill. In some the patterns are drawn with a pencil upon the fabric; while in Mesopotamia, as stated by Mr. Buckingham, blocks are employed for producing an impression, as practised by the English block-printers. The Chinese also have long used the same process. The large chintz counterpanes, called palampores, of an ancient East India fabric, are prepared by placing on the cloth a pattern of wax and dyeing the parts not so protected. From India it appears the art was introduced at an early period into Europe; but it never became of much importance till some time in the 17th century, when Augsburg, in Bavaria, became celebrated for its printed cottons and linens. From this city the art spread into France, Germany, Switzerland, and Great Britain, being introduced into London about the year 1676. Here, being greatly restricted by the opposition of the silk and woollen weavers, it made but slow progress. In 1720 the wearing of printed calico was prohibited by act of parliament, under a penalty of £5 for each offence on the part of the wearer, and of £30 on that of the seller. In 1730 it was allowed to be printed, provided the warp was of linen, and the web only of cotton; but even then it was subject to an onerous tax of 6d. per square yard. In 1774 the restriction upon the manufacture was repealed; but a tax of 6d. per yard was continued, which was increased in 1806 to 3d. In 1831 this duty was repealed; and the art which had sustained itself under all the attempts to keep it down, now that it was relieved of the burden of paying an average of 50 per cent. on the goods produced for home consumption, suddenly received a great impetus, so that in place of 5,400,000 pieces of goods manufactured in 1830, the production was increased within 20 years to about 20,000,000. The character of the goods was greatly improved, as well as the processes and machinery; while the cost of production was much reduced by the enormous quantities manufactured. The process of printing by wooden blocks, each one of which of a few inches square was applied by hand, impressing the portion of the figure upon its surface in a single color, and another block sub-

sequently applied in the same spot to fill in another portion of the figure in another color—this process was soon nearly superseded by immense machines constructed with the greatest ingenuity, capable of producing 15 or even 20 colors at once with the same precision as in the case of the simpler machines which printed only 2 or 3 colors at once, while at the same time 600 or 700 times as many pieces were produced per day, as if they had been blocked separately with the same number of workmen employed. The progress of this very important branch of the manufactures of Great Britain is elaborately treated in the valuable treatise upon dyeing, in the work on chemistry by Dr. Muspratt. This also contains full and clear details of the numerous processes, chemical and mechanical, applied in conducting this business to its present high state of development. The art, perfected by the highest chemical talent, which has been most liberally directed to improve it, owes its prosperity as well to the ingenuity of the mechanicians who have applied their skill to the construction of its wonderful machinery; while the taste of the artist has contributed its share to give that constantly increasing elegance combined with novelty of pattern to its products, which secures for them the demand essential to the success of the manufacture. It is curious to consider the great variety of taste which the calico printer is obliged to consult. As articles of dress, his goods are to be worn by the half-clothed savage, fond of a display of gaudy colors; they are to please the most refined tastes of the ladies of civilized nations, of those of eastern harems, and of the wives of African kings. Almost every country upon the globe is a customer for these goods, and each demands peculiar styles, patterns, and colors. These, too, must be varied with the seasons, and always present some novelty. For this purpose artists or pattern designers are especially employed, whose constant occupation is to furnish new patterns, from which the printer selects those he judges most likely to be popular. The expense of this branch is to some of the large establishments as much as \$4,000 per annum; agents are employed to collect in France the new patterns as fast as they appear there, and send specimens to their employers. The French artists are admitted to produce finer designs than the English, while the latter nation claims a superiority in the mechanical departments of calico printing. Indeed, the art of designing is stated by the English to have retrograded, the patterns now produced being altogether inferior to those designed many years ago by artists of great merit. The cause of this is very probably the dependence upon the French, and the facility of copying the work of their artists.—The preparatory operations to which the cloth is submitted before printing have been in part described in the articles *CALENDERING* and *BLEACHING*. Printing involves numerous operations of great diversity, of which but a mere outline description

can be attempted in an article of this character. The old method of printing by blocks is still practised in some parts of the process. The cloth is spread upon the surface of a smooth table covered with a blanket, and receives the impression of the figure, or a portion of it, by the application by hand of the block of wood, upon which the pattern is cut in relief. The surface thus printed varies, according to the size of the block, from 9 to 10 inches in length, and from 4 to 7 inches in breadth. The cloth is moved along the table as fast as printed, and the colors transferred from the block dry upon it, as it is suspended in folds upon rollers. The blocks are sometimes made by raising the pattern with slips of copper inserted in the wood, by which they are rendered much more durable, the frequent applications upon the long pieces of cloth soon causing the wooden blocks to lose the distinctness of outline of their designs. Pins in the corners serve to make small holes in the cotton, which mark the points for placing the block the next time. A second or third color is introduced into the pattern by using a second or third block, so engraved as to fill in the vacancies left by the preceding. A modification of the block, called a "toby," has been contrived, by which several colors have been applied at once.—A complicated machine, exhibiting great mechanical ingenuity, was introduced into the French printing establishments in 1834, by M. Perrot, of Rouen, by which the block-printing process was rendered much more expeditious than by the ordinary hand method. It was named for its inventor, the perrotine. Its construction is too complicated to admit of description. As improved in 1844, it printed variously colored patterns on white ground with the utmost delicacy, and with such economy of labor that two men could print in 3 colors from 1,000 to 1,500 yards of calico daily; an amount of work which with the ordinary block would require 25 printers and as many tearers (assistants for keeping the colors in order to be received with every impression upon the block).—Copperplate printing was introduced in the works near London about the year 1770. The designs were cut in the flat plates in intaglio, and the color, applied upon the whole surface, was removed from the smooth portion, leaving it in the sunken parts. The stuff received it from these on being pressed into them by such a press as is used for printing engravings on paper. The change from these flat plates to a cylindrical form introduced the method called cylinder-printing, the greatest improvement that has ever been made in the art, the importance of which can scarcely be overrated. In some of its forms, not the most complete, it is stated that a mile of calico can be printed off with 4 different colors in one hour, and more accurately and with better effect than by hand blocks. One cylinder machine, attended by one man, can perform as much work in the same time as can 100 men with as many assistants. The invention of the machine is

commonly attributed to a calico-printer named Obeckampf, at Jouy, in France, and again to a Scotchman, of the name of Bell, who constructed one about the year 1795. But Dr. Muspratt maintains that the latter only is entitled to the credit of it, and that "cylinder-printing is purely a British invention." The copper cylinders are from 30 to 40 inches in length, and from 4 to 12 in diameter. They are turned from a solid piece of metal bored through the axis, and the pattern is imprinted upon the surface from a steel cylinder called a mill, upon which the pattern is impressed, before the steel is hardened, from another steel cylinder called the die, on which the design has been engraved in intaglio, as the copper finally receives it. The pattern is complete around the circumference of the roller, and each revolution of this exactly repeats it. In the large calico print works, the engraved copper rollers constitute a very important item in the investment of the capital, the value of the stock of these held by some of the larger print houses being rated even as high as \$200,000. The value of a single one is often from \$25 to \$30. These cylinders, one for each color to be applied to the cloth, are set in a strong frame against the face of a large central drum, made of iron and covered with wad-leaf cloth in several folds, between which and the engraving cylinders the calico is printed as it passes. The color is spread upon the rollers by their revolving each one in contact with an attendant roller, which dips into a trough containing the coloring matter or the mordant properly thickened; thus the engraving rollers receive the color, and impart it, as they revolve, to the calico pressed between their face and that of the fixed drum. The superfluous color is taken cleanly off by a sharp blade of steel or other metal, against the edge of which the copper roller scrapes in its revolution. To this contrivance the name of doctor is given. By its use only the color required to fill the depressions is left on the rollers, and the excess falls back into the trough. The employment of many engraving rollers in a single machine is attended with great difficulties, arising from the multiplication of all the other attendant parts in the same proportion. The cylinders have different diameters as the pattern requires, and must, consequently, revolve at different rates of speed. By passing under many rollers, the calico is in danger of being displaced, and the regularity of the print disturbed. But when every thing is exactly adjusted, the work goes on with beautiful precision, accomplishing an extraordinary amount of work. At the Ardwick print works in Manchester is a magnificent machine of this sort, ordinarily working with 18, but capable of printing 20 colors. In the use of the cylinder machine, particular care is required that the colors and mordants should be brought to the proper consistency by a sufficient quantity of the thickener or gum employed, so that they may not spread or run into each other; and that the

selection of these thickeners should be with reference to the chemical effect that may result from their mixture with the colors. The arrangement of the colors, too, in their order of succession, must be with reference to the effect that one may have by coming in contact with the other on the cloth. The reasons in which the operations are conducted require to be kept at a proper degree of humidity and warmth, the success of the delicate processes depending in great measure upon due attention to these particulars. As the cloth leaves the printing machine, it is drawn over rollers through a hot-air chamber, raised to the temperature of about 300°, in which it is thoroughly dried and the colors become set. In some instances, after being thus dried, the cloth is left suspended for 1 or 2 days in what is called the aging room, in order that the mordant exposed to the air should undergo the chemical change which causes it to attach itself permanently to the fabric.—The various methods of preparing and applying the colors and mordants are classed under 6 or more different styles; called, 1, the madder style; 2, the padding style; 3, the topical style, or printing by steam; 4, the resist or reserve style; 5, the discharge style; and 6, the China-blue or pottery style; to which some add the mandarin, in which the color is produced only on silk and woollen fabrics by the action of nitric acid upon the animal tissue. Two or more of these are commonly applied upon the same piece, to produce the various colors of the pattern. Each of them is a complicated process, involving numerous chemical operations, which would require volumes for their full description.—The madder style is like that described by Pliny, quoted above. The coloring matter, which may be madder, or almost any organic dye-stuff capable of imparting its color to water, and forming an insoluble compound with mordants, is not applied to the cloth, but this is printed with the mordant instead, and the color is afterward brought out in the places to which the mordant has been applied, by the ordinary methods of dyeing. By the different engraved rollers, each supplying a different mordant, various shades and colors are afterward brought out by one dye. But before the goods are in a state to receive the dye, it is necessary to remove that portion of the mordant which has not undergone in the drying or ageing that chemical change which renders it insoluble and fixed in the spots to which it is applied. For, if left, it would spread in the dye-bath or vat, and cause the dye to adhere where it should not be seen. From the material used to effect this removal, which is a warm aqueous solution of cow-dung, to which chalk is added if the cloth contains any free acid, the process is called dunging. Solutions of phosphate of soda and phosphate of lime, with a little glue or some other forms of gelatine, thus imitating the composition of cow-dung, are sometimes employed in the want of

the animal product, and are called substitutes. For delicate colors a solution of bran is also used. Not only is the useless portion of the mordant removed by this method, but the material employed as thickening is also dissolved out, and the mordant which remains is the more firmly fixed by uniting with some of the constituents of the dung or of its substitutes. The cloth, after being passed twice through the dung-becks, is several times washed in clean water, and is then ready for dyeing. Upon the care with which the dunging operation has been conducted, the delicate effects to be produced in great measure depend.—The padding style is practised only with mineral colors. A colored ground is obtained by passing the cloth through a tub containing the mordant, and then between 2 rollers covered with blanket-stuff, which press out the superfluous liquid. This is called the padding machine. It next goes through a similar apparatus which furnishes the color. If the object is to obtain a design on a white or colored ground, the cloth may be first mordanted in one padding machine and then printed in the other; or, as commonly practised, be first printed with one of the solutions, and then be padded or winced in the other. Wincing is the passing of goods back and forth a number of times over rollers placed in the dye-becks below the surface of the dyeing liquid.—The topical style, or steam printing, is the application of steam to fix more strongly colors that do not attach themselves firmly to the cloth by being merely printed on together with the mordant. It is called topical from the colors being themselves printed upon the cloth. These are sometimes permanent without the application of steam; and many cheap goods are sold, principally for exportation, in which the fugitive colors, called spirit, fancy, or wash-off colors, are fixed neither by a mordant nor by steaming. Steam not only makes the color more permanent, but gives to it a brilliancy and delicacy of finish. It is applied in a variety of methods—by exposing the goods in a cask, steam-chest, a tight chamber, or receptacle called a lantern, or in that commonly used for calicoes, called the column, to an atmosphere of steam at the temperature of 211° or 212° F. The column consists essentially of a hollow copper cylinder perforated with numerous holes, placed upright in a small apartment furnished with a flue for the exit of steam. Around the cylinder is rolled a piece of blanket, then a piece of white calico, and afterward several pieces of the printed and dried calico. The steam is then let into the cylinder for 30 or 40 minutes.—The resist style is the printing designs with some substance, as oil or a paste, which will protect the portions it covers from receiving any color, and which may subsequently be removed. They may be of a nature to act mechanically or chemically, and designed to resist the action either of a mordant or a color.—The discharge style is producing white or bright figures upon a colored ground, by dissolving out the mordant in goods not yet dyed, or

the dye if this has been first applied, and then printing the portions anew with the hand block. Chlorine and chromic acid are commonly used for removing organic coloring matter, and mordants are dissolved by printing with acid solutions. White figures are thus produced upon the imitation turkey-red bandanna handkerchiefs by letting a solution of chlorine flow through hollow lead types of the form of the figure, the types in 2 corresponding plates, one above and the other underneath, being set in a press which contains a pile of 12 or 14 handkerchiefs. The plates are brought together with a pressure of about 800 tons, and this is sufficient to prevent the chlorine water from bleaching the fabric beyond the limits of the types.—The China-blue style is a method of forming a pattern, partly of white and partly of different shades of blue, by first printing with indigo in its insoluble state; and then reducing this to the soluble state and dissolving it upon the cloth by immersing it in suitable preparations. In this process the dye is transferred into the substance of the fibres, where it is precipitated in the original insoluble form, and of the same variety of shades that were printed upon the goods. It is very curious that in this process the shades when dissolved do not run together, nor even spread upon the portions left white.—Very interesting statistics respecting the production of dyed goods have been collected by Mr. Edmund Potter, reporter for the jury on printed goods in the great exhibition of 1851, and these were made public by him in a lecture the succeeding year, before the society of arts. The immense importance of this branch of manufactures, will justify our giving some space to these details. The annual production of printed cloth in Great Britain, including muslins, de laines, and printed woollens, as well as calicoes, is estimated by Mr. Potter at about 20,000,000 pieces; and in the cotton fabrics about $\frac{1}{4}$ of the whole importation of the raw material is thus consumed. The entire export of manufactured cotton goods, not including yarns, was in the year 1851, 23,447,108 lbs., and about $\frac{1}{4}$ of this is supposed to be printed goods. The following table shows the proportions sent to different countries in 1851:

	Pieces.
Hamburg and north Germany, large portion in transit.....	900,000
Holland.....	360,000
Belgium.....	30,000
Denmark.....	22,000
Sweden and Norway.....	35,000
Russia—Odessa only.....	14,000
France—in transit.....	50,000
Naples and Sicily.....	230,000
Sardinia, Tuscany, Trieste.....	720,000
Turkey, Ionian Isles, Greece, Malta.....	1,440,000
Egypt.....	84,000
Gibraltar and Spain.....	268,000
Portugal and Madeira.....	410,000
Chili and Peru.....	1,010,000
Mexico.....	370,000
Brazil and east coast of South America.....	2,690,000
British West Indies.....	680,000
Foreign West Indies.....	680,000
St. Thomas.....	400,000
British North America.....	470,000
United States.....	1,470,000
India.....	1,570,000

	Value.
China, India, and Singapore.....	\$25,000
Mexico and Barbadoes.....	250,000
Coast of Africa and Cape of Good Hope.....	500,000
Australia.....	200,000
New Zealand and South Sea Islands.....	25,000
California.....	25,000
Total.....	\$1,335,000

The home consumption in 1830 was 2,281,612 pieces; in 1851 it was estimated at 4,500,000, an increase consequent in great measure upon the repeal of the duty. The number of print works in Great Britain and Ireland, in 1851, not including the London district, was 120 in Lancashire, 51 in Scotland, and 1 in Ireland. The great increase of the business in Lancashire for the last 50 years has been by the extension of old establishments, only 1 or 2 print works of great importance having been added in this time, while a greater number of large establishments have been discontinued. The production of France in 1840 was estimated at 4,500,000 pieces. It has since probably increased 1,000,000 pieces. The French production, in consequence of the superior qualities of the goods, ranks next to the English in value, though that of the United States exceeds it in quantity. "The consumption of the United States is more per head for her population than that of any other country in the world; but her printing is more remarkable for mechanical power and speed than for taste; her mode of business, forced in many instances by large capitals on the joint-stock system, varies completely from that of Great Britain. Her cost of production is also much higher from her high-priced labor, coal, and drags. She protects herself with a 20 per cent. duty, and competes with this country only in her own market. The Zollverein, Austria, and Bohemia produce for their own markets, and by their protecting duties prevent any other supply, except of very fine French goods. Their prints are good in execution, imitations of French taste in the finer goods, and of English prints in the medium and lower qualities. Switzerland is very limited but choice in production, and opens her market to the world with a fiscal duty of only 2½ per cent. Holland has a small production of medium goods, and a very moderate protection, not exceeding 5 per cent. Belgium is highly protected, and produces nothing deserving notice in quality. Naples has a few small print works, and high protective duties. Russia produces printed goods of no great character, and her market is prohibited to the British, except the port of Odessa. Spain likewise produces goods of an inferior quality, to a limited extent, and prohibits imports, except in goods of a very fine quality at a duty of 50 per cent. Occasionally a large trade is done in English prints through the smugglers, chiefly from Gibraltar. Portugal produces very slightly, and imports English goods at a duty of about 30 per cent. Turkey produces a few printed goods hardly worthy of criticism. Her duties are light, not above

2 per cent. Egypt has likewise revived the art, and with the assistance of European machinery and workmen produces the readiest possible results; duty as in Turkey. Of the production of all other countries, it may be fairly stated, with the exception of those of China, the East Indies, and the negroes, that they are imitations of either French or English goods, and cannot any of them be said to have a school of their own. The Chinese undoubtedly practised the art of calico printing many centuries before it was known in western Europe, but their productions exhibit a very primitive taste and rude execution. In conclusion, Mr. Potter is inclined to think that the production of Great Britain in printed goods exceeds that of all the rest of the world.—The export of printed cottons from the United States in 1857, amounted to \$1,785,685, of which over \$1,000,000 was from Boston. Imports of the same in 1856, \$12,110,752. The value of calicoes manufactured in Massachusetts in 1855, was \$5,310,000.

CALICUT, a seaport of Malabar, lat. 11° 16' N., long. 75° 50' E. Pop. about 25,000, chiefly Mohammedans. It was the first Indian port visited by Vasco da Gama; was destroyed by Tippon Sah, and the inhabitants removed; but it has risen again under English ascendancy. The name of calico is derived from this town, whence this cotton cloth was first imported.

CALIFORNIA, one of the western states of the American Union, is situated on the Pacific ocean between lat. 32° 30' and 42° N., and long. 114° 20' and 124° 25' W. It is bounded N. by Oregon; E. by the territories of Utah and New Mexico, following the Sierra Nevada on the line of long. 120° W. to lat. 39°, thence S. E. to the river Colorado on the 35th parallel, and thence by the course of that river; S. by the Mexican state of Sonora, or Old California, and W. by the Pacific ocean. The outline of this state is very irregular. Its general direction lengthwise is N. W. and S. E., and a line drawn through its centre, following the curves of its eastern and western boundaries, would measure about 770 m. The greatest breadth of the state is about 350 m. its least breadth 170, and average about 280 m. Its area is estimated at 155,500 sq. m., or 90,520,000 acres.—It is divided into 45 counties, as follows: Alameda, Amador, Innesa Vista, Butte, Calaveras, Colusa, Contra Costa, Del Norte, Eldorado, Fresno, Humboldt, Klamath, Los Angeles, Marin, Mariposa, Mendocino, Merced, Monterey, Napa, Nevada, Placer, Plumas, Sacramento, San Bernardino, San Diego, San Francisco, San Joaquin, San Luis Obispo, San Mateo, Santa Barbara, Santa Clara, Santa Cruz, Shasta, Sierra, Siskiyou, Solano, Sonoma, Stanislaus, Sutter, Tehama, Trinity, Tulare, Tuolumne, Yuba. Of these, 10 have been erected since the state census of 1853.—The state contains 7 incorporated cities, viz.: San Francisco, Sanramento, Marysville, Stockton, Los Angeles, San José, and Benicia. Of these, San Francisco (pop.

in 1852, 34,876, in 1858, 70,000 to 75,000), the commercial capital of the state, situated on a narrow point of land between the magnificent bay of the same name and the Pacific ocean, in lat. $37^{\circ} 47' 35''$ and long. $122^{\circ} 26' 15''$, is the chief city on the Pacific coast. Within the brief space of 10 years it has sprung from the condition of a small village composed of a few adobe houses and a few hundred inhabitants to that of one of the chief commercial centres of the world. Sacramento City, the political capital of the state, and the second city in importance (pop. 25,000 to 30,000) is situated on the Sacramento river, in the county of the same name, about 90 m. in a direct line and 120 by way of the river N. E. from San Francisco. It is a town of much commercial importance, being at the head of navigation for large steamboats, and the interior depot for the gold collected from an extensive mineral region. Marysville (pop. 10,000), in Yuba co., on the Yuba river, near its confluence with Feather river, is a town whose importance arises from the fact of its location at the head of navigation on Feather river (of which the Yuba is a tributary), and its commanding the trade and travel of the northern mines on Feather river and its branches. Stockton (pop. 7,000 to 8,000), in San Joaquin co., is situated at the head of a "slough" about 8 m. distant from the San Joaquin river, and about 100 m. E. from San Francisco by water. It is the chief depot for the southern mines. Los Angeles, in Los Angeles co., near the coast, is the largest town in the southern part of the state, and was originally a mission station; as was also San José, a beautiful town in Santa Clara co., 7 or 8 m. above the head of San Francisco bay, and about 50 m. from San Francisco. San José was at one time the capital of California. Benicia (pop. in 1853 about 2,000, in 1858 about 1,500) was also formerly the capital of the state, and is situated in Solano co., on the strait of Karquenas, which connects San Pablo and Suisun bays; and while it remained the political capital, it was a place of considerable business importance, but has since declined. Nevada (pop. 5,000 to 6,000), the capital of Nevada co., in the northern part of the state, is the largest mining town in the gold region. It is situated on Deer creek, a confluent of the Yuba, at an elevation of about 3,000 feet above the level of the sea. The other principal towns are San Diego, Trinidad, Santa Barbara, San Luis Obispo, Monterey, Santa Cruz, Santa Clara, Vallejo, San Rafael, Sonoma, Napa, Oakland, Mendocino, Humboldt City, and Klamath, all on or near the coast; east of the Coast range, and for the most part among the mines, are Shasta City, Downieville, Grass Valley, Nicolaus, Mokelumne Hill, Sonora, Mariposa, San Bernardino, Visalia, Columbia, Placerville, Coloma, Auburn, and a few others of less importance.—Two enumerations of the population of California have been taken since its acquisition by the United States, those of

the national census of 1850, and the state census of 1852. Owing to the extremely unsettled state of the population, and the isolated position of a large portion of it, the returns are necessarily very imperfect, and such statistics as were collected at the general census of 1850 were mostly destroyed by fire, and consequently never reached the census bureau at Washington. In 1831 the population (Mexican) was estimated at 23,000. By the census of 1850 the number returned was 92,597; by that of 1852, 264,485. In the latter number were included white males, 177,410; white females, 22,198 (a disproportion between males and females which indicates a very anomalous state of society); citizens over 21 years of age, 115,000. The population in 1856, as carefully estimated (in part from actual returns), was 518,380, of whom 217,750 were white male adults, 70,000 women, 44,630 children under 18 years of age, 4,000 colored persons, making a total American population of 336,380. The foreign white population is put down at 67,000, of whom 15,000 are French, 15,000 Mexican, 10,000 Irish, 10,000 German, 2,000 English, and 15,000 of various nationalities, making a total white population of 403,380; to which add 50,000 Chinese and 65,000 Indians, and the grand total is 518,380. Although a very large proportion of the population of California migrated from the other states of the Union, yet almost every nationality in the world has its representatives there; but the most remarkable foreign immigration has been from China. From 1849 to 1857, inclusive, 75,801 Chinese arrived at San Francisco, 18,434 of whom arrived in 1852, and 15,068 in 1854. During the same term 17,524 took their departure, mostly for their fatherland. Allowing 10 per cent. for deaths, there are now about 52,000 Chinese in the state. They are represented as a very quiet, peaceful, orderly, and industrious people, excelling all other classes in these respects. They are divided into 5 companies, each of which protects its own sick and indigent. Members of the same company rarely quarrel, but there are occasional disputes, and have even been pitched battles, in some of the mining districts, between parties belonging to different companies. Their chief occupations are mining, fishing, washing, and trading in such provisions and articles as are in demand among their own people. They have among their number very few mechanics and physicians, and no lawyers nor priests. A Chinese newspaper was published in San Francisco for several years, but has been discontinued. There is a Chinese theatre in San Francisco. The Chinese usually engage in large partnerships to work or trade, 20 or 30 often joining in mining and 6 or 8 in keeping a shop. Very few are employed to work mines owned by Americans, or as servants. As debtors they are said to be very trustworthy, and they generally preserve the style of dress peculiar to their country. They all know how to read their native language, but have few books.

They are believed to have generally belonged to a very low class in China. Of 10 or 15 who attended the missionary schools at Hong Kong, a few are fair English scholars. There are about 4,000 Chinese women in California, most of whom lead abandoned lives. In religion the California Chinese are nominally Buddhists, but have no temple in California. Their chief religious observances are the worship of their ancestors and making offerings at the graves of their deceased friends. Several days of each year are set apart for these offerings. Each company sends all its dead to China. There are perhaps 50 Christian Chinese in the state.—An attempt is making to colonize the Indians in California, and of the 63,000 about 16,000 are on reservations, of which there are 6 in the state, viz.: Tejon, in Los Angeles co.; Nomo Lakes; and Nomo Cult farms, in Tulama; Klamath, in the county of the same name; Mendocino, in Mendocino co.; and King's river farms, in Fresno co. Each of these reservations, except Nomo Cult farm (5,000 acres) and King's river farms (2,000 acres), contains 25,000 acres. On these various reservations 4,100 acres are in cultivation, and the Indians, under the instructions of whites and as wards of the government, are making some advances in agriculture and the arts of civilized life. Mr. Hensley, superintendent of Indian affairs for California, in his report for 1857, says: "That Indians can be collected on reservations and subsisted chiefly by their own labor, the experiments we have already made sufficiently demonstrate." Of those Indians not yet settled on reservations a considerable proportion are in a wild, roving state, and subsist by the chase, while others are scattered among the whites in the settled portions of the state, and, adopting only the vices of civilization, seem to be on the road to rapid extermination.—The Sacramento and San Joaquin are the most important rivers in California, the former having its head springs in Mt. Shasta and its unobstructed spurs in the northern part of the state, and the latter rising in the Tulare lakes on the south; they flow toward each other (the former south and the latter north), draining the great valley to which they jointly give name, until they finally unite near lat. 38°, turn abruptly W., and flow through Suisun bay into the bay of San Francisco. Nearly all the tributaries of these rivers are small, and flow chiefly from the Sierra Nevada, the principal being the Feather (with 3 considerable forks), the Yuba, and the American, flowing into the Sacramento, and the Calaveras, the Stanislaus, the Tuolumne, and the Merced, into the San Joaquin. The Sacramento is about 370 m. long, and is navigable for large steamboats, at all seasons, to Sacramento City, 90 m. from its mouth (or 120 from San Francisco), and for smaller craft to Red Bluff, about 150 or 200 m. above Sacramento City. The San Joaquin is about 350 m. in length, is navigable for ordinary steamers to Stockton, and for small craft, during the rainy season, to

the mouth of the Tulare slough (about 150 m.) through which a canal is now being cut to connect the river with Tulare lake. Kern river, between lat. 33° and 36°, forms the southern boundary of the mining region. The Klamath flows from Oregon through the N. W. corner of the state, with a considerable affluent from the south called the Trinity, and empties into the Pacific. The Salinas, or Descuventura, flowing north into the bay of Monterey, drains the valley between the Moreno and Coast range mountains. The Rio Pajaro, having its outlet near that of the Salinas, and the Eel and Russian rivers on the north, are considerable streams. The Colorado, forming in part the S. E. boundary of the state, is an important river, navigable for vessels drawing 3 feet of water, and is now being explored and surveyed by the U. S. government.—There are 4 ports of entry in California, viz., San Francisco, Sacramento, Benicia, Stockton, Monterey, San Pedro, and San Diego. California has a sea-coast extending the whole length of the state, following the indentations of the coast, somewhat over 700 m. San Francisco bay communicates with the ocean by a strait about a mile wide and 5 m. long, shut in by low mountains on either side, and appropriately named the Golden Gate, since through it flows and retires nearly the whole immense tide of waters for the precious metals, as well as the rich product of their labors. Near the head of this strait, on a peninsula forming the S. W. shore of the bay, is the city of San Francisco. The bay proper is about 60 m. long and 14 wide in the broadest part. At its extremity is the smaller bay of San Pablo, and to the east of the latter that of Suisun, each from 10 to 15 m. square. The other principal bays beginning on the south, are San Diego, Santa Barbara, Monterey, Bodega, and Humboldt, all small and opening into the Pacific.—There are not few islands on the coast, and they are small. On the south are those of Santa Catalina, San Clemente, and several lesser ones belonging to Los Angeles co.; Santa Cruz, Santa Rosa, and San Bernardino, to Santa Barbara co. Some of these are used for sheep grazing, and others are the resort of great numbers of seal, otter, beaver, &c. The Farallones (or needles) are a small group opposite the Golden Gate, on the southernmost of which is a lighthouse of the first order.—There are few lakes worthy of mention in California. The largest is Tulare, in the S. part of the state, which is very shoal. In the wet season it extends to a length of about 100 m., and in very dry seasons is confined to a much smaller compass, and is fordable in nearly all its parts. Owen's and Kern are much smaller lakes in the same region. Mono is a small lake in Mariposa co., east of the Sierra Nevada. The others are Clear lake, in Mendocino co., in the western part of the state, Klamath (lying partly in Oregon), Indian and Goose lakes on the north.—The most striking feature in the physical geography of California is the existence of 3 great ranges of

mountains running N. W. and S. E., and generally parallel, called the Sierra Nevada (snowy range), and the Coast range. The former shoots off from the latter on the S., the snow-capped Mt. San Bernardino, near lat. 34° , long. 117° (said to be 17,000 feet high), being the connecting link. Thence it sweeps N. W. to about lat. $38^{\circ}45'$, long. 120° , whence it extends due N., forming from that point the E. boundary of the state. At the N. end it is again united with the Coast range mountains by a transverse range in which is situated Mt. Shasta, 14,880 feet high, in about lat. $41^{\circ}15'$. The Sierra Nevada is by far the most lofty and rugged range, its summit being generally above the region of perpetual snow, and having but few, and those very elevated passes. Its sides are covered to about half their height with a growth of oak, succeeded by forests of gigantic pine, cedar, and cypress, and these by the naked granite and snow. From its W. slope it sends off numerous spurs into the interior valley; and among these lies the great gold region discovered in 1848. The highest peaks, after those already named, are Mt. St. Joseph, about 10,000 feet; the Butte, 9,000; Table Mountain, 8,000; Saddle, 7,200, &c. The Coast range, as its name indicates, runs along the coast, giving it that rock-bound character so forbidding and dangerous. This range averages from 2,000 to 3,000 feet in height, and is divided in its length by long narrow valleys, the Los Angeles, Salinas, Santa Clara, Sonoma, Napa, and others, and also by the bay of San Francisco. The portion to the E. of this bay is known as the Contra Costa range. The breadth of the coast mountains (from the Pacific to the great valley of the Sacramento and San Joaquin) does not exceed 40 miles in most parts of the entire length of the state. The valleys in the midst of these coast mountains, some of which are 60 miles in length by 10 broad, possess an equable and genial climate. On the S. side of the break caused by San Francisco bay, is Monte Diablo, 3,770 feet high, and on the N. side Table Hill, 2,560 feet high. Beyond this point the range is generally low, but with a few very elevated peaks, as Mt. Ripley, 7,500 feet; Mt. St. John, 8,000 feet; and Mt. Linn, the highest of the range, but whose precise altitude has not yet been determined. The interlocking spurs of the two ranges cover the whole northern end of the state, and give it a very broken and rugged character. The mountains of this range are clothed throughout with luxuriant forests, and contain a great variety of minerals, of which some of the most valuable are found in abundance. Between the Coast range and the ocean occur numerous minor ranges and isolated hills, frequently approaching the water's edge, and enclosing a succession of the most beautiful, salubrious, and fertile valleys. The range of the Sierra Morena, or Brown mountains, on the S., lies between the Pacific and the Salinas or Buena-ventura and San Juan rivers. To the N. the Pacific slope is still more broken with low hills

and mountains.—Between the Sierra Nevada and Coast range lies the great basin bearing the double name of the San Joaquin and Sacramento valleys, although really but one geographical formation. This extends N. and S. about 500 miles, with an average breadth of from 50 to 60 miles, and presents evidences of having once been the bed of a vast lake. At the S. extremity are the Tulare lakes and marshes, which in the wet season cover a large extent of surface. Along the great rivers, the valleys are generally low and level, and extremely fertile, rising into undulating slopes and low hills, as the mountains are approached on either side, and broken on the E. by numerous well-wooded spurs from the Sierra. At the N. end is an elevated plateau, about 100 miles in length, covered with rugged hills. East of the Sierra, in Tulare, San Bernardino, and San Diego cos., is a region little explored, mostly level, much of it sandy and barren, but to a considerable extent well adapted to grazing, and along the Colorado supposed to have a rich alluvial soil.—On the W. side of the Coast range near Bodega bay are found sandstones, clays, talcose slate, and trap rock. The Sacramento valley over the mountain to the E. contains conglomerates and sandstones, and on the western slope of the Sierra Nevada talcose slates again appear, with granite, trap, and serpentine. There is a volcano in Calaveras co., and volcanic vents, surrounded by deposits of sulphur, &c., occur along the coast.—The climate of California, owing to the diversities of surface and other causes, varies greatly in different parts, irrespective of the great range of latitude, $9\frac{1}{2}^{\circ}$, through which the state extends. San Diego in the S. is in about the latitude of Charleston, S. C., and Crescent City in the N. in that of Providence, R. I.; but the climate differs very greatly from that of the Atlantic slope in the same latitudes, and probably from that of any other country in the world. The peculiarities of the California climate generally, as compared with that of the Atlantic states, are, that the winters are comparatively warm; that the rains are confined to winter, and not half so abundant as on the Atlantic coast, the sky clear for $\frac{2}{3}$ of the year, thunder storms rare and never severe, with hail storms in February and March, but never in summer, nights cold even in midsummer, with little difference in the temperature of winter and summer, particularly on the coast from 35° to 40° . Properly speaking, California has several climates; the basin of the Sacramento and San Joaquin valleys having one; the western slope of the Coast range, N. of lat. 35° , another; and that portion of the state S. of 35° still another. The climate W. of the Coast range is different from that E. of the same range, which is less than 60 miles in width. For instance, San Francisco and Stockton are in very nearly the same latitude, one on the coast, and the other in the San Joaquin valley, E. of the Coast range; there is very little difference in the elevation of the 2

place, yet it is stated on very good authority, that during the summer months the mercury ranges about 50° higher at Stockton than at San Francisco. At the latter city the mercury seldom rises above 80° in the dry, or falls below 40° in the wet season. From a weather table kept at San Francisco, from Dec. 1850, to April, 1857, it appears that the greatest degree of cold during that time was 36°, or 7° below the freezing point, which, says the "California Register," "may be set down as nearly the extreme of cold ever felt here." During 3 of the years, 1852, '53, and '56, the mercury did not fall to the freezing point, and in 1853 the lowest point reached was 40°, or 5° above freezing. The extreme of heat, for the same period, was 98° in Sept. 1852, a very unusual temperature for San Francisco. In 1856 the highest temperature was 86°, and in 1851, 84°. Snow very rarely falls in San Francisco, and the winters there are said to bear a strong resemblance to the Indian summer of the Mississippi valley. The mercury seldom, if ever, remains at the freezing point 24 hours together. The mean temperature of spring, summer, autumn, and winter, is 54°, 57°, 56°, and 50°, showing a range of only 7°; and taking the months separately, the range is only 9°, the mean temperature of Sept., the warmest month, being 58°, Jan., the coldest, 49°, and the mean of the year 54°. It is doubtful if any other country in the world has so cool summers and so warm winters, yet there are comparatively great changes in summer days, the mercury sometimes falling to 45° in July, and rising to 87°; indeed, variations of from 20° to 30° during 24 hours are not uncommon. The coolness of the summer nights is attributed to the chilling fogs and winds from the ocean. The wind blows, a part of each day, from the N. and N. W. along the coast nearly the whole year. At San Francisco these winds commence pouring through the Golden Gate toward noon, and increase in violence and chilliness till late at night. Heavy fogs occur during the night in the months of June, July, and August, but are of rare occurrence in winter, when the winds are not so strong. The numerous sheltered valleys near the coast are comparatively free from the annoyance of the winds and fogs, and enjoy a delicious and equable climate. In the interior the extremes are much greater, the mercury in the Sacramento valley often rising in summer to 110° or 112°, and along the Colorado as high as 140°; but owing to the extreme dryness of the atmosphere, this great heat is much less penetrating in its effect than even a considerably lower temperature on the Atlantic side of the continent, and the nights are never so hot as to prevent sleep. In the Sacramento and San Joaquin basins the mean temperature of the winter is about 4° below that of the coast, and the summers are from 20° to 30° above. The greater heat of summer is supposed to result from the absence of the ocean breezes and fogs, and the cold of winter from the proximity to

the snow-capped Sierra Nevada.—California has a rainy and a dry season, the former nearly corresponding to the winter, and the latter to the summer of the Atlantic region. The rains begin at the N. early in autumn, but do not fall in the latitude of San Francisco, in any appreciable quantity, until about the middle of December. For the 7 years from 1850 to 1857 the mean annual fall at that point, during the 6 months from Nov. to April, inclusive, was 20.95 inches, and but 0.23 during the other half of the year. In Jan. 1856, rain fell on 11 days; in Feb., 2; March, 5; April, 5; May, 6; June, July, and Aug., none; Sept., 2; Oct., 6; Nov., 10; Dec., 12; total, 62 days in the year. Snow is very rare on the coast, or in the valleys, and never remains for many days except in the Klamath valley, where there is sometimes a month's sleighing during a winter. There are many mining towns high up in the mountains where the snow falls to a great depth, and lies till late in the spring. During autumn many of the rivers sink in the sand soon after leaving the mountains in which they rise; the plains and hills are baked hard to the depth of many inches; the grass and herbage, except near springs and in swampy ground, are dried up and burned as brown as the earth they grow upon. Earthquake-shocks are quite frequent in California, but rarely so severe as to do any damage. It is said that 20, 50, and 70 years ago, houses were thrown down by them, but nothing of the kind has occurred since the American occupation.—Of the productions of California, gold is beyond comparison the most important; although, were this at once withdrawn, its other resources would render it still one of the richest countries on the globe. Considering the length of time during which the region has been known and partially occupied, the very recent discovery of this great natural wealth is remarkable. So lately as the year 1836, the "Penny Cyclopædia" rated its agricultural capabilities very low, and thus briefly disposed of its mineral resources: "In minerals Upper California is not rich. A small silver mine was found E. of St. Ines, but it has been abandoned. In one of the rivers falling into the southern Tulare lakes gold has been found, but as yet in very small quantity." Eleven years later, however, the discovery of a rich deposit of gold stimulated an eager search, which has ever since been prosecuted with continually widening results, until what is now known as the gold region extends from Oregon in the N. to Kern river on the S., a line nearly 500 miles long by from 10 to 150 m. wide, covering an estimated area of from 11,000 to 15,000 sq. m. In addition to this, rich deposits have recently been discovered on Frazer river, in the British possessions, to which a large emigration is now (Aug. 1859) going on, but which are not yet sufficiently developed to warrant any estimate of their extent. The metal has also been found in various parts of Oregon, and probably the whole range of mountains, from about lat. 50° to 35°, is more or less contain-

ously auriferous. The portion within California lies along the western slopes of the Sierra Nevada; but gold has also been found on the eastern side, and among the mountains of the coast. In the latter, its amount has been supposed to be so small that its production could never become profitable, but recent discoveries in Marin co. (near San Francisco) and elsewhere, indicate the existence of rich auriferous quartz in considerable abundance. Mining is now (1858), successfully carried on in portions of 28 counties; but the proportion of the region actually occupied to that profitably available does not yet, as we infer from the statements of Dr. Traak, state geologist, exceed 4 or 5 per cent. Operations were at first confined to the "diggings," requiring merely manual labor and some simple apparatus for separating the gold from the soil by washing. The gold thus found is generally in a nearly pure state, and in all forms from minute particles to lumps of several ounces and even pounds in weight. This species of industry is still prosecuted with vigor, and in many places deep shafts have been sunk and broad hills tunnelled in search of richer "placers," enterprises often crowned by rich rewards. But the largest deposits are found in the beds of streams, many of which have been turned from their natural channels in the search. Ancient river beds, long since dried up, are also found richly charged with the precious metal. A remarkable vein of some hundreds of feet in width, called the Great Blue Lead, in Sierra co., presents abundant evidences of being such a bed, although it has been traced through the centre of hills, and in places is crossed by large living streams or obliterated by deep ravines. Wherever traced, it is walled in by steep banks of rock, between which are sedimentary deposits of light-blue clay impregnated with arsenic, tightly packed with rounded and polished pebbles and bowlders of quartz, resting on a hard bed-rock worn into long, smooth channels. It contains throughout very large deposits of gold, of which, as in living streams, the finer particles are found at the sides and mingled with the clay, and the heavier and firmer in the centre, resting on the bed-rock. For a distance of 20 m. this bed has been worked, either on the surface or by tunnels through the superimposed hills, and found uniformly presenting the same characteristics. In the dry season the natural supply of water essential to mining is in great part cut off, and for this reason, as well as to render available mining lands at a distance from streams, canals and ditches have been from time to time constructed, amounting in 1857 to 4,405 m., at a cost of \$11,890,800, with about 900 m. more in progress. But the auriferous quartz found throughout the region, and doubtless from the disintegration of which all the deposits of "dust" have been derived, promises to be the most permanent and certainly remunerative source of the precious metal. This occurs in veins and ledges of greater or less extent, and

varies greatly in yield. An average return of \$15 to \$20 per ton is considered profitable, but this is occasionally many times exceeded. The richest veins as yet worked are at Grass Valley, Nevada co. The Allison Ranch vein, in that locality, yields \$800 per ton. The capabilities of this species of mining are as yet but imperfectly developed, since, from the greater outlay of capital and ingenuity required, it is but a few years since it became permanently established; but the abundance of the material would seem to require ages to exhaust it. The rock is crushed in powerful mills, and the gold extracted by amalgamation. Of these mills (the first of which were erected in 1851), there are now (Aug. 1858) in operation 188, of which 86 are propelled by water, 48 by steam, and 4 by horse power, and several more are in course of construction. The aggregate number of stamps used in these mills is 1,521. These mills are situated in 16 different counties, but chiefly in Amador, Calaveras, El Dorado, Mariposa, and Nevada. It is quite impossible to obtain any accurate figures showing the amount of gold taken from the mines. The only records from which an approximate estimate can be made, are the books of the custom-house and the U. S. branch mint at San Francisco, which show the amount shipped according to the manifests of the vessels leaving port, and the amount deposited for assay, coinage, or otherwise. These figures give the following result:

Years.	Shipments.	Deposits.
1849	84,921,250	65,232,949
1850	27,874,846	23,204,256
1851	42,582,695	56,823,990
1852	46,584,184	58,070,675
1853	57,331,024	64,423,295
1854	51,429,093	43,519,053
1855	46,182,681	49,019,945
1856	51,142,263	53,879,901
1857	49,840,186	19,750,000

Total, 9 years..\$874,191,633.....\$885,265,454

What proportion of the shipments had passed through the U. S. mint it is impossible to tell, and how much has been brought away in private hands is unknown. It is estimated that 100,000 miners have returned from California to their homes, each of whom took with him more or less gold, and this added to the quantity manufactured into ornaments must swell very considerably the amount as exhibited by the deposits at the mint. It has been estimated by intelligent persons familiar with the commerce and industry of the state, that the entire gold product of California, since the first discovery of the precious metal, is not less than \$600,000,000.—Nearly all other minerals, as well as gold, are found in California. Of these, quicksilver is the one which has hitherto received most attention. Cinnabar (ore of quicksilver) is found in several localities; but the principal mine yet opened is at New Almaden, Santa Clara co., which is being worked in a very thorough and scientific manner, employing 200 men. The Guadalupe mine, in the same locality, put in operation in 1856 with a force of 100 men, proves very rich. The total

export of quicksilver in the years 1854-5-6, was \$1,510,806. Silver occurs associated with gold and copper in the quartz of the southern district, also with galena and blende; and argentiferous galena is found in the primitive and transition limestones abounding in Monterey co. The amount of silver deposited at the branch mint of San Francisco, in 1855-6, was 212,143.03 ounces. Copper is much more widely distributed than silver, occurring in veins, containing many varieties of ores and some native copper. A vein, strongly impregnated with silver, is profitably worked at Hepe Valley, El Dorado co. Iron ores are found in almost every variety throughout the coast mountains, as well as in some parts of the auriferous district of Mariposa co. Sulphate of iron, or copers, is found in abundance near the town of Santa Cruz. There is also an extensive bed of magnetic iron near the same locality. Platinum appears to be as widely distributed as gold; and Dr. Trask considers it destined ultimately to form a leading element in the commerce of the state. Chrome ores are found in masses and in veins running through serpentine rocks, chiefly among the north-eastern spurs of the Sierra Nevada. The ores of nickel abound in the primitive rocks of the coast mountains, and those of antimony in the Monte Diablo range, the latter containing a considerable quantity of silver. Rich lead ores are found in San Bernardino co. Anthracite is said to occur in San Diego, San Joaquin, Solano, Butte, and other co.; mines have lately been opened in San Diego, which promise a sufficient yield to supply the whole Pacific coast. Very fine qualities of marble, granite, and limestone are widely distributed. Salt is manufactured from a small lake at the Pacific salt works near Los Angeles; there are also numerous small salt lakes and springs at various other points. Asphaltum and sulphur are found on the surface along the southern coast in large quantities. Bismuth, gypsum, and many varieties of precious stones, occur throughout the mountains. Mineral springs of every variety exist; and those in Alameda, Calaveras, Napa, Santa Clara, and Shasta co. are highly esteemed for their medicinal qualities.—The latest estimate of the agricultural capabilities of California gives 41,623,400 acres of land adapted to cultivation; swamp and overflowed lands capable of reclamation, 6,000,000; grazing lands, 30,000,000; total farming lands, 75,623,400 acres, or 119,723 sq. m. This is a much larger proportion of the whole surface than would seem probable, from the great extent covered by mountains; but many portions of these are available for grazing, and they present numerous fertile elevated valleys and plateaus. Captain Wilkes, in 1842, computed the arable land at only 12,000 sq. m., and 10 years later it was estimated at 42,420. The soil of the valleys, both on the coast and in the interior, is generally very rich, producing in abundance all the fruits and cereals of the temperate zone; and in the southern districts

nearly all the most valuable products of the tropics are cultivated with success. The wild oat grows luxuriantly in the Sacramento valley and to the westward. This cereal in the dry season and forms excellent fodder. The average yield of wheat, barley, rye, buckwheat, and beans, is stated at about 30 bushels each; oats, 38; Indian corn, 31; peas, 25; potatoes, in different counties, from 70 to 300. Many districts, however, produce crops very much above these averages; thus of oats and barley, from 50 to 75 bushels to the acre is said to be a common yield, and a field of 83 acres of the former, in Alameda co., averaged 194 bushels in 1853; Indian corn in Alameda, Los Angeles, and Sonoma, averaged nearly 40 bushels; in Sacramento, 60, &c. Successful experiments have been made in the cultivation of cotton, tobacco, sugar-cane, and the mulberry; and incorporated companies have been formed for the cultivation of rice in the marsh lands, which appear to be well adapted thereto, and for the production and manufacture of the sugar-beet in Santa Clara co. The production of fruits, both in variety and amount, is represented as unparalleled. The following enumeration of those of Los Angeles, on the coast, and intersected by lat 34°, will apply equally well to many other counties: apples, apricots, sloes, figs, grapes, lemons, nectarines, oranges, olives, plums, pears, peaches, pomegranates, pineapples, quinces, raspberries, strawberries, and walnuts. The culture of the grape, and manufacture of wine, are fast becoming a leading industrial interest of the state; in the city of Los Angeles alone over 100,000 gallons of wine, of excellent quality, were manufactured in 1855. The amount of land under cultivation in 1856 was 676,959 acres; and the product of the principal staples was as follows: wheat, 8,979,052 bushels; barley, 4,639,078; oats, 1,263,550; potatoes, in 25 counties, 16,484 acres; butter, 424,825 lbs.; cheese, 257,753, &c. Number of fruit trees: apple, 320,509; peach, 619,993; pear, 59,171; cherry, 35,364; all others, 168,861; not specified, 107,994; grape-vines, 1,551,924.—Among the native vegetable productions, there are numerous varieties of trees of great value, some of which attain to an unparalleled size. The most remarkable are the redwood, and the mammoth evergreen coniferous trees of the Linnaea genus *cupressus*, or *taxodium* of later botanists. Redlicher, about 1850, placed the former in a new genus, naming it *sequoia*; and on the discovery of the latter, a few years later, classed it as another species of the same. The mammoth tree (*S. gigantea*, Endl.) became known to botanists about 1853, and was named by some the *Washingtonia gigantea*. It has been found only in small groves on the Sierra Nevada, at a height of about 4,500 feet above the sea level. The first known specimens were a cluster of 92 within a space of 50 acres, in Calaveras co., since become a resort of tourists, and named Big Tree Grove. Four other collections of them have been found, the largest in

Mariposa co., containing 184 trees over 15 feet in diameter, and nearly 800 smaller ones. In all these groves there are many trees from 300 to 400 feet high, from 25 to 34 feet in diameter, and of exceedingly graceful proportions; and some of the largest that have been felled indicate an age, by the ordinary mode of reckoning, of from 2,000 to 3,000 years. The wood closely resembles red cedar, with not quite so even a grain, and is very durable; the bark in some specimens is 18 inches thick, of a stringy, elastic substance, and reddish brown color. Seeds of this tree have been planted in England, the young trees, 3 or 4 feet high, are said to be growing thrifflily, near the level of the sea. The redwood (*S. sempervirens*, Endl.), which bears a strong resemblance to the mammoth tree and is sometimes mistaken for it, frequently grows to a height of 300 feet and a diameter of 15 feet. It is a soft, straight-grained, free-splitting, extremely durable and very valuable wood. This tree is found on the plains or mountains near the ocean, and grows in dense and large groves. The sugar pine (*pinus Lambertiana*) is a magnificent tree in size, and one of the most graceful of the evergreens. It grows about 300 feet high and 12 feet diameter at the base. The wood is free-splitting and valuable for lumber. It grows on the Sierra Nevada. Instead of emitting the resinous substance of the ordinary pine, it furnishes a saccharine sap, which by evaporation becomes granulated and crystallized, and has very much the appearance and taste of common sugar. The Douglas spruce (*pinus Douglasii*), the yellow pine (*pinus brachyptera*), and the white cedar (*libocedrus decurrens*), are all large trees, growing more than 200 feet high and 6 or 8 feet through at the butt. The wood is coarse-grained and is not valuable for joiner-work. The nut-pine (*pinus edulis*), the cones of which contain edible seeds about the size of the kernel of a plum stone, grows on the coast mountains and at the base of the Sierra Nevada, and is of little value. The California white oak is a large, wide-spreading tree with a crooked trunk, and is of no value except for fire-wood. Among the other trees and shrubs found in California, may be mentioned the evergreen oak, the maderone, manzanita, willow, sycamore, bay-tree, cottonwood, horse-chestnut, live oak, spruce, fir, cedar, ash, beech, and other trees of commercial value. The almond grows wild in the coast mountains in Santa Clara co. A wild coffee tree, bearing a berry much resembling the real coffee, grows in Calaveras co. Edible berries of various kinds abound in some portions of the state. There is also a great variety of indigenous grasses. Many species of California trees and shrubs bear a strong resemblance to species found in the Atlantic states and Europe, but they are not the same, and many of the trees of other parts of the continent do not grow in California. The botany of the state generally presents peculiar charac-

teristics, offering a highly interesting field for scientific investigation.—No portion of the world offers better facilities for grazing and wool-growing than a great part of California, and considerable enterprise is already exhibited in that direction. The following is the return of the number of domestic animals for 1856: cattle 684,248, horses 109,991, mules and asses 30,641, sheep 253,812, goats 4,544, swine 186,585, poultry 266,886. The whale fishery is prosecuted to a small extent on the coast. The salmon fishery of the Sacramento river extends over a distance of 50 miles, employing, in 1856, 150 boats, 400 men, and a capital of \$75,000; number taken, about 450,000, averaging about 15 lbs. each; total value estimated at \$84,375. The native quadrupeds of California are numerous, of which the principal are the grizzly and other bears, cougar, wolf, wolverine, wildcat, the coyote (an animal between a fox and a wolf), moose, elk, antelope, mountain sheep, deer, lynx, fox, badger, raccoon, marmot, hare, rabbit, squirrel, &c. Of fur-bearing animals, the sea and land otter, seal, beaver, and muskrat. Of birds, vultures of great size, the golden and bald eagle, turkey buzzard, hawks of various kinds, gerfalcon, owl, raven, shrike, robin, thrush, lark, magpie, jay, woodpecker, humming-bird, swallow, grouse, curlew, goose, duck, penguin, pelican, albatross, and various other game and sea birds. Of fishes, the sturgeon, bass, mackerel, codfish, crawfish, blackfish, clams, oysters, lobsters, crabs, halibut, sharks, trout, salmon trout, smelts, sardines, salmon—the last 2 in sufficient abundance to be articles of export. Horses and cattle roam wild in great numbers over the uncultivated districts, and before the discovery of gold the hides of the latter furnished almost the only article of export.—Perhaps the most wonderful of the many remarkable natural curiosities of California is the Yosemite valley or dell, with its surrounding cascades and mountain peaks. The name of this valley is sometimes written Yo Hanity and Yohamite; but Yosemite is the orthography more generally adopted. It is described by writers who have recently visited it as possessing scenery unmatched for wild and romantic beauty and sublime grandeur. Its course is nearly east and west. It is about 10 miles long and nearly 8 miles wide in the centre, from which it decreases in width each way. It is bounded on all sides by walls of yellowish granite from 2,000 to 4,500 feet high, generally very precipitous, and in places perpendicular, so that the valley is accessible only from the ends; and here within a radius of 5 or 6 miles are 5 cascades ranging from 350 to 2,000 feet in height, and as many rocky mountain peaks whose height ranges from 2,900 to 4,480 feet. "The valley," says a recent visitor, "is a cleft in the Sierra Nevada, watered by the main fork of the Merced river, which, above and below, makes its way through the mountains in deep and dark gorges, scarcely getting a glimpse

of sunlight except when it passes through the Yosemite meadow." The scenery from the ridge overlooking the valley is represented as magnificent. Entering at the western end, the dell is reached by a circuitous and precipitous descent of 2,500 feet, new and beautiful views presenting themselves every few minutes. The valley is mainly a level sward of luxuriant grass intermixed with ferns and bright flowers, with here and there a few oak, pine, and other trees. A small creek about 70 feet wide empties itself over the S. wall of the valley 940 feet perpendicularly, forming the Rainbow cascade, so called from the beautiful rainbow colors which adorn the mist floating about it. On the N. side of the valley, nearly opposite and about $\frac{1}{2}$ of a mile distant, stands "the Captain," a rock projecting into the valley, and rising up perpendicularly 3,000 feet. A little further E., on the same side of the valley, stands Signal rock, whose peak is 2,025 feet high. Four miles above the Rainbow, on the N. side, are the falls of the Yosemite. Here the creek leaps down 2,065 feet in 3 falls, the 1st being about 1,300 feet, the 2d 250, and the 3d about 450. So far as height is concerned, the Yosemite, sometimes called by the Indians the fall of Chohock, is no doubt the most extensive waterfall yet discovered; but from the limited volume of the stream it is said to be less impressive to the beholder than Niagara. As seen from a distance it is said to resemble somewhat a great sheet of white satin hanging over the cliff. On the S. side of the valley, opposite the Yosemite fall, stands Pyramid rock, 3,200 feet high, a peak which receives its name from its peculiar shape. Three miles further up, near the head of the valley, is Lake Mirror, a beautiful body of water containing about 8 acres; and on the N. side of this lake stands a huge rock called the North Dome, 2,630 feet high, and surmounted by a dome-like knob. On the S. side, standing a little back from the lake, is the South Dome, which towers high above all its fellows, rising up perpendicularly on its northern face 4,481 feet. "Its abruptness," says an eye-witness, "is almost inconceivable, and its grandeur indescribable." The S. fork of the Merced comes down through a gorge and empties into the valley on the S. side. Up this gorge, which is ascended with great difficulty, about one mile from the dell is the Vernal or Canopah fall, where the Merced, about 100 feet wide, falls 350 feet into a basin surrounded by large evergreen trees. Half a mile further up this stream is the Nevada or Awanco fall, about 700 feet high, for half of which distance the water falls in a perpendicular sheet, when it strikes a steep cliff which breaks it into a snowy, feathery spray, whence it leaps down to the bottom. About 2 m. W. from the Nevada fall is another cascade called the Tuoyee fall, about 500 feet high, and exceedingly difficult of access. "No description," says the tourist already quoted, "can convey a clear idea of the great variety of

scenery in the valley. There are a thousand nooks and corners and woody dells, every one of which is full of enchanting picturesqueness. The rocky cliffs take all manner of queer forms, sometimes resembling pyramids and cones; again resembling castles, domes, chimneys, and spires. In one place there is a narrow cleft several hundred feet deep in one of the rocks, as though some giant had commenced to split off a part of the mountain, and had left his work unfinished." The valley is not inhabited. A few years ago it was the home of a small band of warlike Indians, but they have all disappeared. It is understood that it will be settled soon, and that houses of entertainment will be erected for the accommodation of tourists, for whom it may yet become a famous place of resort. The valley was first entered by a white man in 1848, and afterward at various times from 1850 to 1852; but it attracted no notice from the press till 1854, and did not become a place of resort till 1856.—The geysers of Napa co., about 60 miles north of Napa City, are also remarkable natural phenomena. They are a collection of hot sulphur springs, the water of which is continually in a boiling state, and is in several places thrown into the air to a height of 10 or 15 feet. Hundreds of fissures in the sides of the mountains emit strong currents of heated gas, accompanied by a roaring noise, as of the blowing off of steam from an immense boiler. "Beneath your footsteps," says Prof. Sheppard, "you hear the lashing and foaming gyration, and on cutting through the surface are disclosed streams of angry, boiling water." The Betties are a small detached range of mountains in Sutter co., about 12 m. in length by 6 in breadth, and containing perhaps 20 peaks; the highest of which, and the most interesting, is that on the N., which is a very steep cone, surmounted by a turret-shaped rock 35 feet high, and has an elevation of 2,483 feet. This commands an extensive view from the Coast range to the Sierra Nevada, and for perhaps 80 m. up and down the Sacramento. In Calaveras co. are 3 natural bridges across the Chiyote creek, near Vallecita—immense arches, their surface appearing as if carved into clusters of fruits and flowers, doubtless the result of volcanic action. The Chiyote cave, in the same locality, is entered by a perpendicular descent of 100 feet; thence it proceeds by a gradual slope to a depth of nearly 200 feet, where is a chamber containing 3 stones resembling bells, which, when struck, emit a chiming sound, whence the apartment has been named the Cathedral. Descending another slope of 100 feet, a lake is reached of great depth and apparently covering many acres, beyond which the cave has not been explored. The mammoth-tree groves, elsewhere mentioned, are entitled to be ranked among the most attractive of natural curiosities. From its great diversities of surface and general physical peculiarities, California presents innumerable examples of picturesque scenery and ob-

jects of interest to devotees of nature and of scientific research.—The industrial interests of the state, of course, centre in the gold mines, in which probably one-half the entire population are employed. In connection with this department of industry there is a branch of the U. S. mint at San Francisco, put in operation in April, 1854, at which there had been coined up to Jan. 1, 1857, \$58,266,737 in gold, and \$378,568 in silver, beside large amounts of both assayed and run into bars. There are several private establishments for the assaying and refining of gold and other metals, and the extraction of gold from the "tailings" of quartz, or such as, from the admixture of extraneous substances, cannot be reduced by amalgamation at the quartz mills. Manufacturing industry has hitherto been confined to those departments required by the more pressing local wants, but in some of these great enterprise and activity are being developed. During the first years of the settlement the neglect of agriculture necessitated an almost entire dependence on importation for bread-stuffs, and even vegetables, and the price of flour frequently ranged from \$20 to \$30 and \$40 per barrel. Already, however, the case has been reversed, and flour has become a staple export. There are 131 grist mills, 67 propelled by steam and 64 by water power, with 270 run of stone, erected at an estimated cost of \$2,400,000, and capable of producing 2,174,960 barrels of flour per annum, several times the quantity necessary for home consumption. The manufacture of lumber is also an important branch of industry and of commerce. There are 278 saw-mills, 171 propelled by steam and 209 by water; estimated cost, \$2,500,000; aggregate capacity, about 500,000,000 feet per annum. The most extensive lumber district is the vicinity of Humboldt bay, in the N. W., whence the export trade is mainly supplied. There are 14 iron founderies and machine shops, adapted to the manufacture of all kinds of steam and other machinery, and of a capacity to supply all demands; 18 tanneries; an extensive sugar refinery at San Francisco, employing 150 hands, and supplied with raw material by a special line of clipper barks from Manila, Batavia, and other Pacific ports; a cordage and oakum manufactory at the same place, on the largest scale; a large paper-mill in Marin co.; 4 large distilleries and 104 breweries, but most of the latter are small local establishments. The trade and travel between San Francisco and the interior are carried on by steamers of large size to Sacramento and Stockton, and by smaller ones beyond those points, all of which have been built in the state. Ocean ship-building is also beginning to be prosecuted to some extent at San Francisco. The U. S. government has a navy yard at Mare island, San Francisco bay, the only one on the Pacific coast, which, if completed on the scale projected, will cost \$15,000,000 or \$20,000,000, and be one of the most commodious in the world. It already affords conveniences for all necessary docking

and repairs both of the naval and merchant marine.—The commerce of California is mainly carried on through the port of San Francisco, which ranks as the 4th city in the Union in point of commercial importance. Its trade employs a large number of ocean steamers of from 900 to 3,000 tons burden, connecting with the Atlantic by railway via the isthmus of Panama, and by land and water transit through Nicaragua. Beside these steamers, multitudes of sailing vessels of all descriptions arrive and depart daily. In 1852 there arrived 718 vessels with a tonnage of 261,352, and cleared 906, tonnage 860,872, about $\frac{1}{4}$ of which were foreign. The tonnage for the year ending June 30, 1857, was as follows: arrivals, domestic, 102,639 tons; foreign, 46,603—total, 149,242; departures, domestic, 213,834; foreign, 48,917—total, 262,751. Of American cities, only New York, Boston, and New Orleans exceeded this amount. Number of passengers arrived at San Francisco from April, 1849, to December, 1856, 360,118; excess of arrivals over departures from 1852 to 1856, 82,969. The foreign imports of 1856 amounted to \$9,155,501; duties, \$1,875,108. Total duties collected from 1848 to Dec. 31, 1856, 8 $\frac{1}{2}$ years, \$15,485,766. The exports of the chief articles of domestic produce, other than gold, in 1856, were as follows: flour, \$765,212; oats and barley, \$24,646 (1855, \$182,807); potatoes, \$1,292 (1855, \$26,712); wheat, \$66,370 (1855, \$92,686); tallow, \$67,661; lumber, \$48,818; quicksilver, \$795,898, &c.; total exports, \$1,782,608, not including a considerable amount of hides, of which the value is not returned, and a few minor articles.—But one railroad has yet been built, from Sacramento to Folsom, 22 $\frac{1}{2}$ miles, which was opened Feb. 22, 1856; cost of construction, \$1,200,000. This road has been eminently successful since its opening, and it is designed to extend it to several of the interior towns, arrangements being now in progress for a northern branch to Marysville or Oroville. Wagon roads have been constructed from Sacramento, Marysville, Stockton, &c. to the principal points in the mining region; that from Stockton connects with the military road from San Bernardino to Salt Lake City, a distance altogether of 1,100 miles. There are 2 lines of magnetic telegraph in operation, with an aggregate communication of 560 miles. The canals and ditches for mining purposes have been elsewhere mentioned. For a railroad connecting California directly with the Atlantic states, 5 or 6 different routes have been surveyed or explored, averaging over 2,000 m. in length, and varying in estimated cost from \$94,000,000 to \$170,000,000. Congress has made a liberal appropriation for the construction of two wagon roads adapted to the conveyance of mails and passengers, which are in progress, and a through mail is already in operation over the route terminating at San Diego. A through line of magnetic telegraph is also in immediate con-

completion.—A state insane asylum was established at Stockton, by act of the legislature, in 1853; the buildings are commodious and well arranged, with 100 acres of ground handsomely laid out; on the 1st of January, 1857, there were 173 patients—122 males and 50 females; expenditures for the year, \$180,745. There is a U. S. marine hospital at San Francisco, the building for which cost \$224,060, and is capable of accommodating 800 patients; number treated during 1856, 1,388, of whom 48 died, and 165 remained on Jan. 1, 1857; expenditures for the year, \$48,774. There is also a hospital fund provided by the state, which is apportioned to the different counties, and expended by the boards of supervisors for the support of the indigent sick; the expenditures from this fund for 4 years ending June 30, 1856, were \$1,065,462, of which \$141,163 was disbursed in the year 1855-'6; the supervisors are authorized, when necessary, to levy in addition a special local tax for the same purpose. The state prison is located at St. Quentin, Marin co., 12 miles from San Francisco; the number of convicts, Jan. 27, 1856, was 475. Of public libraries, that of the state at Sacramento has 11,000 volumes; Santa Clara college, San José, 10,000; mercantile association, San Francisco, 8,000; 10 others at San Francisco, 13,750; 5 in other places, 5,250, beside several whose numbers are not given.—Liberal provisions have been made for education, although the number of youth is, as yet, extremely small in comparison with other communities. In 1851 the legislature, in compliance with a provision of the constitution, passed an act establishing a system of public schools; but very few schools were established in the state previous to 1851, and even then, with a population of 800,000, there were only 53 public schools in the state. The following table will show the development of the system since that time:

Year.	Number of children.	Daily average attendance.	No. of scholars.	No. of teachers.	Amount of state school fund disbursed.
1853.....	71,571	—	79	54	\$6,315 11
1854.....	79,478	—	108	214	\$9,184 73
1855.....	106,972	8,425	227	301	\$2,327 81
1856.....	130,682	8,611	313	393	\$1,014 83
1857.....	165,728	9,717	357	456	\$5,283 82

In 1854, 16 of the 45 county superintendents in the state failed to report; in '54, 7; in '55, 3; in '56, 2; and in '57, only 1 failed to make returns. The 500,000 acres of land given to the state on her admission into the Union, for purposes of internal improvement, were transferred to the school-fund. The 10th and 80th land sections (640 acres each) of every township granted by congress to support common schools amount to about 6,000,000 acres in the state, and with other special donations, including 72 sections for a state university, not yet organized, the school lands amount to 6,800,000 acres, or 10,635 sq. m. The formation of a school fund has been commenced by the sale

of about 235,000 acres of these lands, netting \$405,000, to be increased by the proceeds of the remainder as sold, which is invested in bonds of the civil funded debt of the state, bearing 7 per cent. interest. To the income of this fund is added $\frac{1}{2}$ of the receipts from poll-taxes, and the proceeds (when there shall be any) of the sales of all escheated estates. In addition to these resources, the counties are authorized to levy a special tax, from which a considerable amount is raised. The amount appropriated for school purposes in 1855 was \$150,977 09, of which \$82,014 80 was from the state, and \$68,962 29 from the county funds. No public money is paid to denominational schools. In San Francisco, Sacramento, and several of the larger towns, the public schools are entirely free; but in other districts deficiencies in the public fund are made up by the patrons of the schools. A state superintendent of public schools is elected by the people for a term of three years, with whom are associated the governor and surveyor-general to form a state board of education. There are also county superintendents and district trustees. The enumeration of the children for school purposes includes those between the ages of 4 and 18 years. The salaries of male teachers in the public schools range from \$95 to \$180 per month, and of female teachers from \$50 to \$100 per month, the highest salaries being paid in San Francisco. The schools of San Francisco and Sacramento are said to be very good, while those in the mining districts are about equal to the common schools of the western states. There are many schools not supported by government, which are attended probably by 3,000 pupils during 10 months of the year. Among these schools, the most prominent are the Jesuit high school for boys in Santa Clara, and the seminaries for young ladies kept by the Catholic order of the sisters of mercy in San José and Benicia. There are 3 incorporated colleges in Santa Clara co., viz., the Santa Clara college, founded by the Jesuits in 1851, on the site of the old mission, with 113 pupils, and a library of 10,000 volumes, containing many rare and valuable works; and the university of the Pacific, founded by the Methodist Episcopal church in the same year, comprising male and female departments, with 90 students in the former and 50 in the latter. There are 120 newspapers and periodicals published in the state, of which 27 are issued daily, 72 weekly, 16 semi-monthly, 4 monthly, and 3 quarterly; of these, 7 are in foreign languages, 2 French, 2 German, and 2 Spanish; 82 are issued at San Francisco, 7 at Sacramento, 5 at Marysville, and 3 at Stockton; their aggregate annual issue is estimated at 18,250,000 sheets; 14 counties have no papers.—It is quite impossible to obtain full statistics of the various religious denominations and societies in California. There are a great many scattered churches which have no connection with other associa-

tions of the same kind, and there are several sects with a number of churches whose statistics have never been compiled by themselves. The attainable church statistics of the state are as follows:

Denominations.	Communicants.	Churches.	Clergy-men.
Methodist North.....	2,500	53	63
Methodist South.....	1,500	20	40
Presbyterian, Old School...	1,000	15	17
Presbyterian, New School...	500	11	18
Congregationalist.....	600	11	19
Baptist.....	1,000	42	90
Episcopal.....	350	18	15
Unitarian.....	70	1	1
Total Protestant.....	7,520	176	180
Catholic.....	80,000	66	69
Hebrew.....	10,000	8	1
Total.....	97,520	245	250

The Cumberland Presbyterians and Campbellite Baptists have each a number of congregations in the state. The estimate of Catholics includes all who attend the Catholic churches and their children; and the estimate of the number of Hebrews includes all of Jewish blood, many of whom neglect the observances of their church. There is but 1 regularly ordained rabbi in the state, but a number occasionally officiate as such. It is estimated by intelligent residents of California that at least $\frac{1}{4}$ of the population of the state are Protestant by education and sympathy, though not by church membership. The average attendance at the Protestant churches is said to be 5 or 6 times greater than the number of communicants; and the number of congregations who occasionally meet for worship far exceeds the number of church buildings. The Chinese, mentioned elsewhere, are nearly all Buddhists. The Indians, with very few exceptions, are destitute of any creed beyond a vague belief in the Great Spirit and unseen powers, and a profound reverence for their medicine men.—The constitution of California is similar in its general features to those of the older members of the confederacy, although differing from many of them in some of its details. By its provisions, all legal distinctions between individuals on religious grounds are prohibited; the utmost freedom of assembling, of speech, and of the press is secured, subject only to restraint for abuse, and in trials for libel proof of the truth of the charge and of good intentions is a bar to damages, the jury deciding upon the law and the fact; foreigners who are *bona fide* residents are secured the same rights in respect to property as native-born citizens; there is to be no imprisonment for debt, except in cases of fraud; slavery and involuntary servitude, except for crime, are expressly prohibited; wives are secured in their separate rights of property, independent of their husbands' control; a certain portion of the homestead and other property of heads of families is to be secured by law from forced sale. Among the restrictions on legislation are the following: No public debt shall be created exceeding at

any time the sum of \$800,000, except upon a specific vote of the people, and then within certain prescribed limits; no divorce shall be granted by the legislature; lotteries and the sale of lottery tickets shall not be allowed; corporations or joint-stock companies may be formed under general laws, but shall not be created by special acts, and the members thereof shall be individually liable for corporate debts; no charter for banking purposes shall be granted, and the circulation of paper money in any form is prohibited; the credit of the state shall not be loaned to any individual or corporation, nor shall the state directly or indirectly become a stockholder in any corporation. The right of suffrage is conferred on all citizens 21 years of age, not convicted of crime or idiotic, resident 6 months in the state and 30 days in the county or district. The legislative department consists of a senate elected for 2 years, and an assembly for 1, the former consisting at present of 33 and the latter of 80 members. All citizens resident 1 year in the state, and 6 months in the district, are eligible to membership. The executive department consists of a governor, lieutenant-governor, comptroller, treasurer, attorney-general, surveyor-general, and superintendent of public instruction, chosen by the people, the last for 3 and the others for 2 years, and a secretary of state appointed by the governor and legislature. The qualification of all for eligibility is an age of 25 years or over, and a citizenship and residence in the state of 2 years. The judiciary consists of a supreme court with 3 justices, elected by the people for 6 years, having appellate jurisdiction in civil cases where the amount in dispute exceeds \$200, in questions of the legality of taxes, &c., and in criminal cases amounting to felony; district courts (now 15 in number), with 1 judge each, elected for 6 years, having original jurisdiction in law and equity in civil cases where the amount exceeds \$200, and unlimited jurisdiction in all criminal cases not otherwise provided for, and in issues of fact joined in probate courts; county courts, consisting of 1 judge in each county, elected for 4 years, who performs the duties of surrogate or probate judge, and, with 2 justices of the peace, holds courts of special sessions; and such a number of justices of the peace in each county, town, city, or village, and with such powers, as the legislature may direct. Salaries are fixed as follows by act of April, 1856, being in most cases reductions from former rates: governor, \$6,000; comptroller, treasurer, superintendent of public instruction, and secretary of state, each \$3,500; surveyor-general and attorney-general, each \$2,000; supreme court judges, \$6,000; district judges, from \$3,000 to \$5,000; presiding officers of the legislature, \$12 per diem, members \$10 for the first 90 days and \$5 thereafter, and mileage at the rate of \$4 for every 20 miles travelled.—Revenue (exclusive of that for school purposes) is raised by taxation upon real and personal property, which yielded in 1856, \$656,315 45, at the rate of 70

cents on \$100, the total assessed valuation being \$95,007,440 97; by a poll-tax of \$3 on every resident between the ages of 21 and 50; and by a small license tax on merchants, bankers, places of amusement, foreign miners, &c. The receipts and disbursement of the state, from 1855 to 1857 inclusive, were as follows:

Year.	Receipts.	Disbursements.
1855.....	\$1,155,537 10.....	\$1,837,496 64
1856.....	723,839 83.....	1,368,684 81
1857.....	1,152,284 00.....	699,908 00

The receipts for 1857 were from the following sources: property tax, \$695,749 95; poll tax, \$75,027 43; foreign miners' licenses, \$154,660 53; trade licenses, &c., \$226,796 04. The debt of the state in March, 1858, was as follows:

Bonds of 1850, 8 per cent. interest with interest.....	\$6,888 95
" " 1850, 7 per cent. due 1860.....	150,000 00
" " 1853, " " " 1870.....	1,859,600 00
" " 1855, " " " ".....	700,000 00
" " 1856, " " " " 1875.....	924,000 00
Indian war debt.....	218,020 91
Debt due by state to school fund.....	464,000 00
Outstanding comptroller's warrants.....	404,447 12

Total debt of the state.....\$4,310,956 98

The state government commenced its functions under very unfavorable financial circumstances. The expenditures of every branch of the administration were enormous, and there was very little real property held under secure title, and a small permanent population from which to draw revenue. The consequence was resort to the credit system. The emission of paper money in the form of bonds and warrants, which could only be converted into cash at a heavy discount, considerably increased the expenditure of the government. The state constitution had provided that the legislature, after its first session, should create no debt greater than \$300,000 unless sanctioned by a popular vote of the people. None of the debts before mentioned were submitted to the people, and the supreme court decided in one case that the want of that authority for a debt created after 1850 rendered the legislation whereby it was created unconstitutional; and the court intimated that all the debts created after 1850 were illegal. In the autumn of 1857 the people by a popular vote decided that all the state debts should be paid, 57,661 voting in favor of payment, and 16,970 for repudiation. During the year 1857 the receipts into the treasury for the first time exceeded the disbursements, and on Jan. 1, 1858, there was a surplus of \$450,000 in the treasury. In addition to the state debt, the cities have outstanding bonds (in 1857) to the amount of \$5,668,903, and various counties \$2,365,260, which added to the debt of the state makes the whole public indebtedness of California \$12,163,090. The state owns the tide lands, being that portion covered by water from high-water mark to the channels of bays and rivers, and 3 m. into the ocean; also the swamp and overflowed lands of the state, amounting to about 5,000,000 acres.—The etymology of the name California, according to the annals of San Francisco, is uncertain; some writers have asserted that it comes from the

Latin words *calida* and *fornax*, Spanish *caliente fornalla*, a hot furnace—while others of high authority question this origin of the word. Other Latin derivations have also been suggested, but for the most part with little plausibility. It is probably a corruption of the original Indian name. The name California is first found in the writings of Bernal Diaz del Castillo, an officer who served under Cortes in the conquest of Mexico, and by him limited to a single bay on the coast. In some of the early English maps California is called New Albion, having been so named by Sir Francis Drake, who touched on the coast during one of his buccaneering expeditions in 1579. A century later it was called *Islas Carolinas* (supposed then to be an island), in honor of Charles II. of Spain; but subsequently the original name was revived and universally adopted. Lower or Old California was discovered as early as 1534 by Zimenes, a Spanish explorer; but the first settlements were made much later, in 1683, by the Jesuit missionaries. The precise date of the discovery of New or Upper California is uncertain; but it was subsequent to that of Old California, and the first mission (San Diego) was founded as late as 1769. Other missions and presidios were established in the following years, and the government of the country, both spiritual and temporal, was intrusted to certain monks of the order of St. Francis. The bay of San Francisco was discovered about 1770, and a mission was established there in 1776. In 1803, according to Humboldt, 18 missions had been established with 15,562 converts. Three more missions were subsequently established, and in 1831 the entire population is stated by Forbes in his history of Upper California at 23,025 (exclusive of unconverted Indians), of whom 13,683 were Indian converts. The same writer infers that for several years thereafter the population remained stationary. It seems to have been the policy of the ecclesiastical rulers to prevent the settlement of the country as far as possible, deeming such course best calculated to advance the object they had in view, viz., the conversion of the savages. The produce of the country in 1831 was, wheat 62,860 bushels, Indian corn 27,316, barley 18,512, beans and peas, 6,816, the entire crop being valued at \$86,284. Of domestic animals, there were 216,727 cattle, 32,201 horses, 3,021 mules and asses, 153,455 sheep, and 2,712 goats and swine. There were at the same time many wild cattle and horses in the country. At this date a good mule or saddle horse was worth \$10; a mare, cow, or fat ox, \$5; a sheep, \$2. The missions had been declining in wealth and power since 1824, in consequence of the interference of the Mexican government with the vested rights of the fathers, which finally resulted in the practical confiscation of the church property. The following statistics of the missions during the period of their greatest prosperity, are collected from the Rev. Calvin Colton's "Three Years in California":

Missions.	Cattle.	Horses.	Sheep.	Mules.	Hogs.	Marche's and Specie.
San Francisco	8,050	8,084	79,000	890	2,000	\$60,000
Dolores.....	97,037	5,840	89,000	790	1,000	190,000

In addition to these missions, there were Santa Inez, possessing property valued at \$800,000, and San Juan Capistrano and San Diego, which were reputed to be among the most opulent of the missions. The Spanish power in California was overthrown by the Mexican revolution in 1822, and though the government of that country changed frequently, all administrations agreed in the policy of secularizing the government of California, and the fathers were finally stripped of their possessions and their former dignity and influence. The centralization of power at the federal capital, under the first administration of Santa Anna, caused a rebellion in California which resulted in the expulsion of the federal officials, and a declaration of independence on the part of the Californians; but in the following year, when the excitement had subsided, the people came back to their allegiance, and quietly submitted to the new order of things. The settlement of the country began to advance, particularly from the immigration of foreigners, the people of the United States being largely represented. In 1842, Com. Jones, of the U. S. navy, under the impression that the United States were at war with Mexico, took forcible possession of Monterey, hoisted the stars and stripes, and proclaimed California U. S. territory. Discovering his mistake the following day, he hauled down his flag, and made such apology as the circumstances would admit. During the years 1843, '44, '45, and '46 many thousands of emigrants from the United States settled in California; and while the country was rapidly becoming Americanized, in April, 1846, war was declared between Mexico and the United States; but before the news of this event had reached California, a quarrel arose between the Mexican officials and the American settlers, in which the Mexican commander attempted to expel the settlers from the country. This resulted in quite a general uprising of the Americans, a declaration of independence, and an active and energetic warfare against the Mexican authorities, which, under the lead of Col. John C. Fremont,

by a few rapid and bold movements, had nearly subdued the country, when, July 7, Com. Sloat, of the U. S. navy, arrived at Monterey, with intelligence of the declaration of war, and with assistance to the American cause. A few days later, Com. Stockton arrived with additional assistance, took command of the American forces, and at the head of about 800 men marched on the capital, Los Angeles, which he took without firing a gun. Gen. Castro with a greatly superior force having fled to Sonora on his approach. Stockton proclaimed California a territory of the United States, proceeded to establish a provisional government, and the country was apparently conquered; but the Mexican forces subsequently rallied under Gen. Flores, recaptured Los Angeles and Santa Barbara, which were not strongly garrisoned, and met with some other slight temporary successes. Stockton again collected his forces, and marched against Flores, whom he defeated, with very slight loss on the American side, in 2 battles, at Rio San Gabriel, Jan. 8, and on the plains of the Mesa, Jan. 9, 1847, which practically terminated the struggle for the mastery in California. The treaty of peace soon followed, by which California and certain other territory were ceded to the United States for the sum of \$15,000,000. At the close of hostilities the white population was estimated at 12,000 to 15,000. In the month of Feb. 1848, gold was discovered on the property of Col. Sutter, in Coloma county. The news spread rapidly. Men left their business of all kinds, and rushed to the locality of the new Ophir, and it was soon found that gold was widely distributed throughout the state. People flocked in from Mexico, from South America, from the Atlantic states, from Europe, and from China. The emigration was altogether unparalleled. In a very short time California contained a mixed population of nearly a quarter of a million of energetic, daring, reckless, and dangerous people. A substantial government became necessary. Gen. Riley, the military governor of the territory, called a convention of delegates, to meet at Monterey, Sept. 1, 1849, to frame a state constitution. The convention met, and after about 6 weeks' consideration, agreed on a constitution, which was submitted to the people, by whom it was adopted, and on Sept. 9, 1850, California was admitted into the union of American states by act of congress.—Gambling became almost a universal passion among the Californians. Whole squares were devoted exclusively to it in San Francisco, and it is said that as high as \$20,000 have been risked on the turn of a card, and \$5,000, \$3,000, \$2,000, and \$1,000 were repeatedly ventured; fortunes were lost and won in a few minutes with a coolness that amounted almost to indifference. Prices for all sorts of goods and services rose to fabulous figures. The smallest change used was quarter dollars, and no service was rendered for less than 50 cents. Admission to the circus ranged from \$3 for a seat in the pit, to \$55 for

a private box. Board was \$5 per day, or \$50 per week, the most indifferent being \$20. Flour and pork rose to \$40 per bushel; potatoes and brown sugar 97½ cents per lb., and other necessaries in proportion; common coarse boots, \$90 to \$40 per pair, and superior high-tipped boots, \$100. Laborers' wages were \$1 per hour, and skilled mechanics' from \$12 to \$20 per day. Lumber rose to \$500 per 1,000 feet. Rents were correspondingly high: a 2-story frame building, known as the Parker House, rental for \$120,000 per annum, ¼ of which was paid by gamblers, who occupied nearly the entire 2d story; \$5,000 per month was paid for a single store of limited dimensions, and rotely constructed of rough boards; the El Dorado, a canvas tent of moderate size, used for a gambling saloon, rented for \$40,000 per annum, and \$7,000 per month was paid by the government for a custom house. From 8 to 15 per cent, per month with real estate security was paid for money. People paid these enormous wages, rents, and interest, and still accumulated immense sums for themselves. Real estate rose enormously, and rapid fortunes were made by speculators in houses and lots. As a matter of course, among the emigrants to California were a large number of outlaws from all parts of the world, but mainly from Australia and the United States. In the earlier history of gold digging there were no efficient means for a proper administration of justice. Lynch law was resorted to in many parts of the country, and finally vigilance committees were established in the chief towns, by whom thieves and murderers were arrested, summarily tried, and if convicted, hung. In San Francisco, in 1851, crime in the forms of incendiarism, burglary, robbery, and murder, increased to such an alarming extent, that the public became impressed with the idea that the courts were the protection and refuge, instead of the terror of rogues, and a vigilance committee which had been previously formed took 2 men, McKenzie and Whittaker, from the city prison and hanged them in the street. For a time thereafter, crime appeared to be less rampant; but dreadful abuses prevailed in the city government, and finally, in 1856, Mr. King established the "Bulletin" newspaper, in which he criticized in severe terms the action of the city government, and commented particularly on the character of a man named Casey (who had served a term in the N. Y. state prison), a member of the board of supervisors, and whose influence over the political success of his party was potent. He was charged with selling nominations for a price, and with furnishing ballots and ballot-box stuffers to elect his nominees; and also with procuring the passage of fraudulent bills through the board of which he was a member. On May 14, Casey murdered Mr. King by shooting him in the street, and then gave himself into the hands of the authorities. The vigilance committee, which had never been disbanded, was now put into active operation. The city prison

was strongly guarded till the 16th, when a formidable force from the committee demanded Casey, who was surrendered by the sheriff and taken to the cells of the committee. Charles Cora, a gambler, who had shot Mr. Richardson, the U. S. marshal, was also taken from the prison, and after trial on the 22d, they were both hung in front of the committee's rooms, the people and press of California very generally sustaining the proceeding. The vigilance committee had its constitution and appointed an executive committee, to whose supervision the general management was intrusted, and which performed its functions with the utmost quietness and dignity. One of the provisions of the constitution was, that no person brought before the committee should be punished without a fair trial and conviction. The committee provided itself with arms and ammunition, drilled its forces, fortified its head-quarters, constructed cells for prisoners and apartments for its various necessities. It arrested and tried rogues and dangerous men, some of whom were hung, some transported, and others acquitted.—A notorious person, called Yankee Sullivan, committed suicide while the committee were deliberating on his case. On June 2, a writ of *habeas corpus* was issued by Justice Terry, of the supreme court, for the rescue of Mulligan, a prisoner in the hands of the committee. No attention was paid to the writ, and on the following day Gov. Johnson proclaimed San Francisco in a state of insurrection, ordered out the militia of the city, and commanded the vigilance committee to disband and disperse. Very few of those opposed to the proceedings of the committee responded to the call, and practically the power of the state was, for the time, in the hands of the committee. The governor called on Gen. Wool for U. S. troops without success, and also on the president of the United States. In the mean time the committee continued their labors, banishing prisoners to the Atlantic states, to Australia, and the Pacific islands. On June 21, they captured a quantity of state arms in transit from Benicia to San Francisco, and intended for the use of the governor's militia. A force from the committee was sent to arrest a Mr. Maloney. He was found in company with Judge Terry, who opposed the arrest, and in so doing dangerously stabbed Mr. Hopkins, one of the committee's police. The judge was subsequently arrested by the committee and held a prisoner till the recovery of Mr. Hopkins, when he was released or tried and acquitted. A few weeks later the committee surrendered its power, having, during its extraordinary administration of public affairs, tried and disposed of some 20 cases brought before them; 4 of their prisoners were executed, 1 committed suicide while his case was under deliberation, and most of the others were banished from the state. The proceedings of the committee were attended with heavy expense, which was borne by voluntary contributions. The ensuing election resulted

in the choice of city and county officers favorable to the committee, and the city has been comparatively quiet and orderly ever since. A number of suits for damages have been commenced against members of the committee by certain parties who had been expelled.—The elastic energy and unconquerable enterprise of the people of California have been strikingly illustrated in the rise, progress, repeated destruction, and rapid resuscitation of her principal towns. In the earlier history of the gold fever, when the principal mercantile operations of California were conducted in canvas tents or rudely constructed wooden buildings, the chief towns were frequently destroyed by fire or flood, or both. Ere a month had passed after one of these destructive visitations, other buildings would take the places of those destroyed, and apparently all traces of the fire would be lost in the bustle and business activity of the town. San Francisco, the metropolis of California, has been six times nearly destroyed by fire. Sacramento, and other large towns, have also suffered in the same way. The total loss by fire in San Francisco alone has been estimated at \$20,000,000, yet the growth of that town is without a parallel on this continent.

CALIFORNIA, GULF OF (Sp., *Mar Bermejo*, or the Red sea), a gulf of the Pacific, which separates the peninsula of California from the Mexican states of Sonora and Chihuahua. It is about 700 miles in length, and from 40 to 100 in breadth. Its coast is indented with many small bays, and numerous islands stud its surface. The rivers Colorado and Gila discharge their waters into its upper extremity, and the villages of Loreto, La Paz, and Guaymas are situated on its shores. This gulf has been celebrated for its pearl fishery.

CALIFORNIA, LOWER, or OLD (Sp., *Baja*, or *Vieja California*), a department and peninsula of the Mexican republic, situated on the W. coast of North America, and having Upper or New California N., Sonora and the gulf of California E., and the Pacific ocean S. and W. It is about 750 miles in length, and from 30 to 150 miles in breadth. This region is of volcanic origin, and is traversed throughout by the Sierra Nevada range of mountains, which attains in some places to an elevation of nearly 5,000 feet above the level of the sea. These mountains are in general barren and desolate near their summits; but at their base, caucuses of extraordinary size are to be met with, and such of the valleys as have a sufficiency of water are of exuberant fertility. The climate is variable. The summer temperature on the coast of the Pacific ranges from 58° to 71°. The sky is remarkable for its transparency and deep azure color, save at sunset, when it is often variegated by the most beautiful shades of violet, purple, and green. In winter there is heavy rain and terrific tornadoes of wind, which sweep the soil from every exposed position into the sea, and force the cul-

tivator to seek a new locality. The principal vegetable productions of Lower California are maize, wheat, beans, peas, manioc, grapes, oranges, lemons, citrons, prunes, dates, plantains, and pineapples. The chief animals are wild sheep, goats, horses, horned cattle, mules, and pigs. The adjoining seas are stored with an abundance of excellent fish. There is a pearl fishery in the S. part of the gulf of California, which in 1851 employed 15 boats and produced pearls which were worth \$85,000. It is said that valuable gold mines abound in this peninsula. The chief towns are La Paz, the capital, and Loreto. Pop. in 1850, 12,000. Lower California was discovered by Fortunato Zimenes, in 1584. In 1688 the Jesuits formed establishments here, and instructed the natives in agriculture and the arts of civilization; but in 1767 they were expelled, and the destinies of California committed to the guardianship of the Dominican monks of the city of Mexico, who were very far from following in the footsteps of their predecessors.

CALIGNY, JEAN ANTÉNOIR HUE DE, a French engineer, member of a French family which has produced a great number of able engineers, born in 1657, died in 1781. He was present at the sieges of Valenciennes, Fribourg, Courtrai, Furnes, Dixmude, and eventually became director of the fortifications of Burgundy, where he superintended the construction of the canal of that name. During the bombardment of Calais by the English, he decided the issue of the battle by the 2 forts, Fort Rouge and Fort Vert, successively thrown up in such a manner as to arrest the progress of the hostile army. Again in 1706, after the battle of Ramillies, he frustrated the plans of Marlborough, by causing the two banks of the canals of Leffinghes and of Bruges to be inundated, although his own estates were the first to suffer from this inundation. He also constructed the great dam on the Aar, at Gravelines, and 8 forts with bastions at Furnes.

CALIGULA, CAIUS CÆSAR AUGUSTUS GERMANICUS, son of Germanicus and Agrippina, born in camp, it is supposed in Germany, A. D. 12, murdered in Rome, Jan. 24, 41. His nickname of Caligula, the use of which, in his latter years, he held a serious offence, came from the military boot or brogue, *caliga*, worn by the common legionary soldiers, which he was made to wear in his early childhood, for the purpose of conciliating the good will of the men, which, in fact, he retained to the last. After the murder of his father, by Piso and Plancina, and the exile and voluntary death of his mother, in the isle of Pandataria, he was brought up by his great-grandmother, Livia Augusta, until her death; when he was taken to the house of his grandmother, Antonia. Having escaped the fate of his mother and brothers, he ingratiated himself with Tiberius, who promoted him to offices of honor, and held out to him hopes of the succession. It was one of the earliest pleasures

of Caligula to be present at executions, and he became in his youth an amateur in the inspection of human agonies, as in his maturer years he was a curious and ingenious inventor of new torments. The death of Tiberius, A. D. 37, which was caused or accelerated by Caligula, brought him into power. By his testament, Tiberius had associated with Caius, in the empire Tiberius Gemellus, the son of the elder Drusus, his own son by Agrippina Vipsania, who had been poisoned by Sejanus; but on the pretext of his youth, Caligula procured that he should be set aside by the senate, although in every other respect he affected a profound respect for the will of the late emperor, even to the allowing the wretches who were lying under sentence of death in the dungeons, and who now expected the act of grace usual at a new accession, to be strangled. But for a time, the world had a moment in which to breathe freely. A foreign writer, not a native or inhabitant of Rome, has left a singular record of this brief epoch, so strangely contrasted with those which preceded and followed it. "The Greeks," he writes, "had no quarrels with barbarians, nor the soldiers with the citizens. Men could not sufficiently admire the incredible felicity of this young prince. He had immense riches; great forces, both by land and sea; prodigious revenues, coming in to him from all quarters of the world. The limits of his empire were no less than the Rhine and the Euphrates, beyond which there existed only savage populations, the Scythians, the Parthians, the Germans. Thus, from the rising of the sun to his setting, over the continent and in the isles, even beyond the sea, there was no sentiment but joy. Italy, Rome, Europe, Asia, held constant holiday. For under no other emperor had men tasted such repose, had they been permitted so tranquil an enjoyment of their own property. In all towns were to be seen altars, victims, sacrifices, men clad in white and crowned with flowers, games, concerts, festivals, dances, horse-races, revelry of all kinds. Rich and poor, noble and plebeian, debtor and creditor, master and slave, all partook of one common happiness, as if it had been a saturnalia." For 7 months this state of things continued, when, in consequence of debaucheries and excesses, the prince fell ill, and was like to die; and the Roman world, ignorant into what hands it would fall next, gave itself up to despair. All men put on mourning; they sat up all night long, and beset the palace gates for tidings. Men vowed their lives to redeem that of Caligula. There is much cause to believe that from this time forth he became, if he had not been one before, a madman. From his infancy he had been subject to epilepsy. Morally and physically, his nature was without balance or regulation; at one time undergoing the most extraordinary fatigues, at another scarcely able to support himself; confessing, at moments, that he was conscious of the germs of incipient madness, and considering

the propriety of secluding himself and taking hellebore. He scarcely slept 8 hours out of the 24; and, even during these, his slumbers were disturbed by frightful dreams and apparitions. He often passed whole nights in pacing up and down the vast porticos of his palace, waiting the approach of day, and invoking it with passionate apostrophes; in all things, he was different, and differently organized, from other men. Immediately on his recovery, he threw off all restraint. We find him committing incest with his 8 sisters, Julia, Agrippina, and Drusilla; disgracing, impoverishing, banishing the 2 former, on her death deifying the latter, and then chuckling within himself in idiotic delight at the idea that he had got all his flatterers into a deadly dilemma; since they were equally guilty of impiety and worthy of death if they should mourn for Drusilla the woman, when Drusilla is a goddess, or rejoice at the deification of Drusilla, when Drusilla the woman is dead. We find him putting to death, in torture, the adulterers, who had vowed their own lives for the restoration of his life, in order to teach them to keep their word with the gods. We find him, economically, giving the old gladiators to the beasts of the circus, for the twofold reason that meat is dear, and that supporting old gladiators is a needless expense to the state. We find him delighted at being able to convict the consuls of treason, in either case, whether they should or should not celebrate the victory of Actium; since, on his mother's side, he is of the family of Augustus, the victor; on his grandmother's, of that of the vanquished Antony. We find him building bridges from Baiæ to Puteoli, more than a league in length, the pontoons of which are all the corn fleet which supplied Rome with food, so that the city is furnished during the continuance of the fabric, the superstructure of which is a second Appian way, with taverns and wine shops on the wayside, and groves of timber trees to shade the passengers, and rivulets of fresh water, running far out to sea, to water the horses, and then, to crown the celebration, ordering the crowds who came to gaze upon the wonder to be thrown into the Mediterranean, and bewailing his bad luck because it is fine weather with a calm sea, so that most of these victims of his merry mood make their escape by swimming. Even in his more harmless pleasures, we find the same cynical and insane humor: removing the *velaria* from the amphitheatres, for the pleasure of seeing the whole people in an agony of heat and suffocation, under the fierce blaze of an Italian noontide; invading Germany, invading Britain, with innumerable armies and great fleets, in order to make the legionaries collect sea shells in their helmets, the spoils of the conquered ocean; and for want of German captives to exhibit at his triumph, having some unhappy Gauls, who were as much civilized men and citizens as himself, taught to speak German, and led through the streets with their hair, which had been let to grow long, dyed red, in

order to simulate prisoners of war, but not to simulate their fate, since that was real, for they were all scourged and beheaded, as if they had been genuine Germans. Lastly, we find him not only wishing that all the Roman people had but a single neck, that he might finish them all at one blow, but actually preparing to destroy half the senate, and more than half the equestrian order, when he was himself anticipated by the daggers of Cassius Chærea and his fellow-conspirators, who brought relief to Rome by murdering him 4 months after his return to the eternal city. Yet there were those who sincerely mourned him, and honored his remains. The prætorians regretted him, for he gave them gold and license and blood. The frivolous women and the dissipated young men of Rome regretted him, for he encouraged their debaucheries, gave them pageantries, games, shows of gladiators—in a word, something to do. What is strange is this, that the Jew Agrippa came at dead of night, to carry off the mortal relics of his master, at the risk of his own life, and give to them the rites of sepulture; that his sisters, Julia and Agrippina, whom he had outraged, compelled to infamy, and then disgraced for the infamy to which he had compelled them, immediately on their return from banishment, removed his remains to a more honorable sepulchre; that Milonia Cassonia, his wife, who, neither young nor beautiful, exercised so strange a fascination over him, that he had threatened to put her to the rack in order to make her explain how she made him love her, remained in attendance on his corpse, covered with his blood, until the murderers returned, when she opened her bosom to their swords, bidding them to haste, in order that she might die with her husband. Cassonia's request was granted, and she as well as the daughter she had borne to Caligula was put to death.

CALIPH (Arab. *Khalifa*), the title of the successors of Mohammed. There were 3 caliphates: 1st, the Oriental, first established at Mecca in 632, afterward at Damascus under the Ommyiades, and finally, till 1258, under the Abbassides at Bagdad; 2d, that of Cordova, founded in 756 by Abderrahman, a member of the family of the Ommyiades, which lasted until 1081; 3d, that of Egypt, or of the Fatimites, founded in 909 by Obaidallah, who pretended to be descended from the prophet's daughter, Fatima; it lasted until 1171, when it was overthrown by Saladin. The power of the caliphs of Bagdad was shaken in 934, when Rhadi assumed the office of *Emir al omra* (captain of the captains), with which the exercise of the absolute power, in the name of the caliph, was united. In Egypt, however, the caliphs maintained their spiritual authority until the conquest of that country by the Turks in the beginning of the 16th century. The Turkish sultans now assumed the dignity of caliph, and the grand seignior at Constantinople retains it to the present day, though his claim to spiritual authority is not

much regarded outside of Turkey. A new work on the caliphs, by Dr. Weil, is going through the press of Perthes in Gotha, and announced to be published in the course of 1858. The following table presents a chronological list of the successive caliphs, and of the close of their reigns:

1st. ORIENTAL CALIPH.		Moktadi.....	1094

CALIPPUS, a Greek astronomer, born at Cyzicus, in the 4th century B. C. He went to Athens, and became associated with Aristotle, whom he assisted in rectifying and completing the discoveries of Eudoxus. Already several attempts had been made to express in entire numbers the 8 great natural unities of time, the solar year, the lunar month, and the solar day. A century before, Meton had discovered that 19 years corresponded to 235 months, or 6,940 days. Calippus observed that by this calculation there was an error of about $\frac{1}{4}$ of a day each 19 years, which he proposed to avoid by quadrupling the cycle and reckoning it at 76 years, and omitting one entire day in each cycle. This period of 76 years was called the Calippic cycle, and was adopted by astronomers after the year 380 B. C.

CALIXTINES (from the Latin *calix*, chalice). There are 2 sects in ecclesiastical history known by this name. I. Those who demanded the communion in both kinds for laymen.

These Calixtines were a branch of the Hussites, and are also called Utraquists. They were the more moderate of the 2 branches of the followers of that reformer, and were willing to compromise the remaining 3 of the 4 points which the Bohemian heretics had submitted, as the terms of reconciliation, at a council of Basel (Feb. 16, 1433). The 4 points were, 1, the use of the cup; 2, the free preaching of the word of God; 3, the abolition of clerical endowments; 4, the punishment by the civil magistrate of heinous transgressions and mortal sins. At an embassy held at Prague some time after, the Catholics introduced these 4 articles, so amended as that they could support them; but now the Bohemian reformers refused to accept them as amended. The Calixtines, however, attaching so much importance to the 1st of the 4 articles, consented to waive the other 3, in consideration of securing this. They were opposed by the Taborites or Orphans, who contended for all the 4. The event proved in favor of the Calixtines, for in the following year a decisive battle crushed the hopes of the Taborites, and thereafter the only distinction from the Catholic communion which the Hussite party enjoyed, was that for which the Calixtines contended. II. The other body known as Calixtines were the followers of George Calixtus, one of the reformers in the 16th century, the founder of the party called Syncretists. See CALIXTUS, GEORGE.

CALIXTUS, the name of 3 popes. The first, born in slavery, was bishop of Rome from 217 to 222, when he is said by some to have suffered martyrdom. II. Born near Besançon, died in Rome, March 18, 1124. His family name was Guido of Burgundy, and he was the 5th son of William, count of Burgundy, and related to the queen of France, the emperor of Germany, and the king of England. In 1096 he was already archbishop of Vienne, and he soon after went to France and England in the quality of papal legate, principally in order to settle the vexed question of lay investiture. In 1119, Gelasius II. died at the abbey of Cluny, and Calixtus was appointed to succeed him. He held councils at Toulouse and at Rheims, at the latter of which 427 bishops and abbots were present, while the emperor Henry V. was encamped in the vicinity, with 80,000 men. Nevertheless he was solemnly excommunicated by Calixtus, in presence of the council. Among other decrees of this council was one declaring the archbishop of York independent of the archbishop of Canterbury. After closing the council Calixtus went to Rome in 1120, where an anti-pope, named Gregory VIII., had established himself under the protection of the emperor; but Calixtus expelled him, and with the aid of the neighboring princes stormed the castle of Sutri, whither he had fled, and made him prisoner. He next attacked the Frangipani, and Cenci, broke their power, and threw down their castles. In 1121 and 1122 he sent

legates to Germany, a diet was held at Würzburg, and finally the *pactum Calixtinum*, or concordat of Worms, was concluded. Henry sent ambassadors to the pope, and in 1123 the first Lateran council was held, at which 300 bishops were present, and in this council Henry was absolved, and the question of investiture finally settled. The remainder of his life was spent by Calixtus in active labor for the good of the church and of his states; and he paid particular attention to the decoration of St. Peter's church, and repairing the aqueducts of Rome. III. (ALFONSO BORGIA), a member of the Spanish branch of the Borgia family, born at Valencia, was pope from 1455 until Aug. 6, 1458, when he died. After having received an excellent education, he was promoted to a canonry by the anti-pope Benedict XIII. (Peter de Luna), whose party was embraced by Alfonso V., king of Aragon. Having soon after been called to the royal council by the above-mentioned prince, he was sent by him to Benedict's successor, in order to induce him to abandon his pretensions; and having succeeded in this mission, he negotiated the reconciliation of his sovereign with Pope Martin V., and was rewarded by that pontiff with the archbishopric of Valencia. About 15 years afterward (1444), he was made cardinal by Eugenius IV., as a reward for essential services in negotiating a reconciliation between himself and Alfonso V. On April 8, 1455, he succeeded Nicholas V. on the papal throne. The ruling idea of his pontificate was the revival of the crusades against the Turks. He made the most energetic and persevering efforts to unite all the powers of Christendom in this undertaking, but without much success. This pope is said to have administered the government of the church with zeal and ability. The greatest fault which he committed was the elevation of his 2 unworthy nephews, Rodrigo Lenzuolo and Milo, to the dignity of cardinal, the former of whom became afterward pope under the name of Alexander VI.

CALIXTUS, GEORGE, properly CALLISEN, a Lutheran divine, born at Meclby in Holstein, Dec. 14, 1586, died at Helmstadt, March 19, 1656. He studied successively at Helmstadt, Jena, Giessen, Tübingen, and Heidelberg. With a son of an opulent Dutch gentleman named Overbeck he made the tour of England and Germany, and by this means became acquainted with many of the leading reformers of those countries. The duke of Brunswick had, before his departure from the continent, been interested in the talents of Calixtus, by a discussion in which he had heard him engaged with a Jesuit. On his return the duke appointed him to a professorship in Helmstadt. Helmstadt was one of the original protesters against the "Form of Concord," that famous instrument drawn up in 1577, and always regarded as the Magna Charta of Lutheranism. Every thing in Helmstadt then readily fell under the suspicion of Calvinistic tendencies. Consequently, when Calixtus,

at the conference of Thorn (1645), showed himself so moderate in his Lutheran opinions as to favor and attempt the reconciliation of the Protestants and the Reformed church, he fell under the hatred of Calovius and his adherents, who insisted on his excommunication from the Lutheran church as suspected of Calvinism. Meanwhile, another party had just accused him of Catholicism, on account of one of his works, the "Epitome of Moral Theology." On the other hand, the Catholics regarded him as their most sagacious and insidious enemy. To sustain himself under this triple fire was no small task. He considered a union of the sundered body of Christ feasible, if the conflicting parties could be induced to return to the oecumenical councils and laws of the first 5 centuries. This plan gave rise to what is known in ecclesiastical history as Syncretism, though the followers of Calixtus are sometimes called Calixtines. These Calixtines, however, must not be confounded with the Hussite sect of the same name. He had embraced the Aristotelian philosophy, and that modified his treatment of the ethical system of Christianity. He was the first writer who attempted a truly scientific and philosophic symbol of Christianity. The Calixtine controversy continued long after his death, so that his influence on the theology of the succeeding age was greater than on that of his own.

CALKING, the process of driving tarred oakum into the seams between the planks of ships, in order to render the joints water-tight. A wisp of the oakum is drawn out and rolled together between the hands, and being laid over the seam, is driven by a wedge-shaped instrument, called the calking iron. The work is afterward gone over with a more powerful instrument of the same kind, which is held by one man and struck with a beetle held by another. When all the oakum is forced in that is practicable, the seams are payed over with melted pitch, and where they are to be covered with copper, a thread of spun yarn is laid in to make them flush with the planks.

CALL OF BIRDS. The call of the feathered races must not be confounded with their song, from which it is entirely and in all senses distinct. The former is their language, at all times, in all seasons, and is expressive, in so far as they can express them, of all their wants, passions, and desires, one alone excepted; the latter is occasional, limited to a single season of the year, when the bird is in a state of nature, limited to a single sex, the male, and expressive but of a single feeling, that of amorous desire. Many birds have no power of song; none, so far as it is yet ascertained, are without a call. Some, so far as it has been shown, have but a single call to express all their inclinations—although it may be doubted whether a more extended acquaintance with many of the wild tribes, whose distant haunts and secluded habits prevent the great enemy, man, from becoming familiar with their domestic and familiar ways, would not prove that the vocal qualities of all birds are

more extended in compass and more diversified than we are at first disposed to believe. Of many species of birds, the wild aquatic and semi-aquatic legions of the duck, goose, crane, plover, and sandpiper families, we know little in relation to their call beyond their passing cries, used as rallying notes or signals when on their voyages, or as alarm calls when startled by the approach of their enemies. A closer intimacy would, probably, teach us that even the most silent, in an ordinary sense, of the feathered races, have their sounds expressive of tenderness to their mates, of affection to their young, of alarm when the enemy is at hand, of gratulation on reassembling after absence, of invitation to partake in the food which is opportunely found, or of recall at the hour of roosting. Many birds, which are mute in the countries to which they migrate in the winter months, and have the reputation of being entirely voiceless, are clamorous when they breed, as is the case with the European woodcock (*scolopax rusticola*), and the jacksnipe, or judcock (*scolopax gallinula*), both of which are reputed dumb in the countries where they are shot, while in those where they breed they are known to have at least one note, and probably have many others, which are either never heard, never distinguished, or, if both, are assigned to others than those to which they belong, being uttered only in the seclusion of remote and solitary places, and addressed only to their young when in privacy, or to their mates when in the hour of courtship, or when sitting on their eggs, or caring for their tender broods. Some birds are known by their clang of tongues, as they sweep through the heavens in their migrations, clamoring in order to regulate their squadrons in the starless night, as wild geese, cranes, and many of the waders, which, when they are alarmed by the sportsman, rise voiceless and unheard, and feed in the daytime silent in the woods and wastes which they inhabit. Others fly silent, feed silent, and are, so far as we know, silent at all times, except when they spring upon the wing in any sudden alarm. Some again, as the passenger pigeons, make their migrations in silence, take wing in silence when alarmed, yet when alone in the woods, undisturbed and fearless, make the green solitudes sonorous with their conversations; others, like rooks, are at all times, especially in the breeding season, habitually noisy, yet rise in flocks without sound or signal. The song of all birds in a wild state is limited to the season of pairing, when the female, like the girl described by Moore in one of his poems, invariably "gives to song what gold could never buy," or while she is brooding hopefully on her eggs cheered by the love notes of the faithful lover, who recreates her patient labors with his voice, but ceases to sing when he, also, has cares paternal to fulfill. In some species which do not sing, there is an amatory call which answers the purpose of song, peculiar to the male bird during the season of the female's incubation, as the clear

scible whistle of the American quail, the cry of the cuckoo, the rousing of the dove, the harsh creak of the landrail, and the *beb-beb-beb* of the male of the English snipe, as it is falsely called in the United States (*scelopos Wilsonii*), which is either wholly discontinued, or is changed into something wholly different, when the season and the desire for reproducing their species have passed away. As a general rule, aquatic fowl are more noisy than land birds, sea fowl than fresh-water birds, nocturnal than diurnal birds, domesticated fowls than those in a state of nature, birds which congregate than those of solitary habits, and, with the exception of common poultry, migratory birds, which pass much of their time on the wing, than those which dwell on the ground. No one of these rules, however, is liable to numerous exceptions; for, while some sea birds, which congregate, are deafening in their clamor, they fly totally independent one of the other, not regulating their movements by signals of any kind; others, as many varieties of the *fringa* and *sceloposidae*, and *charadriidae* likewise, while they utter no sounds, yet wheel as regularly and orderly, in obedience to some concerted signal, as a well-disciplined regiment of horse. And, again, while some migratory birds are vociferous in the extreme, others are totally silent, and some non-migratory species, such as jacksnaws and rooks, exceed all others in the propensity they exhibit for hearing their own unswerving voices. None, since the days of Cæsar—the owner of the virtuous ring, whose properties, as described by Chaucer,

Werd thow that if she list to see to wene
Upon her thowch, or in her pouch to beere,
Ther is no fowle that heeth under lewren
That she so welle understood the cryen,
And knew his meaning openly and plain,
And answerde him to his langage again—

less pretended to possess the faculties of that gifted lady to their full extent; although the barman and fowlers of the Long Island shores and Atlantic beaches have, at least, so far advanced in the path of her mysterious lore, that, whether or not they can understand the stave, or sound (for such being interpreted does that hard word signify) of every fowl that heeth under heaven, and know his meaning openly and plain, they can in so far imitate their calls and hold converse with them, as they come and go, that the birds will turn on the wing to hear, "and answer them in their language again," and come down from the safe altitudes of cloud, or clear, to visit their treacherous decoys, and leave their plump pinions mowed down by their cruel volleys, to welter on the barren wye.—That sensible and delightful naturalist and writer, Gilbert White, of Selborne, Man whom no one has done more, if any one so much, to divert the pursuit of the knowledge of nature of tedious and tiresome technicalities, to bring ætology within the range of the general reader and observer, and to render science agreeable, popular, and interesting to all classes of intellect, without ex-

cluding it inexact, slipshod, or vulgar, discourses charmingly on the call of many birds, which are familiar to all persons, how little given over to ornithological or scientific pursuits. "From the notion of birds," he says, in one of his letters to the Hon. Daines Barrington, bearing date, Selborne, Sept. 9, 1778, "the transition is natural enough to their notes and language, of which I shall say something. Not that I would pretend to understand their language, like the visier who, by the recital of a conversation which passed between 2 owls, reclaimed a sultan before deluging in congress and devastation; but I would be thought only to mean that many of the winged tribes have various sounds and voices, adapted to express their various passions, wants, and feelings, such as anger, fear, love, hatred, hunger, and the like. All species are not equally eloquent; some are copious and fluent, as it were, in their utterance, while others are confined to a few important sounds; no bird, like the fish kind, is quite mute, though some see rather dumb. The language of birds is very ancient, and like other ancient modes of speech, very elliptical; little is said, but much is meant and understood. The notes of the eagle kind are shrill and piercing, and, about the time of nidification, much diversified, as I have been assured by a curious observer of nature, who long resided at Gibraltar, where eagles abound. The notes of our hawks much resemble those of the King of birds. Owls have very expressive notes; they hoot in a fine vocal sound, much resembling the *ser-à-ser-à*, and reducible by a pitch-pipe to a musical key." Elsewhere he says: "A neighbor of mine, who is said to have a nice ear, remarks that the owls about this village hoot in 3 different keys, in G flat or F sharp, in B flat and A flat. He heard 2 individuals hooting to each other, the one in A flat, and the other in B flat. Query: do these different notes proceed from different species, or only from various individuals?" "This note," he continues, in the letter first quoted, "seems to express rivalry and complacency among the males; they use also a quick call and a horrible scream, and can snore and hiss when they mean to menace. Ravens, beside their loud croak, can exert a deep and solemn note that makes the woods echo; the amorous sound of a crow is strange and ridiculous; rooks, in the breeding season, attempt sometimes in the gayety of their hearts to sing, but with no great success. The parrot kind have many modulations of voice, as appears by their aptitude to learn human sounds. Doves coo in an amorous and mournful manner, and are emblems of despairing lovers; the woodpecker sets up a sort of loud and hoarse laugh; the fern owl, or goat-rucker, from the dusk to daylight screams his mate with the chattering of castanets. All the useful passers express their complacency by sweet modulations and a variety of melody. The swallow, as has been observed in a former letter, by a shrill alarm bespeaks the at-

tention of the other *hirundines*, and bids them beware that the hawk is at hand. Aquatic and gregarious birds, especially the nocturnal, that shift their quarters in the dark, are very noisy and loquacious, as cranes, wild geese, wild ducks, and the like; their perpetual clamor preventing them from dispersing and losing their companions. In so extensive a subject, sketches and outlines are as much as can be expected; for it would be endless to instance in all the infinite variety of the feathered nation. We shall, therefore, confine the remainder of this letter to the few domestic fowls of our yards, which are most known, and therefore best understood. And first, the peacock with his gorgeous train demands our attention; but like most gaudy birds, his notes are grating and shocking to the ear; the yelling of cats, the braying of an ass, are not more disgusting. The voice of the goose is trumpet-like and clanking, and one saved the capitol of Rome, as grave historians assert. The hiss also of the gander is formidable and full of menace, and 'protective of his young.' Among ducks, the sexual distinction of voice is remarkable; for while the quack of the female is loud and sonorous, the voice of the drake is inward, and harsh and feeble, and scarce discernible. The cock turkey struts and gobbles to his mistress, in a most uncouth manner; he hath also a pert and petulant note when he attacks his adversary. When a hen turkey leads forth her young brood, she keeps a watchful eye, and, if a bird of prey appear, though ever so high in the air, the careful mother announces the enemy with a little inward moan, and watches him with a steady and attentive look; but, if he approach, her note becomes earnest and alarmed, and her outcries are redoubled. No inhabitants of a yard seem possessed of such a variety of expression and so copious a language as common poultry. Take a chicken of 4 or 5 days old, and hold it at a window where there are flies, and it will immediately seize its prey with little twitterings of complacency; but if you tender it a wasp or a bee, at once its note becomes harsh and expressive of disapprobation and a sense of danger. When a pullet is ready to lay, she intimates the event by a joyous and easy soft note. Of all the events of their life, that of laying seems to them the most important; for no sooner has a hen disburdened herself than she rushes forth with a sort of clamorous joy, which the cock and the rest of his mistresses immediately adopt. The tumult is not confined to the family concerned, but catches from yard to yard, and spreads to every homestead within hearing, till at last the whole village is in an uproar. As soon as a hen becomes a mother, her new relation demands a new language; she then runs clucking and screaming about, and seems agitated, as if possessed. The father of the family has also a considerable vocabulary; if he finds food, he calls a favorite to share it; and if a bird of prey pass over, with a warning voice he

bids his family beware. The gallant chattering has at command his amorous phrases, and his tones of defiance. But the sound by which he is best known is his crowing; by this he has been distinguished in all ages as the countryman's clock or 'larum—as the watchman that proclaims the divisions of the night. Thus the poet elegantly styles him 'the crested clock, whose clarion sounds the silent hours.' A neighboring gentleman, one summer, had lost most of his chickens by a sparrow-hawk, that came gliding down between a fagot pile and the end of the house, to the place where his coops stood. The owner, inwardly vexed to see his flock thus diminishing, adroitly hung a setting net between the pile and the house, into which the catiff dashed and was entangled. Resentment suggested the law of retaliation; he therefore clipped the hawk's wings, cut off his talons, and fixing a cork on his bill, threw him down among the brood hens. Imagination cannot paint the scene that ensued; the expressions that fear, rage, and revenge inspired, were new, or at least, such as had been unnoticed before. The exasperated matrons upbraided, they execrated, they insulted, they triumphed. In a word, they never desisted from buffeting their adversary till they had torn him in a hundred pieces."

CALLA, a genus of plants, belonging to the *arum* family, marked by an open and spreading spathe, with a white upper surface, an oblong spadix entirely covered with flowers, heart-shaped leaves, red berries, and thick creeping root-stocks. The *C. palustris* is a native of marshy places in the north of Europe, and is common in cold bogs in the northern United States. Its seeds are surrounded with jelly. In Sweden its root is dried, and furnishes a kind of meal from which bread is made. The *C. Ethiopica* was introduced into England from the Cape of Good Hope, in 1731. It is also found wild in St. Helena. Its large spathe is pure white, surrounding a spadix which is colored deeply yellow by its antheriferous flowers. It is often cultivated, and is one of the most beautiful of arceidaceous plants. Being hardy, it will live in temperate regions, growing in great vigor in the ordinary apartments of a house, and may be made to blossom all the year round.

CALLAN, a municipal borough, market town, and parish, on King's river, co. of Kilkenny, Ireland. One-third of the inhabitants of the town are said to be without regular employment. It has been the scene of many battles, and in 1650 was taken by Cromwell. It gives the title of viscount to the Fielding family. Pop. 3,100.

CALLANA, or CALANNA, a town and district of Soodan, N. W. Africa. It is situated among the mountains of the Bataka range, a system which branches from the mountains of Kong, and terminates in the Sahara.

CALLAO, or CALLAO DE LIMA, a town of Peru, 6 miles W. of Lima, of which it is the port; pop. 7,000. The original town was en-

they demolished and submerged by an earthquake in 1746, and at low tides its ruins are still visible in the bay. The existing town consists only of low houses, slightly built, plastered with mud, and with their windows in the roof. Its commerce is considerable; lines of steamers connect it with Chilli, Panama, &c.; the principal exports are bullion, cotton, soap, bark, and wool. Callao was the last stronghold of the Spaniards in South America.

CALLAWAY. I. A south-western county of Kentucky, on the west bank of the Tennessee river, here navigable by steamboats; area, 450 sq. m. Level and hilly grounds divide the surface almost equally. The soil, which possesses considerable fertility, produces tobacco, corn, and oats, and in 1850 yielded 405,765 bushels of Indian corn, 2,414 of wheat, 54,450 of oats, 957,361 lbs. of tobacco, and 18,637 of wool. There were 10 corn and flour mills, 6 saw mills, 3 tanneries, 24 churches, and 880 pupils attending public schools. Formed in 1821, and named in honor of Col. Richard Callaway, one of the early settlers of the state. Pop. in 1850, 8,096, of whom 992 were slaves. Capital, Murray. II. An eastern county of Missouri, bounded on the S. by the Missouri river, and having an area of 746 sq. m. The surface is moderately uneven, and about $\frac{1}{3}$ of it is occupied by prairie land. The soil is uniformly fertile, and the staples are wheat, corn, oats, tobacco, hemp, horses, cattle, and mules. The productions in 1850 were 511,895 bushels of Indian corn, 50,178 of wheat, 384,418 of oats, 866,800 lbs. of tobacco, and 177,369 of butter. There were 30 corn and flour mills, 6 saw mills, 6 wooden factories, 1 newspaper office, 81 churches, and 1,717 pupils attending public schools. Coal, iron, limestone, and potter's clay are found in various places, and in large quantities. Organized in 1820. Pop. in 1856, 15,906, of whom 4,627 were slaves. Capital, Fulton.

CALLCOTT, See AUGUSTUS WALL, an English landscape painter, born at Kensington in 1779, died there, Nov. 25, 1844. His principal productions are "Returning from Market," "Waiting for the Passage Boat," "The Ferry," &c. In his well-known picture, "Harvest in the Highlands," the figures were painted by Landseer. His "Raphael and the Fornarina" was circulated by the London art-union among its subscribers in 1843, in an engraving by L. Stocks.—**JOHN WALL,** an English musical composer, brother of the preceding, born at Kensington in 1766, died in May, 1831, assisted in 1787 in forming the glee club, and excelled particularly in that branch of national music. The degree of doctor of music was conferred on him in 1790. In 1806 he published his "Musical Grammar," and his choicest compositions were brought out in 1824, after his death.—**MARIA,** born 1763, died 1842, was a daughter of Capt. Dundas, married to Capt. Graham, after whose death she married Sir Augustus Callcott. She published an account of her

travels in India, "Three Months in the Environs of Rome," "Memoirs of Poesda," &c. Her 2d husband turning her attention to the fine arts, she published in 1826 "Essays toward the History of Painting."

CALLE, LA, a seaport of Algeria, pop. 300, in the province of Constantine. It is built on a peninsula in the Mediterranean, and is the principal seat of the French coral fishery.

CALLEJA, FRANCIS DE, conde de Calderon, a Spanish general, born in 1750, died about 1820, distinguished himself in Mexico by quelling the insurrection instigated in 1810 by Hidalgo, who was on the point of seizing the city of Mexico, when Calleja was charged by the viceroy Venegas to oppose his progress. After encounters, in which both parties strove to surpass each other in a display of cruelty and brutality, Calleja succeeded in defeating Hidalgo's army, and on Jan. 2, 1812, he took possession of the principal fortress Zitacuara, and massacred the inhabitants. Hidalgo, who fell near Guadalupe, was succeeded by the priest Morelos, who defended Cuautla Amilpas against the attack of Calleja with great bravery until May 2, 1812, when famine forced him to surrender. Calleja again signalized his victory by acts of barbarism, and was rewarded for his zeal, March 4, 1813, by the appointment of viceroy, in which capacity he continued to abetate the feelings of the Mexicans by his relentless rigor. The priest Morelos fell into his hands and was shot, Dec. 22, 1815. Subsequently he promulgated an amnesty, but as he was unable to restore peace to the distracted country, he was recalled, Sept. 20, 1816. On his return to Spain he was created conde de Calderon, and in Jan. 1820, while preparing to sail from Cadix against the revolutionists of Paraguay, his troops having mutinied, he was captured and remained prisoner in the fortress of the Isla de Leon until the insurrection was quelled by Ferdinand VII., when he died, soon after having recovered his liberty.

CALLENDER, JAMES THOMSON, a political writer, born in Scotland, died at Richmond, Virginia, in July, 1803. For a long time he was editor of the "Richmond Recorder," and distinguished himself by his virulent attacks upon the administrations of Washington and Adams. He also published the "Prospect before us," "Political Progress of Britain," and "Sketches of American History." He was at one time a friend of Jefferson, but became his enemy and calumniator. He was drowned in the James river while bathing.

CALLICHRATIDAS, a Spartan, succeeded Lyander, B. C. 406, in the command of the Lacedæmonian fleet against the Athenians, by whom he was defeated off the Arginæuse; and, thrown overboard in the action, he was drowned. Calliocratidas was a Spartan to the core. When asked what sort of men the Ionians were, he replied, "Bad freemen, but excellent slaves."

CALLIERES, FRANÇOIS DE, a French diplomatist and author, born in Thoiry, in lower

Normandy, May 14, 1645, died in Paris, May 5, 1717. He was sent to Poland in 1672, for the purpose of advancing Longueville's claim to the Polish throne. He officiated as ambassador in Holland, and was present at the signing of the treaty of Ryswick, Sept. 20, 1697.

CALLIMACHUS. I. A Greek architect and statuary, supposed to have lived before 396 B. C., and said to have invented the Corinthian column. II. An Alexandrine grammarian and poet, born at Cyrene, in Africa, lived in the reigns of Ptolemy Philadelphus and Euergetes, and was chief librarian of the celebrated Alexandrian library, from 260 until 240 B. C., when he died. For some time he had kept a school at Alexandria, and numbered among his pupils Eratosthenes, Aristophanes of Byzantium, and Apollonius Rhodius. Only 6 hymns and 78 epigrams remain of his numerous writings.

CALLINGER, a strong British fortress in Bundelcund, Hindostan, built on the summit of a mountain 1,280 feet above the sea, is about 5 miles in circuit. After the British had taken possession of all the surrounding district, they were obliged to lay regular siege to this fortress, and took it with great difficulty and after many efforts, Feb. 28, 1812. In earlier times it had resisted sieges more than 10 years long.

CALLINUS, of Ephesus, the earliest Greek elegiac poet, lived about 700 B. C. One of his elegies consisting of 21 lines is extant, having been preserved by Stobæus.

CALLIOPE, in Greek mythology, the muse of epic poetry, named from the sweetness of her voice. She is represented in ancient art as bearing a tablet and stylus, waiting to record heroic deeds. She is particularly associated in the ancient statues with Homer.

CALLIOPE, a steam musical instrument, invented by Mr. Joshua C. Stoddard, of Worcester, Mass. Valve chambers are arranged along the top of a steam chest or cylinder, each one furnished with a double metallic valve, seated steam-tight without packing. A small stem passes from each of the valves through the chamber to the outside, by which the valve may by slight pressure be opened; the pressure taken off, it instantly closes. Over each valve is a steam whistle, each having its own tone. A cylinder with cogs, like that of a music box, is so placed as to lift the valves as it revolves, and thus produce tunes. By recent improvements the tunes may be played by striking keys similar to those of a piano.

CALLIPHON, a Greek Epicurean or rather eclectic philosopher, who taught that the highest good of man consists in a union of virtue and bodily pleasure.

CALLIRRHOE, a fountain near Athens, called also Enneacrunus, because its waters were distributed by 9 channels. It still bears its ancient name.

CALLISTEIA, festivals among the ancient Greeks at which the prize of beauty was adjudged to the fairest. One of these contests was held by the Lesbian women in the temple

of Juno on their island; another formed a part of the festival celebrated by the Parrhasians in Arcadia, in honor of Ceres Eleusinia; and a 3d occurred among the Eleans. In the last, however, only men contended; and the most beautiful man received a suit of armor which he dedicated to Minerva, and on his way to the temple was encompassed by his friends and adorned with ribbons and a myrtle wreath.

CALLISTHENES, of Olynthus, a pupil and relation of Aristotle, by whose recommendation he accompanied Alexander the Great to Asia. He often expressed disapprobation to Alexander, and at length, when the conqueror had adopted the pomp and the humiliating ceremonial of the Persian court, Callisthenes not only freely uttered his own indignation, but excited displeasure among the soldiers. He was put to death by command of Alexander. Of the several histories which he wrote, no one has come down to us; but one of the most popular of the mediæval romances, filled with traditions and fancies concerning the oriental life of Alexander, has been attributed to him.

CALLISTHENIOS (Gr. *καλλος*, beauty, *σθενος*, strength), a system of exercises which has for its object the development of physical grace and vigor. The callisthenic exercises, requiring less violence of muscular action than the ordinary gymnastics, are considered to be better adapted to the more delicate organization of females, and are generally confined in their application to that sex. Their purpose is to give equal development to all the voluntary muscles, and thus produce that harmony of action on which depends not only health, but regularity of proportion and grace of movement. Callisthenics may be practised mediately or immediately, with or without apparatus. All the apparatus required, when used, is a strong chair, a short roller fixed in sockets near the top of an open doorway, a light wooden staff, about 4½ feet in length and ½ an inch in diameter, a pair of light dumb bells, a hair mattress, a couple of square weights, and 2 parallel bars. The exercises with these are simple, and can be readily learned in a lesson or two from a teacher, or, in fact, from any of the numerous manuals published on the subject. They are difficult to describe, however, without the aid of diagrams. In the chair exercise, the pupil plants her feet at some distance, and then leans forward on tiptoe, and rests her hands upon the back of the chair. The exercise consists in moving the body slowly backward and forward between the two fixed points of the toes on the floor and the hands on the back of the chair. This simple manœuvre is admirably adapted for the expansion of the chest, and the development of all the muscles of the trunk of the body. In the roller exercise the pupil suspends herself by her hands a few inches above the floor, and swings in this position, or moves her grasp alternately from side to side. This, however, is an exercise which, however favorable to strength, will not be considered so con-

desire to beauty by those fair-dances who value the head of luxury, with its soft and lily-white texture, more than the hard palm of utility. A great number of graceful and strengthening movements may be made with the staff. One of the best is to hold it in both hands, and pass it successively over the head to the right and left, bringing it down each time below the middle of the person, in front or behind. The dumb bells, being grasped by the hands, are to be moved forward and backward horizontally from the chest, or with the arms below the legs, to be moved circularly about the body, until they meet before and behind. The exercise on the mattress consists merely in raising the person from a horizontal to a sitting posture, while the arms and legs are extended, and not used to aid in the movement. The square weights may be used in most cases like the dumb bells. They have, however, the peculiar advantage of a form which allows of their being placed upon the head. This is one of the best possible means of giving uprightiness to the figure, as in thus balancing a weight, the spine is necessarily brought by the muscles of the back into a straight position. The negro women of the South, who are in the habit of carrying heavy burdens on their head, are remarkable for stoutness of body. The parallel bars are 2 poles stretched at their ends to the floor and the ceiling, at a proper distance apart, and of a thickness to be readily grasped by the hands of the pupil, which being done, she moves the body backward and forward between them. Every necessary exercise, however, can be practised without the use of apparatus of any kind, and the system of callisthetics founded on this basis is probably best for general adoption, as less liable to abuse from the intemperate zeal of the pupil, and more calculated to preserve the *res vana*, the beautiful, which few women will be persuaded to exchange for any acquisition of *edness*, strength. When apparatus is used, the effort is more violent, and the muscles may become so prominently developed as to cause the absorption of the soft cellular tissue which cushions the human frame, and which, by its abundance in the female, gives that beautiful and distinctive roundness and fulness to her form. The constant handling of the hard material of the apparatus, also, is apt to produce not only a disproportionate enlargement of the hand, but so to coarsen its texture, that most of our fashionable ladies would consider health, bought at such a price, a dear purchase. The callisthetic exercises without apparatus consist in regular and systematic movements of the whole body. The head and the trunk are moved up and down, forward and backward, to the right and left; the arms and legs, and hands and feet, are also so exercised that every voluntary muscle is brought into action. The object being to give an equal muscular development to the whole frame, the exercises are so arranged that each part of the body has its share in turn. None of the movements are

complicated, and, in fact, are no more than those usual in the ordinary exercise of our limbs. Callisthetics, however, by reducing these to a system, insures an equal and regular action of the muscles, while the occupations or amusements of females are apt to effect the reverse, and thence cause both distortion and ill health. It is essential that all these exercises should be practised, if in-doors, in well-ventilated halls or apartments; for without pure air, great muscular activity is more conducive to disease than health.—The practical utility of all gymnastics is much interfered with by the early weariness of the pupil with the uniformity of the movements. Without the discipline of a teacher, it is difficult to secure a long persistence in the exercises. It is well, therefore, to vary them, or to associate with them as much as possible the idea of amusement. In fact, there is no better callisthetic apparatus than many of the ordinary playthings, such as the shuttlecock and shuttlecock, the cap and ball, and the "grooves." Horseback exercise, which is now confined to the opulent, ought, as it might economically, to be introduced into every school; and swimming, which is almost entirely neglected by the female sex—everywhere except in the Sandwich Islands, where it is now, however, fast disappearing before a civilization, barbarous at least in this respect—should be taught to every girl, and practised universally. Ling, the Swedish writer on gymnastics and callisthetics, has written enthusiastically upon the advantage of systematic muscular exercises in the cure of disease. Many of those ailments to which females are peculiarly liable are owing to the neglect of proper physical training, and may be cured, doubtless, by the proper application of callisthetics. Most of these female disorders may be justly attributed to the weakness of the abdominal muscles, and a proper strengthening of them by exercise would, no doubt, remove the cause.

CALLISTO, an Arcadian nymph, a companion of Diana in the chase, beloved by Jupiter, to whom she bore a son Arcas. To conceal the amour, Jupiter metamorphosed her into a she bear. Juno discovered the truth, and caused Diana to shoot the bear. Jupiter placed Callisto, under the name of Arctos, among the stars.

CALLISTRATUS, the Athenian orator by whose eloquence Demosthenes was so impressed that he abandoned the study of philosophy, and determined to devote himself to oratory. He was banished in the year 361 B. C., and upon his return to the city was put to death.

CALLON, one of the earliest Greek sculptors, a native of the island of Egina, lived about the year 516 B. C. His statues were wrought in marble, bronze, and wood.

CALLOT, Jacques, a French engraver, born in 1692 at Nancy, died there in 1765. His early passion for art was imposed by his father, who was the herald-at-arms of the duchy of Lorraine. Jacques made his escape to Florence, where he entered the studio of Renigio Cantu Gallina. He was, however, compelled to return

home, only to escape again. But again he was brought back to Nancy by his oldest brother, who lay in ambush for him at Turin. Finally, his father yielded to his desire; he resumed his studies in Italy, and eventually acquired great celebrity as an engraver. He executed over 1,500 plates, and made himself very popular by etchings which illustrated the life and manners of the people. He excelled also as a painter, but his universal reputation depends mainly on his engravings of the temptation of St. Anthony, his fairs of Nancy, his battles and sieges, his punishments, and a few others.

CALLUS, any preternatural hardness in the body, particularly of the skin, as on the hands or feet, from friction or pressure. The hardened edges of a wound or ulcer are also termed callus; but the most common application of the word is to the new growth of osseous matter around and between the extremities of fractured bones, serving to unite them. The mode of reparation is attended by the following changes: 1. Extravasation of blood where the bone is fractured. After this is absorbed, liquor sanguinis is effused, and assumes the position which the blood had occupied. 2. This consolidates, and the watery portion being absorbed, the rest becomes organized. 3. This period of plastic exudation lasts 8 or 10 days, and then becomes quasi-cartilaginous. 4. This mass contracts, increases in density, and gradually becomes what is commonly termed bone, but it is not true bone, though very hard and strong. 5. The ossification or solidification advances from the periphery, and the fractured extremities are now surrounded by a bony case termed the provisional callus. 6. After this is formed, continuity is truly restored by the formation of what is called definitive callus or true bone, which takes place between the fractured extremities. 7. Finally, the provisional callus is absorbed and disappears. It was formed merely to serve as a natural case or splint to maintain the broken extremities in their position, while the osseous reparation was proceeding to restore the natural unity and continuity of structure. The provisional callus is not true bone, but a hard substance resembling ivory or bony structure.

CALLY, PIERRE, a French theologian, born near Argentan, about the middle of the 17th century, died Dec. 31, 1709. He was the first person in France who accepted fully the philosophy of Descartes, for which he was exiled for 12 years to Moulins. He published several works upon philosophical and theological topics, and also edited the *De Philosophia Consolationes* of Boethius.

CALLMAR, or KALMAR, a seaport town of Sweden, pop. 5,346, on the strait separating the island of Oeland from the continent, 190 miles S. S. W. from Stockholm. Here, in 1397, was concluded the treaty known as the "Union of Callmar," which united the 8 kingdoms of Sweden, Denmark, and Norway under Margaret, daughter of Waldemar III. Here also, in 1520, Gustavus Vasa disembarked to put a final end to

the union. Louis XVIII., during his exile from France, resided at Callmar in 1804, and erected there a tablet in honor of Gustavus.

CALMET, AUGUSTIN, a French scholar and Benedictine of the congregation of St. Vannes, born Feb. 26, 1672, died in Paris, Oct. 20, 1757. He began to study theology in the priory of Breuil, but learned Hebrew under Faber, a Lutheran divine. In 1698 he was appointed to instruct the younger monks of Moyon-Moutier in theology; in 1704 he became director of the abbey of Munster, where he expounded the Scriptures; and he passed thence to the abbey of St. Léopold, near Nancy, in 1711, and to that of Sénones in Lorraine in 1728. He was actively engaged in his duties till his death, honored by all for his piety and simplicity, and held in regard even by Voltaire. He devoted himself laboriously to archaeological, historical, and theological studies, and left many learned works, among which is his celebrated "Dictionary of the Bible."

CALMUCKS, the most numerous and celebrated people of the Mongol race, inhabiting parts of Asia and eastern Europe, and belonging to the empires of China and Russia. They were formerly called the *Eleutes*; the Tartars call them *Khalimik*, or apostates; and they call themselves *Derben Eret*, or the 4 allies. They are divided into 4 principal hordes: the Khokhots, numbering 40,000 families, who inhabit eastern Thibet and the environs of Koko Nor, which they regard as their native seat; the Dzoungares, or Soongars, giving their name to the country Soongaria, having from 20,000 to 30,000 families, and formerly the richest and most powerful of the hordes; the Derbeta, or Tchoros, who migrated from Soongaria in 1631, established themselves on the upper Tobol, became vassals of Russia, and during the last century took possession of the steppe between the Don and the Volga, where they now form 15,000 families, and are associated with the Cossacks of the Don; and the Torgots, or primitive tribe of Soongaria, who migrated to the Volga to the number of 55,000 families in 1662, but in consequence of vexations received from Russian agents, returned in 1771 to the banks of the Emba. The Calmucks are described as one of the ugliest in appearance of all the tribes of men. They are small and thin, with brown complexion, round faces, piercing eyes set near together, thick lips, wide nostrils, projecting cheek bones, large and prominent ears, and black, thick, and bristling hair, which is shaved from the greater part of the head. Their ugliness is their title to purity of race. They are descendants of the Scythian barbarians of antiquity, and of the Huns who under Attila terrified the southern nations of Europe as much by their hideous aspect as by their ferocity. They are slothful, but intelligent, curious, violent, and deceitful, though hospitable. They have extraordinary delicacy of sense, especially of sight, and their memory is such that many of them know by heart the songs of their bards and long passages from their sacred books and

national epics. They are nomadic, dwelling in wooden tents, which they arrange in straight lines like the streets of a town. Their costume usually consists of small kid boots, short trousers, a jacket with narrow sleeves, and a large shawl. Their arms are the bow and arrow, the lance, and sometimes guns, scymitars, and pistols. They devote themselves to the chase and to fishing, and their principal riches consist in horses and sheep. They are almost always on horseback, and have bow-legs, with their feet turned toward each other. In war they make their expeditions by night, attack suddenly and massacre their enemies, and retreat with booty. Their ancient religion is Lamaism, though they have generally embraced Buddhism, and a few isolated branches of it have been converted to Christianity or Mohammedanism. Their priests, or *ghilongs*, exercise great influence among them, but their oppressions have been much diminished in the Russian possessions by several ukases of the czar. Russia founded, in 1829, a special school for the education of interpreters and functionaries among the Calmucks.

CALOMARDE, or **CALOMARDA**, FRANCISCO TARRIO, count of, a Spanish statesman, born in 1775 at Villal, in Aragon, died in Toulouse, France, in 1842. He was employed in the office of the minister of justice, and was made chief of this department during the time when the central junta, in order to escape from the sway of Napoleon, sat at Seville, and afterward at Cadix. In 1814, on the return of Ferdinand VII., Calomarde was made chief secretary of the department of Indian affairs. Here he was convicted of bribery, and banished to Toledo, and afterward to Pamplona. In 1823 he received the appointment of secretary to the regency, and subsequently an important office in the royal household, in addition to which he was appointed minister of justice. He organized the corps of royalist volunteers, who proved efficient auxiliaries to the crown, recalled the Jesuits, reopened the convents, and closed the universities. In 1832, when Ferdinand's death was supposed to have taken place, Calomarde was the first to bend his knee before Don Carlos. The king recovered from the illness which for a time had threatened his life, but lingered in a semi-idiotic condition: of this Calomarde took advantage, by extorting from him his signature to the act of Dec. 31, 1832, in which Ferdinand abdicated in favor of Don Carlos. When Ferdinand revealed this fraudulent proceeding, Calomarde was expelled from the capital, and banished to his seat in Aragon, and only escaped imprisonment, to which a short time afterward he was condemned, by escaping to France in disguise. Here he passed the rest of his days in obscurity.

CALOMEL. Mercury combines with chlorine in 2 proportions, forming the subchloride or calomel, and the protochloride or corrosive sublimate, the one consisting of 1 equivalent of chlorine and 2 of mercury, Hg₂Cl, and the

other of 1 equivalent of chlorine and 1 of mercury, HgCl. The name calomel is probably derived from the Greek words *kalos*, fair, and *melas*, black; a black mixture being produced in the process of preparing it by rubbing mercury with corrosive sublimate, and this, when subjected to heat, yielding the white sublimate calomel. It occurs as an ore of mercury, which is called horn-quick-silver, found in the quick-silver mines of Adria in Carniola, Almaden in Spain, and other localities. It is in the form of a crystalline sublimation, coating other substances, and of granular structure. It is also crystallized in quadrangular prisms, of yellowish gray and ash-gray colors. Its hardness is 1-2, and specific gravity 5.452.—As prepared for medicinal purposes, calomel is either obtained as a powder by precipitation, or is reduced to a powdered state from the crystalline cake obtained by sublimation. It is a substance without taste or smell, insoluble in water, ether, and alcohol, and becomes black by exposure, without undergoing chemical change. For this reason it is necessary to keep it protected from the light. It requires a higher temperature than corrosive sublimate to volatilize it, and in the sublimation a portion is converted into mercury and the protochloride. By its entirely subliming when pure, non-volatile substances that may have been mixed with it, such as salts of lime, barytes, or lead, may be detected. As calomel is liable to be contaminated with corrosive sublimate, by which mixture it may produce the most dangerous consequences, it is especially important to test it for this salt. A buff color is an indication of freedom from corrosive sublimate, but the very purest calomel, as that called Jewell's, is perfectly white. If calomel is washed in warm distilled water, and a white precipitate should fall on the addition of ammonia, this indicates the presence of corrosive sublimate. Caustic potash may also be used instead of ammonia, and will give when corrosive sublimate is present a yellow precipitate.—Various processes are given in the pharmacopœias for this preparation. The most common method is by sublimation. This may be done by mixing 4 parts of corrosive sublimate with 2 parts of mercury, and rubbing them together until the metallic globules entirely disappear, and then subliming. The product should be powdered and washed with boiling water to free it from corrosive sublimate. The process of the "U. S. Pharmacopœia" is as follows: "Take of mercury 4 lbs., sulphuric acid 3 lbs., chloride of sodium 1½ lb., distilled water a sufficient quantity. Boil 2 lbs. of the mercury with the sulphuric acid until a dry, white mass is left. Rub this, when cold, with the remainder of the mercury in an earthenware mortar, until they are thoroughly mixed; then add the chloride of sodium, and rub it with the other ingredients till all the globules disappear; afterward sublimate. Reduce the sublimed matter to a very fine powder, and wash it frequently with boiling distilled water, till the washings afford no

precipitate upon the addition of solution of ammonia; then dry it." A mode of preparation in the wet way is recommended by Professor Wheeler in the "Chemical Gazette" of July, 1854. The commercial corrosive sublimate is dissolved in water heated to 122° F., and sulphurous acid gas, obtained by heating coarse charcoal powder with concentrated sulphuric acid, is passed through the hot saturated solution. Calomel in the form of a delicate powder and of a dazzling whiteness, which glistens in the sunlight, is precipitated. The liquid, when saturated with the gas, is digested for a time, and when cooled is filtered from the calomel, which is afterward washed. This process has the advantage that it is easily available for making calomel in small quantities. The calomel of Mr. Joseph Jewell of London, sometimes called Howard's, which possesses the highest reputation, is prepared by causing the vapor to come in contact with steam in a large receiver. It is thus entirely washed from corrosive sublimate, at the same time that it is condensed into an impalpable powder. Its extreme fineness appears to give it more activity as a medicine than is possessed by the calomel obtained by levigation and elutriation.—In the use of calomel as a medicine, particular attention should be given to its liability to generate corrosive sublimate by decomposition. This effect may be produced by bitter almonds or cherry-laurel water, or any other substance containing hydrocyanic acid, being administered simultaneously with it. Nitro-muriatic acid produces the same effects, as also, to some degree, the chlorides of potassium, sodium, and ammonium. It is rendered ineffectual by the alkalies and alkaline earths. Calomel is regarded as the most valuable of the mercurial preparations, though the homeopaths and some other medical innovators reject it. It is employed as a purgative, operating chiefly upon the liver by stimulating its secretory functions. Being slow in its action, and liable to salivate if too long retained, it is usually administered with some other cathartic. It is also given as a remedy for worms, and as an alternative in derangement of the liver in small doses administered once in 24 or 48 hours. In yellow and malignant bilious fevers, violent dysentery, and malignant cholera, it has been effectually administered in repeated doses of 20 grains or more each. This use of it is much approved in hot climates, though not so well adapted to colder latitudes.

CALONNE, CHARLES ALEXANDRE DE, a French statesman, born in 1734, at Douay, died Oct. 30, 1802, in Paris. Belonging to a good family he was appointed to several judicial offices, in which he gave evidence of quickness of mind, boldness of conduct, and easy conscience. This became especially apparent in the prosecution against La Chalotais, attorney-general of Brittany, in which he played a part neither just nor honorable. But he had meanwhile secured the favor of influential persons, such as the count of Vergennes, secretary for foreign affairs, and

ingratiated himself with the second brother of the king, the count of Artois. He had impressed them with such a high opinion of his political talent and financial capacity, that they judged him the only man able to overcome the difficulties which Necker himself had only succeeded in postponing. He was consequently, in 1783, appointed comptroller-general of finance. His first acts seemed fully to justify the anticipations of his protectors; money was abundant in the treasury; Calonne showed himself ready to gratify the most extravagant wishes of the queen and the princes; no comptroller had ever been so popular among the courtiers; and consequently none was reputed so skilful. But this seeming prosperity had been procured, not by fostering true wealth in the nation, but by the dexterous management of extraordinary resources, the frequent and at first successful negotiation of loans, and the exhaustion of all branches of the revenue. Such a system, the only consequence of which was to increase the deficit at a fearful rate, could not last long. The hour of reckoning came. Calonne, being at his wits' end, resolved to adopt the desperate means of summoning an assembly of notables. The session opened Feb. 2, 1787; the comptroller came out with his wonted boldness, unravelled the difficulties of the situation, acknowledging that within the last few years the loans had amounted to 1,250,000,000 livres, while the annual deficit had increased to 115,000,000, and declared that the only remedy was to reform altogether the financial system by extending the taxes over the property of the nobles and clergy. These astounding disclosures, coming from such a man, fell like a thunderbolt on the court; a hue and cry was raised against Calonne, whom the king at once dismissed from office and exiled to Lorraine. He afterward removed to England, where he wrote several memoirs justificative of his administration; but he had to contend against Necker and several other able financiers, and could not but come out second best. His reputation for ability was not, however, entirely ruined, and he afterward became a most active agent of the French *émigrés* at Coblenz. As an adviser of his protector, the count of Artois, he now evinced the same boldness and ingenuity, but also the same levity, as in his former life. He ultimately separated in disgust from his party, and asked from the first consul, Bonaparte, permission to return to France. This was granted, but death overtook him a few weeks after his return.

CALORIC (Lat. *calor*, heat), the name formerly applied to an imaginary material substance, supposed to be the cause of the phenomena of heat. As now used, it is synonymous with **HEAT**, which see.

CALORIMETER (Lat. *calor*, heat, Gr. *μετρον*, measure), an instrument for ascertaining the amount of heat in bodies. The first used for this purpose was contrived by Lavoisier and

Topless, and was directed to determining the comparative quantity of heat developed by the combustion of definite amounts of fuel. The combustion of this was effected in a cylinder, which was let down into a larger one filled around with pounded ice. Another outer cylinder of all also contained ice, which prevented that in the middle cylinder from being affected by the external temperature. The heat from the innermost vessel caused the ice to melt in the cylinder next to it, and the water thus produced ran off through a pipe passing through the bottom. Every pound of this they calculated represented an amount of heat sufficient to raise a pound of water from 62° F. to 185° , or 123 lbs. one degree. Forstays, Desains, Regault, and others, subsequently corrected this calculation, proving that the heat which melts one pound of ice will raise the same quantity of water to 142° . The practical application of this principle, however, did not give correct results, all the water not leaving the ice. Rumford introduced a better method by substituting water for the ice, and ascertaining by a delicate thermometer the increase of temperature in a definite weight of this, caused by the absorption of the caloric. It was on this principle that the improved apparatus of Favre and Silbermann, made use of in their experiments, was founded. The innermost vessel, of gilt sheet brass, shaped like a flask, was sunk, except its projecting neck, in a cylinder of silvered sheet copper containing water, which was placed in a larger cylinder, the space between them all round, and at top and bottom, being filled with swan's-down. Both cylinders were covered with lids provided with apertures for the insertion of tubes and thermometers. One of these tubes, entering the flask near the bottom, served to convey oxygen gas for supporting combustion. The gaseous products passed into another tube, which, emerging from the shoulder of the flask, bent over, and passing through the water, was cooled around under the flask like the worm of the still. It then passed up through the top to a gasometer or no absorbing apparatus. A flat metallic ring, nearly the diameter of the water cylinder, lay at the bottom of the water; and being provided with a rod for a handle which passed up through the top, it could be moved up and down, to thus equalize the temperature throughout the liquid. The gases to be tested were introduced into the flask by a small tube entering its neck and turning up at the bottom to form the jet. Solid bodies were suspended by fine platinum wires; liquids were burned in small capsules, or in lamps with asbestos wicks; charcoal was laid on a sieve-like shelf, the oxygen coming up through it. Thermometers introduced into the water indicated its increase of temperature.—For ascertaining the heat generated where no gases are evolved, these chemists employed a glass globe filled with mercury, and having a tube inserted so as to hold, near the centre of the globe, the sub-

stances to be tested. The globe was provided with a spout like that from a tea-kettle, and in the top of this was inserted a thermometer tube, which, bent at right angles, served on its horizontal limb to measure the expansion of the mercury.

CALORIMOTOR (Lat. *calor*, heat, and *motor*, to move), that form of the galvanic battery by which its plates, few in number, but of great size, are made to evolve an intense degree of heat, making metallic wires red hot, and igniting inflammable bodies. The arrangement of the apparatus, made with this object, was invented by Dr. Robert Hare, and was described by him in a paper read before the academy of natural sciences, Philadelphia, and also published in the "American Journal of Science" (1816), vol. 3, p. 415. See **BATTERY**, and also **ELECTROLYSIS**.

CALOVIVUS, ABRAHAM (German, CALOV), a German Lutheran divine, born Aug. 16, 1612, at Mohrungen, in Prussia, died in Wittenberg, Feb. 25, 1696. He was rector at Danzig, and professor of theology at Wittenberg; engaged in numerous theological controversies, conducted with much intemperance on each side; was a rigid adherent of his sect, and opposed the Socinians, and also the conciliatory views of George Calixtus to which he was the first to apply the name of Syncretism.

CALOYERS, or **CALONITAI** (Gr. *erlos ymas*, a handsome old man), Greek monks, mostly of the order of St. Basilian. Their principal convents are on Mount Athos, and are especially resorted to by young men of good family, who find there excellent teaching, and a reputable mode of life. The pupils not only read the Greek fathers, but other Christian writings; and those who desire it, receive a systematic course of theological instruction. The regular clergy of the Greek church is generally recruited here. Those who prefer monastic life are bound to celibacy, to abstain from meat, and observe 4 fasts in the year, beside other fasts. They wear a dark cassock, with a belt and a hat ray of the same hue. This is also the costume of the secular clergy, except a white band round the lower part of the cap. Some convents of Caloyers are to be found in the Morea; but they are, in point of learning and discipline, inferior to their brethren in the north. Among the Caloyers, beside those who live in congregations, there are anchorites, who prefer dwelling alone, or with 1 or 2 companions, in hermitages; and recluses, who live in grottoes or caverns, on alms furnished to them by the monasteries. There are also convents of female Caloyers.

CALPE, the ancient name of the rock of Gibraltar, at the S. extremity of Spain, the northern of the 2 hills called by the ancients the pillars of Hercules. Across the straits of Gibraltar, on the African coast, was Abyla, the southern pillar.

CALPER, or **KALPER**, a town of British India, in the district of Bundelcund, presidency of Bengal, situated on the right bank of the

Jumna, 45 miles S. W. of Cawnpoor. It is a large, populous, but ill-built town, with a fort commanding the passage of the river, advantageously situated, but of no great strength. The town was once a place of more note than at present, and was the seat of a mint. It is still an important depot for the cotton trade of Bundelcund, and is famous for the manufacture of remarkably fine refined sugar. Paper-making is also carried on to some extent. Pop. in 1853, 21,812.—Calpee is said to have been founded as early as the 4th century, by a sovereign of Cambay. After passing through many hands, it was taken from the Mahrattas by the British in 1778, was subsequently relinquished, and in 1802 was again acquired by the East India company by the treaty of Bassein. It was at that time occupied by Nana Govind Rao, jaghiredar of Jaloun, who refused to give it up to the British, and was accordingly besieged, and finally forced into submission. In 1857 it became a place of rendezvous for the disaffected sepoys, and by the spring of 1858 an army of mutineers, said to be 10,000 strong, had assembled there under the command of the rajah of Jhansi and several other native princes. Sir Hugh Rose marched against them from Jhansi, May 26, defeated a force of 7,000 stationed on the road to oppose him, and reaching Calpee, captured it after some hard fighting. The sepoys took to flight, were pursued, and a large amount of ammunition, stores, and a number of elephants, and guns, fell into the hands of the British. By the accounts, however, which left Calcutta by the mail of June 3, the rebels were reported to have routed the forces of Sindia, and to have marched on Gwalior.

CALPURNIUS, TRIVS JULIUS, a Latin pastoral poet, born in Sicily, lived near the end of the 3d century; 11 eclogues have come down bearing his name. The efforts of German scholars to know more than this have resulted in several different plausible, but imaginary, lives of the poet; and in one instance he has been blotted out from history, and a certain Servanus mentioned by Juvenal substituted in his place. His eclogues, too, have been variously divided and distributed between himself, his contemporaries, and his copyists. There is considerable resemblance between these eclogues and those of Virgil.

CALTAGIRONE, or CALATAGIRONE (perhaps the anc. *Calata Hieronis*), a city of Sicily, in the province of Catania; pop. 21,700. It is built on the slope of a hill, and with its suburbs covers a considerable extent of ground. It is the see of a bishop, and is reputed one of the wealthiest and most commercial towns on the island. Its inhabitants excel in all the useful arts, and many of them find employment in the potteries and cotton factories of the place. There are several churches, convents, and a royal college. The town was fortified by the Saracens, and taken from them by the Genoese. Roger Guiscard granted it many privileges.

CALTANISSETTA, a town of Sicily, capital

of the province of the same name, is situated in a fertile plain near the right bank of the Salso, 65 m. S. E. of Palermo; pop. over 16,000. It is well built, with broad, straight streets, a handsome square, and several fine edifices. In its vicinity are several jets of hydrogen gas, and extensive sulphur works.

CALTROP, a kind of thistle which grows in France and Spain, and is troublesome to the feet of cattle.—In military tactics, an iron instrument with four points, so formed, that, however thrown, one will always project upward. They are used to prevent the onset of cavalry.

CALTURA, a seaport town in the S. W. part of Ceylon, about 28 miles S. E. from Colombo. It has a brisk trade, especially with Madras and the Coromandel coast, and contains a chapel and school established by Wesleyan missionaries.

CALUMET, a kind of pipe, the symbol of peace among the American Indians. The bowl is made of a soft marble, and the stem is usually a long reed adorned with feathers and hieroglyphic figures according to the rank of the owner. The calumet is introduced upon all important occasions when Indian chiefs meet together, or meet with whites. It is filled not only with tobacco, but with the leaves of various other plants, and is passed round for every member of the company to take a few whiffs. To receive the calumet when thus passed signifies that the terms proposed are accepted.

CALUMET, an eastern county of Wisconsin, along the eastern shore of Winnebago lake; area, 360 sq. m.; pop. in 1855, 3,631. The surface is mountainous, a high ridge running across the county nearly parallel with the lake. The soil yields excellent crops of corn, wheat, barley, oats, and hay. Timber is abundant, and pasturage is good. The productions in 1850 were 7,827 bushels of wheat, 3,428 of oats, 10,532 of Indian corn, 8,887 of barley, 9,116 of potatoes, 846 tons of hay, and 21,538 pounds of butter. There were 4 saw mills, 3 churches, and 173 pupils attending public schools. Organized in 1842. Capital, Chilton.

CALUMICK, or CALUMET RIVER, rises in La Porte co., Indiana, flows westward into Illinois, and there divides; one of its branches enters Lake Michigan, the other makes a bend, runs eastward parallel with its former course, and only 3 or 4 miles north of it, recrosses the Indiana boundary, and discharges its waters into Lake Michigan, in Lake co.

CALVADOS, a maritime department of France, divided into 6 arrondissements: Caen, Falaise, Bayeux, Vire, Lisieux, and Pont l'Évêque, bordering on the English channel, and deriving its name from a long reef of rocks on its coast. It is watered by several rivers, the most important of which is the Orne, but none of them is navigable for any considerable extent inland. The climate is rather cold and moist; the surface, which in some parts is intersected by elevated hills, possesses fine plains and beautiful valleys, among which that of Auge is cel-

mented. Agriculture is in an advanced state, there being a large surplus of wheat for exportation; the crops of barley, rye, and buckwheat are considerable, but that of oats is insufficient for home consumption. Excellent apples are cultivated every where, principally to make cider, which is the common beverage of the country. Few, if any, departments of France can compete with this in live stock. The horses are reckoned the finest in France. Numerous herds of cattle are fattened in the valleys for the markets of Paris, Rouen, and Caen. Some manufactures are successfully carried on, especially lace; many hands are also occupied in the spinning and weaving of cotton and wool; there are, besides, factories of cutlery, hardware, earthenware, paper mills, &c. The total value of the raw material consumed averages about \$10,000,000, and of the manufactured articles, \$15,000,000 annually, giving employment to about 20,000 persons, whose average daily wages are about 50 cents for men, 25 cents for women, and 17 cents for children. The mackerel and herring fisheries are extensively carried on along the coast. Although destitute of good ports, this department has a considerable export trade with several countries of Europe and the United States, mostly carried on through Havre. Area, 2,145 sq. m.; pop. in 1856, 472,297.

CALVAERT, or **CALVART**, **DENYSIUS**, surnamed **DIOMISIO FRAMINGO**, a painter of the Bolognese school, born in Antwerp in 1555, died in Bologna in 1610. He had a school in Bologna, through by pupils, including Gallo, Albani, and Dussoldobio.

CALVARY (the Latin translation of the Hebrew word *Golgotha*, meaning the place of a skull) was, 1,000 years ago, a pebbly and arid little hill on the north of Jerusalem, just outside of the walls. It was a tradition that Adam was buried there, and that Abraham led thither his son to the altar of sacrifice. It was the place of public execution among the Jews, and a large vacant space was left between the mount and the wall of the town for the presence of spectators. The other sides of the eminence were occupied by gardens. Calvary was the scene of the crucifixion of Jesus Christ, whose body was laid in a sepulchre prepared in a garden near by, which belonged to Joseph of Arimathea, a secret disciple. Since that time the face of this region has much changed. Neither agriculture nor trade flourishes in the vicinity. Thus destroyed the temple of Jerusalem, and Hadrian demolished the city itself. The latter, wishing to blot from the Jewish mind the traditions of their sacred places, created a statue of Jupiter upon the holy sepulchre, and of Venus upon the summit of Calvary. But within two centuries these were overthrown, and the place of the latter occupied by the church of the Holy Sepulchre. In the wars of the Mohammedans and the crusaders this was repeatedly destroyed and replaced; and while the mount was occupied by the Christians, they

erected the stately temple, the walls of which still remain.

CALVERT, a southern county of Maryland, on the shores of Chesapeake bay; area, 250 sq. m. The Patuxent river forms its western boundary, and empties into the bay at the southern extremity of the county. The surface is rolling; the soil is good, and much improved by the application of manure, which is found here in considerable quantity. The productions in 1850 were 3,109,258 lbs. of tobacco, 361,800 bushels of Indian corn, 67,430 of wheat, and 23,844 of oats. There were 35 grist mills, 1 saw mill, 11 churches, and 375 pupils attending public schools. The county was formed in 1654, and named in honor of the family to which Lord Baltimore belonged. Pop. in 1850, 9,645, of whom 4,458 were slaves. Capital, Prince Frederick.

CALVERT, the name of a distinguished English family, descended from an ancient and noble house of the same name in Flanders, and connected for several generations with the colonial history of Maryland.—Sir George Calvert, the first baron of Baltimore, born at Kipling in Yorkshire, about 1582, died in London, April 15, 1632. He graduated at Oxford in 1597, when but 15 years old. According to the custom of the time with persons of rank, he was sent abroad to travel, and on his return was appointed secretary of Robert Cecil, afterward earl of Salisbury. On Cecil's appointment as lord high treasurer, Calvert still continued in his service. At a subsequent period, Cecil procured for Calvert one of the clerkships of the privy council. He received the honors of knighthood in 1617, and James I. appears to have always held a high opinion of him. At length he was appointed one of the 2 secretaries of state, and in 1620 he was granted an annual pension of £1,000. Five years after this time, he took refuge from the religious controversies which distracted parties, by joining the Roman Catholic church; a movement which, however, did not bring him into disfavor with James. Of late years some controversy has arisen between Protestant and Catholic writers, in regard to the account of his conversion. At the date of the Ayalon charter, he is generally reputed to have been of the Protestant faith, but says Fuller, in his "Worthies of England," when he resigned his post of secretary of state in 1624, "he freely confessed to the king that he was then become a Roman Catholic." This passage is the chief authority for his conversion; but those who disbelieve the story of Calvert's change of creed, maintain that the author of the "Worthies" has not sufficient ground for his statement, and in short that Calvert was never converted at all, having always been a Catholic. They base their arguments on the fact that he settled his colony in Newfoundland in 1621, he having a wish, according to Oldmixon and Borman, to found an asylum for persecuted Catholics, and therefore he must have been a Catholic then, 2 years before the date

assigned by Fuller. They further assert that his 12 children were all brought up in the Catholic faith, no record whatever of their conversion existing, and his marriage with Anne, daughter of George Mynne of Hertfordshire, and granddaughter of Sir Thomas Wroth of Duranco, in Enfield, Middlesex, having taken place in 1604-'5. Their strongest arguments, however, are the repeated declarations of the king against Catholics, those who were apostates from Protestantism falling under his severest displeasure. In his speech delivered at Whitehall on the opening of parliament in 1609, he says, "I divide all my subjects that are papists into 2 ranks: either old papists that were so brought up in times of popery, and those that be younger in years, yet have never drunk in other milk; or else such as do become apostates, having once been of our profession and have forsaken the truth. . . . For the former sort, I pity them, but if they be good and quiet subjects, I hate not their persons. But as for these apostates, who I know must be the greatest haters of their own sect, I confess I can never show any favorable countenance toward them;" and in 1616, in his star chamber speech, he says: "I can love the person of a papist, being otherwise a good man and honestly bred, never having known any other religion; but the person of an apostate papist I hate." In spite of such sentiments Calvert always retained the king's regard. Catholic writers, however, insist upon the conversion, and bring forward testimony in turn to support their assertions. The king retained Calvert in the privy council, although he resigned his place as secretary of state, and in 1625 he was elevated to the Irish peerage by the title of baron of Baltimore, in the county of Longford, Ireland. Calvert had long been imbued with the idea of planting colonial establishments in America, and obtained a patent from King James which created him sole lord and proprietor of a part of the island of Newfoundland, and with all the rights and privileges of nobility. To this place, which was styled Ferryland, he sent a colony in 1621, and he spent of his own fortune full £25,000 in building warehouses and granaries, as well as a superb mansion for his own accommodation. He followed in 1625, about the time of King James's death, but was completely disappointed with Newfoundland, the climate proving too severe for English constitutions, and the soil too rugged to be worked with profit. After remaining a few years, he abandoned the colony and sought a more genial clime. In 1628 he visited the Virginia settlements and explored the waters of the Chesapeake bay, delighting in its magnificent expanse and noble tributaries, and in the delicious climate and the naturally fertile lands of that fair region. The waters of the bay and its rivers abounded with fish and wild fowl, and the woods were vocal with the song of birds. A tradition exists to this day in Maryland, that Lord Baltimore was charmed with the appearance of the oriole (*pyrrhula Baltimore*) giving

it his name, and choosing its brilliant black and orange plumage for his livery. But the reception he met in the Virginia colony was by no means cordial; there the church of England party had full sway, and the authorities tendered to him the oath of supremacy, which as a Roman Catholic he could not take, and in his disappointment it is supposed that he formed the plan of obtaining a new charter from Charles I., and seeking to plant a colony in a more southern latitude. From 1628 to 1632, little is known respecting Lord Baltimore, but he is supposed to have returned to the settlement in Newfoundland, as history relates that he rendered service in the war then carried on between England and France, and he is said to have rescued 20 sail of fishing vessels (those of Newfoundland at the time being upward of 250 in number), after they had been captured by a French squadron. He returned to England, and in the latter year applied to the king for a renewal of his former charter, with the privilege of a new location, and his petition was acceded to. Steps were taken toward the drawing of the papers, and there is no doubt that the draft of the charter "was penned by the first Lord Baltimore himself, although it was finally issued for the benefit of his son." The territory granted was that which now forms the states of Maryland and Delaware, but Lord Baltimore died before the papers could be duly executed. Though anxious for the hereditary privileges of nobility, the character of Calvert will ever shine as that of one who cherished liberty of conscience. In this respect he was in advance of the general bigotry of his time, and his memory is accordingly revered, not only by the people of Maryland, but by all who are interested in the history of civil and religious freedom. A complete life of Lord Baltimore is now (1858) in course of preparation by Mr. Sebastian F. Streeter of Baltimore.—Cæcilius, son of the preceding, and the 2d baron of Baltimore, born in 1623, died in 1676. On June 20, 1632, the charter which had been intended for his father was executed for him by the command of Charles I. It consisted of 23 sections, the 4th of which conferred on Lord Baltimore and his heirs forever, absolute ownership of the territory granted, and also certain civil and ecclesiastical powers, like those derived from the middle ages and continued in the families of the most powerful nobility. The manner in which this design of fastening upon the colony the institutions of the feudal system was defeated, forms a very interesting feature in the early history of Maryland. The name first intended for the colony was *Orescentia*, but Maryland was adopted instead, in compliment to the queen, Henrietta Maria. The relations which Calvert as proprietor bore to his sovereign are expressed in the charter in the obscure language of such instruments in that age, but its meaning is, that by the annual payment of 2 Indian arrows, Lord Baltimore acknowledges that the original title to the land is still in the possession

of the king, and that the soil granted to him yet belongs to the British empire. Native exemption from taxation was conceded to the colonists, the very point which, a century and a half later, led to the American revolution. Lord Baltimore did not emigrate to America, but gave the management of the colony to his brother.—LEONARD, brother of the preceding, first governor of Maryland, died June 9, 1647. For some reason Lord Baltimore decided not to go in person to plant the Maryland colony, and his brother Leonard was accordingly deputed to conduct the expedition. The first emigrations took place in 1633, 12 years after the voyage of the *Mayflower* to Plymouth, and consisted of about 300 persons. Among them were 3 Jesuits, one of whom, Father White, corresponded with the superior of his order in Rome. A copy of his letters has recently been obtained, and although principally relating to the work of the mission among the Indians, they contain an interesting and authentic account of the first settlement in Maryland. On Nov. 22, 1633, the Maryland pilgrims sailed from Cowes, Isle of Wight, in 3 small vessels: the *Ark*, a ship of 300 tons, and the *Dove*, Lord Baltimore's pinnace, of about 50 tons. They sailed by way of the Canary islands, and were 3 months upon the voyage, although they were at sea only 7 weeks and 3 days. They suffered considerably from bad weather, and Father White says "it seemed as if all the spirits of storms, and the evil and malignant geni of Maryland, had come forth to battle array against us." From the Canaries they steered for Barbadoes, and after touching there and at 1 or 2 of the neighboring islands, they reached Point Comfort in Virginia, Feb. 24, 1634. Here they were entertained for some days, and on March 3 sailed up the Chesapeake and into the Potomac, landing at an island which they called St. Clement's, and on the 25th of the month, "the day of Annunciation of the Holy Virgin Mary, offered in this island, for the first time in this region of the world, the sacrifice of the mass." A large cross hewn from a tree was then set up, and "we raised it a trophy to Christ the Saviour, humbly chanting on bowed knees, and with deep emotion, the litany of the cross." Proceeding from this island about 9 leagues toward the north, they entered a river which they called St. George's. "Two bays appear at its mouth, capable of containing 500 of the largest ships. One of the bays we consecrated to St. George, the other more inland to the Blessed Virgin Mary. We landed on the right bank, and having advanced about 1,000 paces from the shore, we gave the name of St. Mary to the intended city." Appropriate religious and military ceremonies accompanied the act of taking possession, March 27, 1634; the men were drawn up on the shore and fired volleys of musketry, while the cannon answered from the ships. Of this city of St. Mary's at the present day scarce a trace remains, and by a stranger even its site would be unnoticed.

While the missionaries were making friends with the Indian tribes, Calvert found much to harass him. Before his arrival, Kent Island in the Chesapeake bay, situated nearly in the centre of Lord Baltimore's province, had been occupied by a certain William Clayborne, and this man was the source of much trouble to Calvert during his whole life. When the patent was made out for Lord Baltimore, Kent Island became a part of Maryland, and Clayborne owed allegiance to Calvert as proprietary. It seems that his character as a bold, unscrupulous man was known to Lord Baltimore before the colonies sailed from England, and the proprietary had issued orders that if he attempted to resist the authority of his brother Leonard, he should be seized and punished. Clayborne, however, did not wait for any summons to surrender, but declared war on his own account against the settlers at St. Mary's. There is abundant reason to believe that he was abetted in his designs by the Virginia authorities at Jamestown, who looked with an evil and jealous eye on the success of Maryland. Clayborne fitted out an armed pinnace, manned by 14 men, and on April 24, 1635, his force engaged 3 other pinnaces prepared by Gov. Calvert to resist his aggression. Clayborne's vessel was captured, with a loss of several men, and he himself fled to Virginia, whence he was deported to England. In 1638 he presented a petition to the king, setting forth his grievances, which however obtained him nothing, and he returned to Virginia, where, to his mortification, he found that the governor and council of that colony, having now fully recognized Lord Baltimore's rights, forbade any one in their jurisdiction from trading within his domain—Clayborne being thus now restrained by the authorities of Virginia in the very thing in which he had been formerly encouraged. His property on Kent Island had, meanwhile, been declared forfeited by the provincial assembly of Maryland; he petitioned for its restoration, and, as a dangerous rebel, was refused. He eventually sought revenge, as we shall relate in order, and meanwhile retired to Virginia.—As Lord Baltimore belonged to the aristocracy of England, he was anxious, in planting his colony, to establish within it similar hereditary titles and privileges to those which, in the mother country, had come down from the feudal system, and therefore the tenure of lands in Maryland was at first intended to found an order of nobility. He designed that the lands should be owned in large masses, and the original conditions of emigration were in accordance with this plan. In his special order of commission to his brother, dated at Portsmouth, Aug. 8, 1635, he renews these conditions, and had these provisions been fully established, a great part of Maryland would have been parcelled out in grants of 2,000 or 5,000 acres of land, giving, in their proprietors not only the rights of soil, but of holding courts and seats in baron to decide upon personal claims, and also of property. These rights of

jurisdiction were to descend from the original owner to his heirs. In order, however, to found an aristocracy upon a solid basis as it existed in England, it was also necessary to establish titles, primogeniture, and hereditary legislation, such as is perpetuated by a house of lords. The provision for titles and dignities had been sketched by Lord Baltimore, but he could not secure the other provisions without a written constitution, expressly enacting all the features of a body of aristocracy. Beside, in the charter itself was a provision which, in effect, nullified the one for creating an aristocracy, inasmuch as it prescribed that laws could only be made with "the advice, assent, and approbation of the freemen of said province, or of the greater part of them, or of their delegates or deputies." The idea of founding an aristocracy seems, from the very first, to have been of no effect, as no single title was ever created, and none recognized, but that of the proprietary himself; so that in due time, when the country revolted against the authority of England, Maryland was found to be as democratic as any of her sister colonies. It is true that in some of the early manors baronial courts were held. A record of one is still preserved, and runs as follows: "A court baron was held at the manor of St. Gabriel, on March 7, 1656, by the steward of the lady of the manor, when one Martin Kirk took of the lady of the manor, in full court by delivery of the said steward, by the rod, according to the custom of the said manor, one message, lying in the said manor, by the yearly rent of ———; and so the said Kirk, having done his fealty to the lady, was thereof admitted tenant." Such instances were, however, very rare; and moreover, a difference springing up between Lord Baltimore and the colonists, as to the right of originating laws, many of the acts of the assembly of 1687, among which were 6 relating to manors, never took effect, and there was no after attempt to revive them. The manors, in fact, intended to lay the foundation of powerful families, were soon subdivided, and became mere farms belonging to the different descendants of the original proprietors. The last one ceased to exist in its entirety with Charles Carroll of Carrollton, the latest surviving signer of the declaration of independence, although a part of it now forms a fine estate in the possession of his grandson, and is styled "The Manor." Meanwhile, the troubles in England between the king and parliament, ending in 1648 in the overthrow of the monarch and the aristocracy, had great effect upon Maryland in frustrating the design of establishing nobility.—Much trouble was experienced in the early days of the colony in regard to the laws intended to govern it. Had Lord Baltimore accompanied the expedition, he would have been able to see what laws in the infancy of the colony were necessary, and what were expedient. But, at the last moment, he decided to remain, so that the one who was most important to the law-making power was not to be communicated with under 3 or 4

months, and it was soon found that the legislation of the proprietary in England for an American colony would not answer. The difficulty was also increased by the vague terms of the charter, which did not clearly express whether the laws were to be originated by the colonists or the proprietary. On this account, for several years the colony held together without any laws at all, but in great danger of anarchy. Finally, Lord Baltimore magnanimously withdrew from what he considered his just right, and conceded to the colonists permission to frame their own laws, reserving only to himself, or his deputy, a veto in case of necessity. After the assembly of Maryland had been fairly organized, several laws were passed in relation to religion, which by some writers have been made the subject of extravagant praise, while others have unjustly neglected to award them due merit. It does not appear that Lord Baltimore, or any of the settlers, had an intention on founding the colony of proclaiming absolute religious freedom, and one of the first acts of the assembly of 1639 was to make the Roman Catholic religion the creed of the state. But the true glory of the Catholics of Maryland, in that age of intolerance, was their permission for all bodies of Christians to worship God according to their conscience. In "an act for the liberties of the people," it was declared that "all Christian inhabitants (slaves excepted) are to have and enjoy all such rights, liberties, immunities, privileges, and free customs within this province, as any natural born subject of England hath or ought to have." At the same time, to show that the Roman Catholic faith was predominant, eating flesh in time of Lent was forbidden, under penalty of a fine, and this was obligatory on Protestants as well as Catholics. Some 10 years after this time another law was passed, which expresses even more clearly the rights of Protestants, and breathes the purest spirit of religious freedom. A portion of it declared that "no person or persons whatsoever, professing to believe in Jesus Christ, shall from henceforth be any way troubled, molested, or discountenanced, for and in respect of his or her religion, nor in the free exercise thereof, nor in any way compelled to the belief or exercise of any other religion, against his or her consent." At the same time it was forbidden to blaspheme against the blessed Virgin Mary, or the apostles or evangelists, or to reproach any one with the epithets of heretic, schismatic, or idolater, or for being a "Puritan, Independent, Presbyterian, Popish priest, Jesuit, Jesuited Papist, Lutheran, Calvinist, Anabaptist, Brownist, Antinomian, Barrowist, Roundhead, or Separatist." The toleration thus freely granted continued always to be enjoyed, and redounds to the honor of the colonists, and no less of Lord Baltimore; but the claim of absolute religious freedom, that is, dissolution of all connection between church and state, did not, as some zealous writers have endeavored to prove, originate in Maryland. To Roger Williams, the founder of Rhode Island,

In this hour, dear, and to his sleep. As the settlements of the whites extended in Maryland, the Indians, who for a number of years had preserved friendly relations with them, became troublesome, and as early as 1639 it was found necessary to pass a "act for military discipline." Troubles with the natives continued to increase for several years, and reached their height in 1642. Aid on several occasions was sought from Virginia, and in 1648 the natives were shut out of the province, or rather that part of it forming a peninsula, from tide water on the Patuxent river by a direct line crossing to the Potomac.—During the 9 years which had now elapsed since the landing of the Maryland pilgrims, a great change in political affairs had taken place in England; the king had been deprived of nearly all power, and was about entering on that civil war which cost him his throne and life. The colonists were more or less affected by the convulsion, and Maryland in an especial degree. Lord Baltimore and his brother Leonard had every reason to fear that they would be deprived by parliament of all their rights and possessions in the new world, the proprietary being strongly interested in the royal cause. Leonard Calvert, in order, doubtless, to consult with his brother, and shape his conduct for the future, visited England in 1649, returning the following year. In his absence much trouble was experienced from the conduct of one Ingle, and this man, in connection with Calvert's old enemy, Clayburne, harassed the settlement at St. Mary's. On the governor's return, he found every thing in confusion, and although he brought a new commission from his brother, confirming him in all his previous powers, Clayburne, in connection with Ingle, who is supposed to have been little better than a pirate, regained possession of Kent island, invaded the western shore of the Chesapeake, and expelling the proprietary government, compelled Gov. Calvert to retire to Virginia. Among other property, the colonial records fall into the hands of these misdoers, and were greatly mutilated, and in part destroyed. This happened in 1645, but 2 years after Leonard Calvert returned with a strong military force, took possession of Kent island, and reestablished his rights over the entire province. But Calvert had probably been much afflicted, and his various anxieties both for the state of England and of Maryland doubtless hastened his end. The circumstances of his death are unknown, only that he named a successor as governor, Thomas Green, and died on June 9, 1647. It is greatly to be regretted, that at this day such meagre records exist for memorials of Leonard Calvert and his brother, Lord Baltimore; but, "together they raised up a community unsurpassed in this western world for order, harmony, and general prosperity; and the scanty materials of its early history are in no small measure owing to the fact that, as history deals principally in wars and calamities, the happiness of the early inhabitants of Maryland left little to record."

CALVERT, GEORGE HENRY, an American author, born in Baltimore, Md., in 1800. His father's ancestors were distinguished both in colonial and European history, and his mother was a native of Antwerp, and a direct descendant of the painter Rubens. He graduated at Harvard college in 1823, and afterward studied at Göttingen in Germany. On returning to America, he edited for several years the "Baltimore American" newspaper. In 1832 he published his "Illustrations of Phrenology," the first American treatise on the subject; in 1830, a "Volume from the Life of Robert Barclay;" in 1836, a metrical version of Schiller's *Don Carlos*; in 1840, a fragment on "Arnold and André," 2 cantos of "Cabiro," a poem in the stanza of "Don Juan," and a tragedy entitled "Count Julian." He soon after again visited Europe, and, in his letters to the "Baltimore American," was the first to announce and discuss in this country the theory of the water-cure. He translated and published in 1845 a portion of the correspondence between Goethe and Schiller, and in 1846 and 1852 published 2 series of "Scenes and Thoughts in Europe." Hydropathy and the schemes of Fourier were among the subjects which he treated. Except when engaged in foreign travel, Mr. Calvert has resided since 1843 in Newport, R. I., of which city he was mayor in 1853. In the same year he was the orator at the celebration of the 40th anniversary of the battle of Lake Erie. He has contributed occasionally to the "North American Review," "Putnam's Monthly," and other literary periodicals.

CALVI, LAZZARO AND PAVCALONCO, two Genoese painters, sons of Agostino Calvi, of whom the former was born in 1502 and died in 1560, and the latter died in 1595. They painted in concert many pictures in Genoa, Monaco, and Naples. In particular, the façade of the Palazzo Doria (now Spinola), a spirited composition crowded with figures, is highly extolled. Lazzaro was the more inventive genius of the two, his brother generally working out the details of their joint productions; but his disposition was envious, and his career was marked by atrocious crimes. Having failed in competition with Cambiaso to secure the execution of the frescoes in the church of St. Matteo, in Genoa, in a fit of rage he renounced his art, and for 29 years followed the calling of a sailor. At the end of this period he resumed his pencil, and continued to paint until his 85th year.

CALVIN, JOHN, the theologian and organizing genius of the Reformed churches, was born at Noyon, near Paris, July 10, 1509, died in Geneva, May 27, 1564. The grandfather of Calvin was a cooper. His father, Gérard Calvin, or Cauvin (sometimes written Calvis), apostolic notary and fiscal procurator in Noyon, was a man of shrewd intelligence; his mother, Jeanne Lantfranc de Coutrais, noted for her beauty and her devotion, induced her son with her own strict religious views. He was educated, at his father's expense, with the children

of the noble De Mommor family. At the age of 12, he was presented by one of this family to the benefice of the chapel de la Gesine, to defray the cost of his education for the priesthood. He was already noted for his memory and diligence, as well as for his moral strictness. Among the youth he was known as the "accusative." Removed to Paris with the De Mommor children, he prosecuted his studies in the collège de la Marche, where Mathurin Cordier, an able scholar, taught him Latin; and then in the collège Montaigu, where a Spaniard initiated him into the scholastic dialectics. At the age of 18, though he had only received tonsure, he obtained the living of Marteville, Sept. 27, 1527, which was in 2 years exchanged, July, 1529, for that of Pont l'Évêque, the village where his grandfather had made wine casks. He preached short sermons, and continued his studies with the greatest assiduity. After a frugal evening repast, says Beza, he would study till midnight, and in early morning before he rose he would review all he had learned the previous day. His ambitious father, foreseeing his fame, perhaps alarmed by the prospective troubles in the church, and thinking the legal profession a surer road to wealth and parliament, now changed his plans, and sent his son to Orleans to study law under that eminent jurist, Pierre l'Étoile (Peter de Stella). This training unconsciously prepared him to be the legislator of Geneva. About the same time the influence of his relative, Robert Olivetan, who translated the Bible into French, led him to question his traditional and unawakened faith. By day he pursued the study of the law, and by night the study of the Bible, with what commentaries he could command, to resolve his growing doubts. In the law he made such progress that several times in the absence of the professor the youthful student was called to fill his place. A radical change in his religious views was marked by what he himself calls "a sudden conversion," which seems to have at once broken the thralldom of the mediæval system. "The secret guidance of God's providence," he concisely tells us, "delivered him from the superstitions of the papacy." Henceforth he sought the society and confirmed the opinions of those who were struggling for the new light. His protracted studies and mental conflicts already preyed upon his health, and his whole subsequent life was a contest with death. His legal and theological studies were continued at Bourges, the former under the learned Italian, Alciati, Melchior Wolmar not only taught him the Greek of the New Testament, but also gave him further taste of heresy. His position in the university was so prominent that he was requested, though only a student, to draw up an opinion, still extant, upon the divorce of Henry VIII., when that question was submitted to the faculty. But zeal for the truth of God had now become, as Bayous declares, the passion of his life. He cheered all of like mind, resolving their scrup-

les; even when he sought quiet, his retreats became, he says, a public school. His native timidity could not bide the shining of the light within him, and many others came to share it. The time of indecision was past; such conflicts, such lingering attachment to the past, as we find in Luther and Melancthon, form no part of the recorded experience of John Calvin. At the age of 20 he was already full-fashioned as a reformer. The death of his father, in 1528 or '30—the date is uncertain—interrupted his university course. For 2 or 3 years we hear little of him. From 1529 he was at least a part of the time in Paris struggling with the reformers. In the midst of persecutions he gave up the legal profession, and devoted himself to theology. The Sorbonne had just proscribed the tenets of Luther. The congregation of Meaux, of some 800 or 400, which even Bishop Briçonnet had at first favored, was dispersed by violence; Farel had fled; Leclero was branded and burnt; Lefèvre was in Navarre; several persons (7 in 1528) had been burned for heresy. Calvin's sermons, usually ending with the words, "If God be for us, who can be against us?" inspired the timid with new zeal. To the imprisoned he sent messages of comfort and hope. The friends of reform looked to him as their champion. At his own expense he now published (April, 1532) an edition of the *De Clementia* of the austere Seneca, perhaps his own model in Latin style. At that time no better philological work had been edited by so youthful a scholar. It has been conjectured that it was intended to move Francis I. to clemency, but the inevitable comparison with Nero was neither flattering nor persuasive; yet the king did not escape the suspicion of being for a time inclined to favor the reform. Next came a bolder venture. Nicolas Cop, a friend of Calvin, just chosen rector of the Sorbonne, delivered, according to the custom at the feast of All Saints, an oration, which is supposed to have been written by Calvin, in which he discoursed, contrary to all precedent, upon the doctrine of justification by faith alone. The amazed and indignant Sorbonne ordered it to be burnt, and Cop and Calvin were obliged to shake off the dust from their feet in a hasty flight, the latter, it is rumored, being let down by the wall in a basket, after the primitive apostolic method. He was welcomed at Nérac by Queen Margaret of Navarre, the sister of Francis I., and the refuge of the persecuted; her own book, the "Mirror of a Sinful Soul," was in small favor at the Sorbonne. In Angoulême, with his friend Louis du Tillet, Calvin distributed sermons among the people and began his "Institutes." The venerable Lefèvre d'Étaples, whom he met at Nérac, at the court of Navarre, in 1533, foretold that this young man would "restore the church of France." Returning to Paris, at great personal risk, he accepted a challenge of Servetus to discuss the positions advanced in his recent work on the "Errors of the Trinity." But

Survivors failed to appear. When they at last met it was in a more tragic encounter. In 1534 Calvin published at Orleans his *Psychopannychis*, in which, with scriptural reasons and elegant logic, he refuted a prevalent Anabaptist tenet, similar to one of Grípen's, that the soul was in sleep between death and the resurrection. By the over-zealous dissemination of the reformed "Planards," in 1545, persecution was again aroused. Calvin, desiring a quiet retreat for study, went first to Strasbourg, where Buczer welcomed him with open arms, and thence to Basel, where Gryssens and Wolfgang Capiton were working for the reform. Under the latter he began the study of Hebrew. The French and German reformers were now at work together. The reputation of Calvin as an earnest reformer and one of the most learned men of the age had preceded him. Johannes von Sturm spoke of him as *contemporis judicis, summusque doctoris, et egregia munera proditoris*. Not only his acumen and learning, but his unsurpassed systematic talents were now to be exhibited in that work which caused Melancthon to hail him as "the theologian," and which brought into one body of divinity the *disjecta membra* of the reformed opinions, scattered throughout central and western Europe. By a thorough study of the epistles of Paul and the psalms of David, by a profound inward experience, by severe training in the forms of logic, by a wide erudition and an unrivalled polemic talent, and by such mastery of the Latin language as was not surpassed even among the Italian literati, he was prepared for the production of a work which at once commanded the attention of Europe and became a bulwark of the reformed faith. No man at the age of 25 has composed a system of philosophy or theology that can be meted with it; solid works of reflection are usually the fruit of much riper years. The youthful aspirant has most need of change; the opinions of Calvin in the edition of 1536 and in that of 1559, the last of his own revision, are unchanged, or changed only as the sailing is changed into the oak. Baza writes: "Though prepared in haste, he never changed any thing;" Scaliger: "He made no retractions though he wrote much." The immediate occasion of the work was the charges circulated against the reformers, concerning them, as a body, of holding the distorted opinions and insurrectionary projects with which one class of the Anabaptists had agitated Germany. Francis I. had lent his authority to the stigma. "Silence would now be treason," said Calvin. The Latin preface of the edition of 1536, addressed to this monarch, refutes the charges and defends the reform with such dignity and method, that it takes rank as one of the three immortal prefaces in literature; that of President De Thou to his "History," and of Cœsambon to Polybina, being those compared with it. The first edition of the "Institutes" was probably published in 1536, in French, and anonymously; no copy of

it is extant. The edition of 1536 was issued at Basel, in Latin; this has 6 chapters; another in 1539 has 17; improved editions appeared during Calvin's life in 1543, 1545, 1549, 1552, and 1559. Numerous editions have been since published, and translations into most of the European languages, and into Greek and even Arabic. A new impression of the edition of 1759, which is considered the most complete, was brought out by Tholuck in Berlin, 1824-'25, and a new edition of Krummhuber's German translation of the same appeared in 1834. The reformation produced no other work so complete and full; Melancthon's *Loci* are but a fragment in the comparison. The theology of St. Paul was here expounded for the illumination of the 16th century; the system of Augustine was revived, without its sacramental grace. In its full form, the "Institutes" is divided into 4 books, treating successively of the knowledge of God as the Creator and Sovereign of the world, of the knowledge of God as Redeemer in Christ, of participation in the grace of Christ, and the fruits thereof, and of the external media (church and sacraments) by which God unites us unto, and retains us in, the fellowship of Christ. The rational power of the work is owing to the fact that it carries one dominant idea through all parts of the system, the idea of the divine sovereignty; and this idea was taken by Calvin, not from the region of speculation, but from his deep religious feeling. If it be a work of one idea, that idea must be confessed to be the grandest of all. For the first time in Christian literature, a system of theology was elaborated in all its parts on the basis of the Divine will as supreme. That will, in Calvin's view, though hidden to us, is not arbitrary, but most wise and holy. The human race, corrupted radically in the fall with Adam, has upon it the guilt and impotence of original sin; its redemption can be achieved only through an incarnation and a propitiation; of this redemption only electing grace can make the soul a participant, and such grace once given is never lost; this election can come only from God, and it includes only a part of the race, the rest being left to perdition; election and perdition (the *horribile secretum*) are both predestinated in the Divine plan; that plan is a decree, and this decree is eternal and unchangeable; all that is external and apparent is but the unfolding of this eternal plan; the church, "our mother," contains only the visible signs and seals of a grace which is essentially invisible; justification is by faith alone, and faith is the gift of God. Such was the stern anatomy of the system of predestination. It went behind the whole outward order of the mediæval church, the papal supremacy, the episcopate and the priesthood, the complicated ritual, the multiplied sacraments, the whole system of meritorious works and of monastic vows; it tested these by the Bible as the only rule of faith, and by the principle that grace is internal

and immediate. The polemical astuteness and doctrinal completeness of the "Institutes" gave it an immediate fame. The reform, supposed to be sporadic, was here concentrated in living unity and vigor. Less heed was given to the comparative neglect of human freedom than to the searching exposure of the vanity of human merit. The sovereignty of God was brought to bear against the supremacy of the pope.—Renée de France, daughter of Louis XII., married to Ercole II., duke of Ferrara, imitating the example as she shared the opinions of Margaret of Navarre, invited Calvin to her court, then the refuge of many of the persecuted. Under the name of Charles d'Espeville he here enjoyed for a short time comparative repose, yet winning Madame de Soubise, Anne and Jean de Parthenay, and others, to the new opinions. The vigilant inquisition, already crushing out Italian reform, soon compelled him to retrace his steps. After tarrying a while at Aosta, he came for the last time to his native place, and arranged his family affairs. Prevented by the war in Lorraine from gaining Strasbourg by the most direct route, he came, in Aug. 1536, not without personal peril, to Geneva, led by a secret providence, which changed all his plans of seclusion, and transformed the nervous scholar into a bold practical reformer. He was now 27 years old. Geneva was to be at once the test and triumph of Calvin's whole system. No place in Europe presented greater difficulties, so sharp was the conflict of its parties, and so corrupt was it in morals; and no place had such advantages as a radiating centre. At this moment it was rent by factions. Delivered from the domination of the duke of Savoy, it had received the reformed opinions through the zeal of William Farel, and in Aug. 1535, established the new service. But the old parties, the Eidgenossen (confederates), and the Mameluks (Savoyards), reappeared under new forms. The city was demoralized; libertinism as to both faith and morals was popular, though the old *conseil général* had been revived, and had already attempted the prohibition of worldly amusements. But the strict party was in the minority, and Farel, ardent in the onset, knew himself unequal to the work of reorganization. Hearing of Calvin's presence in the city, from one who had recognized that pale visage and those keen eyes in a crowd, he besought him to remain; and when he pleaded his need of repose, and desire for study, Farel broke out in a solemn adjuration: "Since you refuse to do the work of the Lord in this church, may the Lord curse the repose you seek, and also your studies!" Calvin yielded, he says, "as if to the voice of the Eternal." At first he would only teach theology, but he preached a sermon, and crowds followed him to secure its repetition; and he was obliged to become one of the pastors. His salary must have been slight, judging from the fact that after 6 months (Feb. 13, 1537), the council voted him 6 crowns, "seeing he had not received any thing." In conjunction with Farel

and Viret, he at once proceeded to the work of organizing the church affairs. In 1537 he published a catechism in French (1538, in Latin), extracted from his "Institutes," "since to build an edifice that is to last long, the children must be instructed according to their littleness." A "Confession of Faith," with articles of strict discipline annexed, had been approved by the council in Nov. 1536, and was read in church every Sunday. At a public disputation with the Anabaptists, March 13, 1537, he put them to silence, so that for many years they were no longer heard of. At a disputation in Lausanne, he spoke against the real presence, and on the authority due the fathers. A certain Caroi accused him, Farel, and Viret, of being Arians, because the words Trinity and person (on which Calvin never insisted) were not in the Genevese creed; but his orthodoxy was amply vindicated at Lausanne and Bern. His great work, however, was the regulation of discipline, according to the principles advocated in his "Institutes." And here he encountered wrathful opposition. Many of the Eidgenossen had joined the reforming party from merely patriotic motives; the remaining partisans of Rome and the Anabaptists made common cause with these Libertines against the plan which was to extend ecclesiastical discipline to all the citizens, banishment being the penalty of obstinacy. Some sumptuary regulations were introduced; games of chance and licentious dances were prohibited anew—they had been repeatedly forbidden since 1487; though Calvin granted that cards and dancing might be innocent in themselves, yet they led to "feuds and quarrels." The Libertines, whom even the secular historians of Geneva accuse of great injustice and corruption, gained the election of Feb. 3, 1538, and at once forbade the ministers to mingle in politics. The ministers then refused to hold communion at Easter, on account of the prevailing immorality; they further refused to restore certain church festivals, to use the baptismal font, and to give unleavened bread in the supper, though a Lausanne council had recommended these things. Calvin was personally not opposed to these rites, but went with his colleagues. Thereupon, April 23, the council banished Calvin and Farel, who departed, saying, "It is better to obey God than man." Zürich and Bern interceded for them in vain; a popular assembly, May 26, confirmed the decree of the council. And Calvin, though he "loved Geneva as his own soul," was glad to return to the life of a student. Expelled from Geneva, he was welcomed at Strasbourg by Bucer. A church of 1,500 French refugees was put under his charge, and adopted his discipline. The city gave him the right of citizenship, afterward prolonged for his life. He was present at the conference between the Roman Catholics and Protestants in Frankfort, 1539, and in that of Worms adjourned to Ratisbon in 1541. Here it was that Melancthon gave him publicly the title of "the theologian." He pre-

pared a treatise on the Lord's Supper (*De Eucharistia*), after a conference with the Lutherans at Haguenau, in 1540, in which he developed his view, intermediate between the Lutherans and Zwinglians, asserting that Christ was spiritually present and spiritually received in the eucharist. He also lectured and published on the "Epistle to the Romans," having modern Rome always in view; since Augustine as commentator had entered more fully and directly into the logic of Paul's argument. Crowds of students, from all parts of France, flocked to his lectures on the "Romans," and on John's Gospel. He was scattering seed far and wide. Here, too, in 1540, he was married to Idelette de Bares, the widow of an Anabaptist, whom he had turned from the tenets of that sect. He had previously refused an alliance with a lady of rank, fearing the disparity of position. Another matrimonial project annuls some of his epistles. But in Idelette he found a most faithful and devoted wife, "who never opposed me," he says, and "always aided me," a *gravis honestaque femina, et lectissima*. A son, who died in infancy, was the only fruit of this marriage. "God gave us," said Calvin, "a little son—he took him away." Idelette died in 1549, and her stern, hard, over-worked husband speaks of his solitude and grief in several touching letters, still extant. To Viret he wrote: "Knowing, as you do, the tenderness, or rather the weakness of my heart, I need not say, that only the strongest effort of mind could alleviate my anguish or keep me from sinking." He was never married again; and 7 years later, in an epistle of condolence, he dwells anew upon his deep-felt grief.—Two years had now passed since Calvin had been driven out of Geneva, and the city had need of him. He had still continued to cherish its welfare, advising his friends to moderate counsel. When Cardinal Sadolet wrote to the Genevans to entice them back to Rome, Calvin replied with such wisdom as extorted praise even from his opposer. The Anabaptists were again restless. Disorders and tumults increased. Of the 4 synagogues who had procured Calvin's expulsion, one had been hung as a traitor, another was killed in an attempted flight, the other 2 had been driven away. As early as Oct. 23, 1540, the council had vainly urged the dissident to return; to another solicitation he replied: "The Genevans would be insupportable to me, and I to them." The city procured the intervention of Bern and Basel; Bucer and Farel entreated; the city of Strasbourg at last allowed him to go, outflowing his salary, which he refused to receive; and Calvin yielded, "offering to God his slain heart as a sacrifice, and forcing himself to obedience." He returned to the city with the acclamation of his people, Sept. 13, 1541, and not only was a "plain house" provided for him, but also "a piece of cloth for a seat." He returned with the full and fair understanding that his discipline was to be carried out. His idea of the proper power and purity of the visible church was

much higher than that of his contemporary German reformers; Möller accuses him of borrowing it from the Roman Catholics. To have a reformed church was his ideal. That reform must embrace not only doctrine and ritual but also the whole life. The most thorough expounder of original sin was the most determined opponent of all actual transgressions. The strictest advocate of Divine sovereignty insisted most strenuously upon man's rigid obedience. The church was the great institution for the regeneration of human society. "Men cannot enter into life unless he be born of her womb, nourished at her breast, and kept under her fostering care." The ministry is divinely appointed. Synods of pastors and elders are for the preservation of truth and order. The state is to aid, and not to rule, this spiritual institution, though both church and state concur in the sphere of morals. Rules of discipline conforming to these radical views were adopted by the whole people, Nov. 20, 1541. The presbyterial system was fully inaugurated, which became a model for the government of the reformed churches in other countries. The consistory had twice as many elders (12) as ministers, and these elders were annually elected by the church. The system of representation was thus established, so fruitful in the subsequent political history of Europe. The consistory met every Thursday to consider cases of discipline. A congregation assembled on each Friday for practical religious improvement. The general council elected by the people continued its functions; but it assembled only twice a year, and the real power was gradually absorbed by the lesser council and by the consistory. The latter was the real tribunal of morals, and its inquisitorial sphere extended to the whole population. It could not punish beyond excommunication; but the civil power was expected to do the rest. The system was a bold one, and for a time eminently successful. Accusations, often frivolous, increased. In 1558-9 there were 414 citations before the consistory. Severe penalties were often inflicted for slight offences; once a person was punished for laughing while John Calvin was preaching. But the effect upon the city was marvellous. It became the most moral town in Europe. It was also the home of letters and the bulwark of orthodoxy. Hooker says: "The wisest that time living could not have bettered the system." Knox, who was 5 times at Geneva, 1554-'6, declared that "it was the most perfect school of Christ since the days of the apostles." And Montesquieu exhorted the Genevans to celebrate as festivals the day of Calvin's birth, and the anniversary of his arrival there. In 1541 Calvin was also appointed on a commission to codify the laws of the state; the code was adopted Jan. 10, 1543. Here, as in the church, the government was aristocratic, with severe penalties. Ancillon says that his "labors for the civil law give him a higher title to renown than his theological works." The same year he published a new and revised liturgy, which was

made the basis of many other reformed liturgies. The public worship was ordered with extreme simplicity, all that appealed merely to the sense and imagination being excluded. Not that he was tenacious in opposition to "things indifferent;" for when consulted in 1555 about the English liturgy, then the occasion of troubles in Frankfort, though he replied that it contained *inoptia*, he added the adjective *tolerabilis*. Such power as Calvin now exercised could not be unresisted, except in a thorough despotism with a standing army. And Calvin had no money, no arms, no family influence, and he never flattered the passions. Beside, he was a foreigner, a Frenchman. The disaffected patriots raised this cry against him, and named their dogs after him. This final opposition of the Libertines, both the political and moral ones, called out all the resources of his now indomitable will. Some of the Libertines were animated by a feeling of patriotic independence; others held to the gross views of the Familists; all joined in the opposition; blood flowed. Perrin was executed in effigy, in 1555, for trying to seize the government. Gruet was decapitated as a materialist, and an enemy of the state. Berthelier, a son of him who had headed the movement for independence against the duke of Savoy, was excommunicated; he appealed from the consistory to the general council, and the council acquitted him. The trial of strength came. All the clergy remonstrated against the decision of the council. Calvin appeared before the 200, and pleaded in vain for the independence of the church. The council still demanded that Berthelier should receive the communion. On the Sabbath, after the sermon, Calvin exhorted the church to partake of the sacrament; but thundered out that "he would sooner die than offer holy things to the excommunicated." Berthelier did not dare approach the table. The council postponed the final decision. The people in the streets still cried, "Slay the alien!" The contest continued for a whole year, but the party of Calvin was strengthened by the naturalization of a large number of Frenchmen, 200 at one time in 1557, and the authority of the reformer was insured. Yet it was far from being absolute even with the consistory. Though he had at one time obliged them to take off a light, and impose a heavy sentence upon Ameaux, who had libelled him, yet they often opposed his views; in one letter he complains that they even subjected his theological works to the censorship. These ecclesiastical and civil disputes were only a small part of his labors. He was also engaged in perpetual theological disputations. Bolsec, once a Roman Catholic and almoner of the duchess of Ferrara, now a convert to the reformed religion and a physician, disputed his doctrine of predestination. After a sharp controversy he was banished from Geneva, became again a Catholic, and wrote in 1577 a life of Calvin, filled with all manner of libels; asserting, for example, that when a young man he had been

branded for a crime against nature. This is refuted by the Catholic historians Masson and De May, though propagated by Richelieu. The Spanish and Italian anti-Trinitarians made much trouble at Geneva. Geibaldi was banished, Gentilis was led for a time to recant. Lælius Socinus came to Geneva even after the execution of Servetus, and subsequently corresponded with Calvin, on the doctrine of election. The most melancholy case was that of the Spanish physician Servetus, burnt at Geneva, Oct. 1553. The party of the Libertines tried to make use of him to defeat Calvin's influence. Calvin himself intereoded in vain to have his punishment changed to decapitation. His condemnation was the act of the council, after a long deliberation, and in accordance with the expressed opinions of other cantons. Bullinger and Melancthon sanctioned the deed. The execution was in accordance with the laws of all the European states of the time. It was the inherited spirit of the times, and not the power of Calvin, that burnt Servetus. The penalty was cruel; it is indefensible; it was even at the time impolitic. But Calvin is to be here blamed, only as the whole legislation of Europe is to be blamed yet more severely. Neither civil nor religious liberty was yet understood; still less was there any sharp distinction made between them. That analysis was the fruit of time, and of the seed which Calvin was then sowing in Geneva. Among his other theological works was an "Antidote," in 1548, to 25 new articles of faith, drawn up by the Sorbonne; another "Antidote," in 1547, to the decrees of the council of Trent; a severe treatise on the "Freedom and Bondage of the Will," against the Roman Catholic Pighius, which had the rare controversial success of convincing his opponent. After prolonged discussions, Zürich and Bern united with Geneva (1549) in a consensus on the Lord's Supper; the Swiss churches generally acceded to it in 1551. But the Lutherans were enraged. Westphal aroused them to opposition. When Lasco's Reformed church was driven from England on Mary's accession, it could at first find no resting place in Denmark or Germany; Westphal called them "martyrs of the devil." Calvin made a fierce attack on him and Hesshus, and rebuked with severity the silence of Melancthon. He could never understand how the Lutheran divines could make their peculiar views of consubstantiation necessary to church fellowship.—The most important part of Calvin's labors was in connection with the new academy of Geneva, inaugurated in 1559, and endowed by the liberality of Bonnivard. Such institutions of learning sprung up wherever the reform prospered. At Geneva there were chairs of Hebrew, philology, philosophy, and theology. Beza, the ardent friend and able successor as well as biographer of Calvin, of a generous humanistic culture, was the first rector of the academy. Calvin taught theology, without a title. Six hundred students were present at the opening of the institution;

the auditors of Calvin sometimes numbered more than 1,000. The wood sent here from France, says one, was manufactured into arrows. Students flocked hither from Scotland, Holland, and Germany. From 6 to 4 in summer, and from 7 to 4 in winter, the classes were together, excepting at the dinner hour, which was from 10 to 11. The place became a focus for the reformed faith. Calvinism was dispersed all over Europe. Charles IX. complained that Geneva was the nursery of heresy. "There was not a single day of his life," says Bayona, "in which John Calvin was faithless to his apostolate." His labors were ceaseless and prodigious. Every other week he preached every day, and often on the Sabbath. His sermons were extemporaneous, short and simple, always cogent, solemn, and often tender. Three times a week he lectured on theology. Every Thursday he presided in the consistory, and on Friday he was present at the congregation. His commentaries cover the larger part of the Old Testament, and all of the New excepting Hebrews and Third John, and the Apocalypse. Scaliger says: *Calvinus cepit quod in Apocasypha non scriptum.* In philological accuracy surpassed by many expositors, none have entered more thoroughly into the inmost thoughts nor brought out more distinctly the logical coherence and true spiritual sense of the sacred writers. He never yielded to the seductions of allegorical interpretation. His commentaries on the Psalms and the Pentateuch, and on Paul's epistles, and his lectures on Job, stand in the front rank of biblical interpretation. The best modern school of philology is warmest in praise of Calvin's exegetical merits. So extensive was his private correspondence, and so numerous were the inquiries addressed to him from all parts of Europe, that many a night he had no time for sleep, and many a day he had no time to "look up to the light of the blessed sun." Men in the highest stations in Europe coveted a letter from his hand. Two of his commentaries were dedicated to King Edward of England. Archbishop Cranmer advised with him as an acknowledged minister of Christ, and as the wisest counselor on the continent upon the affairs of England. A projected meeting of the reformers in England was interrupted by Edward's death. He went to Frankfurt in 1556 to compose the trouble among the English refugees. The theology and the polity with which John Knox re-constituted Scotland were confirmed in the classes of Geneva. The council of Calvin was sought by the Maravians; in Hungary he wrote letters of advice. King Sigismund, of Poland, was one of his correspondents, and he was warmly enlisted in the Unitarian controversy of that land. But his chief influence outside of Switzerland was felt in France; its churches looked to him for counsel and received his creed and polity; Coligny greeted him as the leader of the reformation, and concerted with him the first Protestant attempt at missions, that of the Huguenots at Rio Janeiro, in

1555, which was, however, broken up in 1565. The wide influence thus begun in life was perpetuated after Calvin's death. His system of doctrine and polity has shaped more minds and entered into more nations than that of any other reformer. In every land it made men strong against the attempted interference of the secular power with the rights of Christians. It gave courage to the Huguenots; it shaped the theology of the Palatinate; it prepared the Dutch for the heroic defence of their national rights; it has controlled Scotland to the present hour; it formed the Puritanism of England; it has been at the basis of the New England character; and everywhere it has led the way in practical reforms. Its theology assumed different types in the various countries into which it penetrated, while retaining its fundamental traits. In Switzerland it came to its culmination in the scholastic system of Turretin; but it breathed a freer spirit in the polemics of Stapfer. In France the school of Saumur advocated a general atonement. In the Palatinate, Calvinism was blended with the theology that Melancthon had taught at Wittenburg. In Holland, the five points were sharply presented, and Supralapsarianism partially defended; but here too the Cocceian theology of the covenants found a less abstract and a more historical basis for the system of divinity. The "Westminster Confession" combined the results of a century of controversy in an exposition, fuller than any continental symbol, and to which Scotland and the Presbyterian and Congregational churches of America have in the main adhered. But in the United States the system of Edwards has enlarged and liberalized the theology of Calvin. And in all these countries the love first of religious, and then of civil freedom, has been deeply implanted in the adherents of a theology which elevates man because it exalts God.—But with all his excellences, Calvin had also his faults and excesses. That countenance, in which, as Guizot says, was expressed "that firmness which makes no account of life, and that ardor which consumes," that severe and thoughtful visage reveals to us the man. He was severe, but more so to himself than to others. His temper was often impatient; it was hard for him, he says, to control "the wild beast." He wrote vehemently, in reply to force. He tracked the foes who were intent upon his destruction. His esthetic perceptions were dim; duty with him was the overmastering passion. He had not much time for the private affections, which are the solace of life; for life to him was a terrible combat. Yet he loved his wife tenderly; he grasped the hand of Luther with warmth, and would not let Bullinger retort his fierce attacks; Melancthon said to him, many a time, "that he wished he could only lay his weary head upon that faithful heart and die there." A man to whom Farel, Viret, Bucer, Bullinger, and, more than all, Theodore Beza looked up with such love, was no stranger

to the feeling of friendship. His theology was severe, because it was conservative and logical; it emphasized the divine holiness rather than the divine love; it made an abstract decree to take the central place, which only Christ can rightfully fill; but it is still the most complete system which the 16th century produced, nor has it been supplanted by any single work. The Roman Catholic Remond terms it "the Koran, or rather the Talmud of heresy." Bossuet, D'Alembert, Mignet, Paul Lacroix, and Nisard, all confess that it puts its author among *les grands écrivains*, and makes him one of the "glories" of French literature. Early in 1564 his body began to sink under his multiplied cares, and a complication of disorders, that had been wearing upon him ever since his youth, asthma, fever, colic, the stone, the gout, disease of the kidneys, and the hemorrhoids, assailed him with violence. He could hardly take any food, but still continued to dictate letters and comments on the book of Joshua. He began to preach a sermon on February 4, but was obliged to stop. On April 27, the lesser council met around his bedside to receive his parting words; the next day the ministers of the city and neighborhood listened, for the last time, to his affectionate and faithful counsel. Farel, now 80 years of age, journeyed from Neuchâtel once more to grasp his hand. Prayers were offered for him in all the churches. He lingered on in intense suffering, yet in the triumph of faith, until May 27, at 8 o'clock in the evening, when he breathed his last. He was buried in the cemetery of Plain Palais; at his own request, no monument marked the spot, and no one in Geneva can now tell where repose the remains of the man who made that city famous. His whole earthly wealth, 225 crowns, he bequeathed to his relatives and poor foreigners. His salary was 250 francs, and he would not receive that portion of it which accrued during his last illness.—The works of Calvin were first collected in the Geneva edition of 1617, in 12 vols. fol. The best edition is that of Amsterdam, 1671, in 9 vols. fol. The collected works of Calvin have been published in English by the Calvin translation society of Edinburgh, in 52 vols. 8vo, completed in 1855. His commentaries were published together in 1561, in 2 vols. 8vo. Tholuck edited his commentary on the New Testament, 1831-'4, Halle. The 1st Paris edition in French is now in the course of publication. His *Opuscula* were issued in 1562; the best edition is the Genevan of 1597. Parts of his correspondence appeared in 1576, in Beza's "Life of Calvin." Jules Bonnet is now (1858) editing a complete edition, after years of research; 2 volumes, containing nearly 800 letters, were issued at Paris in 1854, and, in English, at Edinburgh; 2 other volumes will complete the work. Beza, in 1564, wrote the life of Calvin. De May, in 1557, depicted his career from the Roman Catholic point of view. A publication directed against Boleac's libellous work appeared at Cleves in 1622. Waterman

and Dyer, 1850, have written his biography in English. The most complete account is given in Paul Henry's *Leben Johann Calvins, des grossen Reformators*, 3 Bde. 1835-'44, Hamburg; with a copious appendix of extracts from 644 letters, to which Dr. Henry had access. This work has been translated by Dr. Stebbing, omitting the appendix, in 2 vols. 8vo, London and New York, 1854. In Haag's *France Protestante* is a valuable *Notice sur Jean Calvin, sa vie et ses ouvrages*, with a full account of the various editions of his works. Audin's *Histoire de la vie des ouvrages et des doctrines de Calvin* (3d edition, Paris, 1845), has been translated into English and German, and is written from a Roman Catholic point of view. Among the other biographical sketches of Calvin must be mentioned one published by Herzog, in Basel, in 1843, and the famous sketch of Guizot, from which we have quoted, and which is to be found in the *Musée des protestants célèbres*. Among the more recent works which tend to throw light upon Calvin and his times, may be mentioned, Gabriel's *Histoire de l'église de Genève depuis le commencement de la réformation jusqu'en 1815* (Geneva, 1855).—For an account of the historical relations of CALVINISM, see REFORMED CHURCH.

CALVISIUS, SETHUS, a German musician and chronologist, born Feb. 21, 1566, died in Leipsic, Nov. 24, 1615. He was poor, and by his musical talents earned the means to visit several of the German universities, and made great progress in classical literature, astronomy, and the mathematics. He opened a musical school at Pforte, rather than accept a professorship of mathematics, which was offered to him by 2 universities. The reading of Scaliger's works induced him to engage in chronological calculations, and he organized a system of chronology, embracing the history of the world, upon a new plan. He also wrote upon the Gregorian calendar, proving its inadequacy, and proposing a new and more accurate system.

CALVUS, CAIUS LICINIUS MACEK, a Roman orator and poet, a son of the annalist and orator of the same name, born 82 B. C., died about 47. He left 21 orations, but few fragments survive. One of these against Vatinius, whose counsel Cicero was, produced so powerful an effect that the accused interrupted the orator and exclaimed, "Judges, am I to be condemned because my accuser is eloquent?" His poems ranked with those of Catullus.

CALX, a term formerly in use by the old chemists for designating the product of the oxidation of a metal, when heated in the air. Subsequently it was limited to lime prepared by calcination, and is now used in this sense in the pharmacopœias. Its properties will be described under the head of LIME.

CALYMENE (Gr. *καλυμμένη*, concealed, so named from the obscure nature of the genus), a genus of trilobites characterized by the faculty of rolling the body into the form of a ball, by bringing the two extremities of the

trunk together. In some rock formations they are found thus coiled up in great numbers. They are abundant both in this country and in Europe, their range being among the lower fossiliferous rocks. In some of the species the structure of the eye is beautifully preserved, showing that, in these earliest formed crustacean animals of the most remote geological periods, the same provisions were made for adapting this member to the peculiar necessities of the animal that are now seen in the complicated structure of the eye of the butterfly.

GALYPSO, a nymph of the island of Ogygia, on which Ulysses was shipwrecked. She fell in love with Ulysses and retained him for 7 years, until the gods compelled her to let him continue his journey; and the hero not having consented to reciprocate her love, although she promised him immortality if he would remain with her, she died of grief after his departure. Galypto was a daughter of Oceanus and Tethys, or of Nereus, or, according to Homer, of Atlas.

GALYX (Lat. a cup), in botany, the exterior floral envelope, consisting of a circle of leaves called sepals, which are commonly of green color. Sometimes, as in the scemone, when the corolla is wanting, the calyx has a brighter color and more delicate texture, and forms the most showy part of the flower.

CAM, Diogo, a Portuguese navigator, born in the second half of the 15th, died toward the beginning of the 16th century. He followed in the tracks of the discoveries made on the coasts of Africa under the infants Don Henrique and under Alfonso V., and passing Cape Lopo Gancabrez, and Cape Catharina, he introduced something like color into the chaos of geographical knowledge about Africa, by placing on the southern shores of the great river which is situated near these capes a *padrao*, or pile of stones, which henceforward served as boundary between the territories explored and those still unknown. He was the first to put himself into personal contact with the population of Congo, and leaving a few Portuguese sailors as hostages behind, he took some of the natives with him to Lisbon. This expedition, which took place in 1482, became of still greater service to science by the astronomical observations of the learned Martin Behaim, who accompanied it. When Cam left Congo, he stipulated with the natives to return within 15 months, and although on his arrival at Lisbon he was tempted by the brilliant reception of John II. to prolong his stay in the Portuguese capital, he returned immediately to Congo, to keep his faith with the inhabitants; and planting a second *padrao* in lat. 10° S., he penetrated as far as 22°, and on making his appearance at the court of the black king of Congo, he was not only received with every demonstration of respect, but the king sent an ambassador, Coana, with presents to Lisbon. Previous to his return to Africa, this dignitary became a convert to Christianity, the persons in his suite following his example, while the African king

manifested his willingness to Christianize his people, by asking for missionaries. The king of Benin made the same request, and Benoni, an African prince, received the rites of baptism at Lisbon.

CAMAQUÊ, or **CAMAZO**, a series of lakes in Brazil, connected with one another by natural canals. One of them is large; the others small. They are commonly named Jaguarua, Gura-pala, and Santa Martha.

CAMAMU, a town, island, and bay of the province of Bahia, Brazil. The town, situated on the Anrahi, a river which enters the bay, is a place of some trade in rice, timber, and rum. The island, in the bay, is also called *Ilha das Pedras*, or "isle of rocks."

CAMANA, a town of Peru, and capital of a province of its own name. It is situated near the mouth of the river Camana, in the department of Arequipa. Pop. of the province in 1850, 14,410; of the town, about 2,000.

CAMANQUES. See **CUMANCHE**.

CAMAPUAN, a river of Brazil, 70 miles long. It is one of the head streams of an affluents of the Paranaï, called the Tacouy or Taquari.

CAMARANCA, a river of Guinea, rises in the Kong mountains, flows 250 miles, and enters Yaury Bay, on the coast of Sierra Leone.

CAMARGO, a town of Mexico. It stands on the San Juan river, near its junction with the Rio Grande. Pop. 2,600.

CAMARGO, MARIE ANNE, a famous danseuse, born in Brussels, April 15, 1770, died in Paris, April 29, 1770. Her father, whose name was De Cuppi, was of an ancient Roman family; her mother belonged to the Spanish house of Camargo. De Cuppi made the arts of dancing and music a means of supporting his family, and brought up one of his children as a painter, another as a musician, and Marie Anne as a danseuse, in which art she was instructed by Mile. Prévost, then the great oracle of the French ballet. On appearing on the stage at the Belgian capital, she delighted the public not only by her dancing, but still more by her beauty. She made her debut at the opera in Paris in 1796, and became very popular. Finally the count de Mahon fell in love with her, carried her off, and kept her and her young sister Sophia under lock and key in his hotel. Her father petitioned Cardinal Fugery, and insisted that the count should make a countess of Marie Anne, and provide a dowry for Sophia, but he succeeded only in obtaining her release from the custody of her lover. On her reappearance on the stage she was received with the utmost enthusiasm, and, with an interval of 8 years from 1794 to 1740, she remained attached to the opera until 1751, when she retired upon a pension of 1,500 francs.

CAMARGUE, LA, the name of an island in the S. part of the department of Bouches-du-Rhône, lying between the E. and W. arms of the Rhône; area, 250 sq. m. This island, which is in the form of a delta, is alluvial, and is in part covered by marshes and lagoons, the principal being that of Valcarès. The cultivated

portion is extremely fertile; game is abundant. Salt is formed naturally on the banks of the marshes, and is an important article of trade. A company is now engaged in draining the marshes.

CAMARILLA, a term of political application, implying a secret court influence, apart from the regular and publicly known agency of ministers of state and public functionaries. It is a Spanish word, meaning primarily a small room or closet, and is used as a term of reproach. Its origin is attributed to a period after the return of Ferdinand VII., but there is considerable probability that it was known in the same sense at a much earlier stage of Spanish history.

CAMARINA, a town on the S. coast of Sicily, founded by a colony from Syracuse, about 600 B. C. It was an exposed position in the Roman and Carthaginian wars, and was several times taken, retaken, and destroyed. Scarcely any vestiges of the ancient town remain.

CAMARINES. This name is applied to the whole of the S. E. peninsula of the island of Luzon; but it designates more especially 2 of the 20 provinces of the island, known as Camarina Norte, and Camarina Sur. The name, which in Spanish signifies a small chamber, is used in Manila to signify a porch or piazza; and as the palms for the construction of this portion of the European dwellings were obtained from the peninsula, it received this name from the Spaniards. The Camarines provinces are bounded N. by the province of Tayabas; S. by the province of Albay, which forms the southern extremity of the peninsula; E. by the Pacific ocean; and W. by the great bay of Ragay. The formation of the peninsula is volcanic; the Caraballos range of mountains extends its whole length, from N. to S., and 7 of its peaks are active volcanoes. The soil of the 2 provinces possesses the same remarkable fertility which accompanies all the volcanic formations throughout the archipelago. Tobacco, sugar, coffee, cocoa, and indigo, are largely produced for exportation; but the chief occupation of the inhabitants of the Camarines is the culture of the pineapple, and the manufacture of pina cloth. The official authority, *Informe sobre Testado de las islas Filipinas*, states that about 17,000 looms are actively employed in these provinces in the manufacture of pina cloth; which varies in quality, from the most delicate fabric, worth \$1,500 for a lady's dress, to the coarser tissue, suitable for a laborer's camisa, worth \$5. The women of the Camarines are esteemed the most skilful embroiderers in Luzon of the delicate pina. The skill of the women of these provinces is also singularly displayed in the working of gold and silver filigree. All the artificers in precious metals are women; and some articles of jewelry, especially their neck chains, are very beautiful and much sought for by strangers, European as well as Asiatic.—The agriculture of the Camarines indicates in some respects a degree of progress

beyond that of the other provinces of the island. The ox, and occasionally the horse, are used in ploughing, instead of the slow, unwieldy buffalo, so generally preferred by the native East Indian farmer. The Camarinians have also discarded the ancient plough, the primitive one in use among every semi-civilized people, formed from a single piece of crooked timber, with a point hardened by fire; and have substituted in its place a European style of implement, with iron coulter and a mouldboard. As an evidence of the advanced civilization and superior skill and industry of the inhabitants of these provinces, especially of Camarina Sur, we may state that official authorities, quoting the prices of real estate in Luzon, mention a *quinton* of land, a measure of 1,000 sq. fathoms, as worth in the Camarines, when fenced and irrigated, from \$250 to \$700; or on an average \$200 per English acre. The provinces have well-constructed roads; and many of the rivers are traversed by substantial stone bridges. The Naga river, which drains the lakes Bato, Baao, Buhí, and Iryga, and disembogues into the bay of San Miguel, is navigable about 40 miles for vessels drawing not more than 13 ft. water. The industrial development of these provinces has been accompanied by a notable increase in population; and this being composed, with but small exception, of the brown race of the Philippines, which has yielded so readily to the influences of Christian civilization. The Camarines have not had their progress retarded, like other provinces of Luzon, by the troublesome presence of the wild negrito race. In 40 years, the population of the provinces has doubled. Camarina Sur, pop. 115,575, and area 2,320 sq. m. Camarina Norte, pop. 26,329, and area 1,094 sq. m.

CAMBACÈRES, JEAN JACQUES RÉGIS DE, a French statesman, born at Montpellier, Oct. 18, 1753, died in Paris, March 5, 1824. He was educated to the bar, in which profession he won an early eminence, and was made a counsellor of the court of excise in his native place. At the opening of the revolution, he took an active part in politics, and was afterward sent as member first to the legislative assembly and then to the national convention. Placed on the committee on legislation, he rendered important services by means of his intimate knowledge of law, his sagacity, and his powers of generalization. During the trial of Louis XVI., it was on his motion that counsel were allowed to the king, and were also permitted to communicate with him freely. He voted for the condemnation of that monarch, but denied the right of the convention to adjudge him to an unconditional death. He was in favor of a provisional reprieve, and of death only in case of a hostile invasion. Through the dreadful reign of violence which followed, he is said to have endeavored to restrain the more arbitrary acts of the body, and to bring it back to strictly legislative measures; but he must have exerted himself rather cautiously, for he suggested the revolutionary

tribunal, prepared many of the worst laws, and acted with Marat, Robespierre, and Barrère. On Jan. 24, 1794, he was chosen secretary to the convention, and it became his duty, in the session of March 26, to report the treason of Dumouriez. The next year he presented a plan for a civil code, which was always a favorite project with him, but the republicanism of his principles, for some reason or other, became suspected, and he was not successful; nor was he appointed to the directory, a place which he desired. He secured a seat in the council of 500, however, where he renewed his efforts in behalf of a civil code (1796), which was subsequently made the basis of the code Napoleon. After the movement of the 50th Prairial, of the year VII (June 19, 1799), he accepted the office of minister of justice under the directory; but assisted Bonaparte in the coup d'état of the 18th Brumaire, was made 2d consul, and entered upon the discharge of the duties of this office in December. He attached himself warmly to the interests of the great captain ever afterward, and remained his instrument and friend long after many others, who began with him, had deserted, and as long in fact as Napoleon had the means of rewarding his devotion. On the elevation of his leader to the imperial dignity, he became arch-chancellor of the empire, in which capacity he had to communicate all the emperor's measures to the senate, many of them not very palatable, but he did it with becoming grace. The grand orders of the legion of honor and many distinguished foreign orders fell to his lot, and in 1808 he received the title of duke of Parma. He presided over the discussions of the civil code, assisting the committee largely by his legal knowledge, his judgment, and his long previous study of the subject. During the campaign of Napoleon against the allied powers, in 1813, he was president of the council of regency; but on the approach of the allies in 1814, he repaired to Blois and from that place sent in his assent to the recall of the Bourbons. For a while afterward he lived in retirement, until Napoleon's escape from Elba, and resumption of power, placed him once more in office. He acted as minister of justice, and president of the chamber of peers. At the restoration he retired again, taking up his residence at Brussels, where he was permanently exiled, as one of those who had consented to the death of Louis XVI. In 1818, however, he was pardoned and recovered all his political and civil rights. He was an strict and able politician; popular because of his courtesy and grace and the hospitality of his entertainments; but like many other leading men of the period in which he lived, feeble in principle, and the willing instrument of the superior genius of Napoleon, in working his evil as well as his good designs. He was an accomplished jurist, but he knew also how to clothe schemes of rapacity in legal forms; and from having been an extreme Jacobin in the revolu-

tion, he became a no less extreme aristocrat, eagerly reviving all the titles and ceremonies of the ancient régime. As a diplomatist he was distinguished, and his skill helped Napoleon in more than one emergency.

CAMBAY, a seaport town at the head of the gulf of Cambay, Baroda, Hindustan; pop. about 27,000; has a trade, gradually declining, however, in cotton, grain, ivory, and articles in blood-stone and carnelian. A great part of the town is in ruins, but it contains a fine mosque, some Hindu temples, and a curious subterraneous Buddhist temple.—**THE GULF OF CAMBAY**, on the W. shore of Bombay, is 72 m. long and 82 m. wide at its entrance. It receives the waters of the Nerbudda, Dhadar, Mhye, Subbermuttee, and Bhadar rivers, and its tides are rapid and rise to a great height. The gulf is gradually becoming shallower.

CAMBAY STONES, a name given to agates, carnelians, and other stones of this nature, which are procured from Cambay, a district in India, and imported in large quantities into Great Britain. See **CALYPTAS**.

CAMBERWELL, a suburb of London, and a parish, Surrey, England; pop. in 1861, 54,867. Portions of it are densely populated, but Denmark hill, Horns hill, Dulwich, and some other parts are occupied chiefly by detached villas. It has a handsome church, several chapels of ease, a new college, &c.

CAMHIASO, Luca, called *Luca* or *Luca* na *Genova*, a Genoese artist, born in 1627, died in Madrid, in 1685. His best works are the "Martyrdom of St. George" and the "Rape of the Sabinas." Late in life, at the invitation of Philip II., he visited Madrid, and executed a fine composition, representing the "Assemblage of the Blessed," on the ceiling of the Escorial.

CAMBINI, Giuseppe, an Italian musical composer, born in Leghorn, Feb. 15, 1746, died at Blois about 1822. He composed over 60 symphonies, beside innumerable concertos, oratorios, and pieces of instrumental music. Those adapted for the violin were his most successful productions.

CAMBODIA. See **ANAM**.

CAMBODIA RIVER, or **McKENNA**, the largest of all the rivers in the Indo-Chinese territories, descends from the mountains of Yunnan, traverses the territory of Cambodia from north to south, and divides into a number of arms before reaching the sea, so as to form several large islands at its mouth. Its banks are low and sandy, and its extensive valley is annually inundated and fertilized by the overflowing of its waters.

CAMBOGIA, the synonyme in the pharmacopias of **GAMBOGIA**, or **GAMBOOK**, which see.

CAMBON, JOSEPH, a French statesman, born June 17, 1754, at Montpellier, died in Brussels, Feb. 15, 1820. Engaged in commercial pursuits, he became interested in the revolution, and on hearing of the flight of Louis XVI. he caused the republican government to be pro-

claimed in his native town. He was sent to the legislative assembly, and while supporting the cause of democracy, gave particular attention to financial matters. Most of the great measures which enabled the government to get through the revolutionary period were suggested or controlled by him; and to him the honor is due of having laid the foundation of the modern financial system of France. He promoted the confiscation of the estates of the *émigrés* in 1792, and made, after August 10, a report in which he argued that Louis XVI., having held a secret correspondence with the enemies of France, was guilty of high treason. He presided over the last sittings of the legislative assembly, and afterward took his seat as a member of the convention. Here he opposed with equal energy the partisans of monarchy and of terrorism. He accused both Dumouriez and Marat. When Louis XVI. was arraigned before the convention, he voted for his immediate death, and against the appeal to the people. He opposed the creation of the revolutionary tribunal, and insisted upon trial by jury. At the opening of the convention, he had been appointed member of the committee on finances; April 7, 1793, he entered the committee of public safety. On June 2, when the Girondists were threatened by the infuriated mob calling for their proscription, he boldly took his place among them, hoping to be able, through his popularity, to save them from violence; he then opposed to the last the decree ordering their arrest, and he seemed so much grieved by its adoption, that it was thought for a moment that he would not reappear in the assembly. He did not, however, desert his post, and continued to fulfil his duties with untiring activity. In July, 1793, he presented, in the name of the committee on public safety, the report on the general situation of affairs. The next year he made another report on the administration of finances, which is considered a masterpiece of financial ability, and gives a full sketch of the plan which was afterward adopted for the regular registration of public debt. In the conflict which brought on the revolution of the 9th Thermidor, Cambon took part against Robespierre and his adherents; but though he had been instrumental in their defeat, he was charged with having been their accomplice, and a warrant was issued against him. He succeeded in baffling the search for him, and on the amnesty proclaimed by the convention on their adjournment, he retired to an estate in the vicinity of Montpellier, where he devoted himself to agriculture. In 1815 he was elected a member of the chamber of deputies. On the second return of the Bourbons, he was not included in the bill of amnesty, and repaired to Brussels, where he spent his last years in retirement.

CAMBOORIE, or **KAMBURI**, a walled town of Siam, at the confluence of the See-sawat and May-mannoi rivers. It has a brick fort with 20 guns.

CAMBORNE, an English town in the county of Cornwall, $9\frac{1}{4}$ miles N. W. from Penryn; area, 6,900 acres; pop. nearly 8,000. It is a neatly built modern town, and derives its importance mainly from its vicinity to very productive tin and copper mines. It has a handsome church, built in the later Gothic style, several dissenting chapels, and a free school.

CAMBRAI, or **CAMBRAY**, a fortified town of France, department of Nord, on the right bank of the Scheldt, at the head of the canal of St. Quentin, 105 m. N. N. E. from Paris. It was a place of importance when Cæsar conquered the country, and from its old name, Camaracum, its present appellation was derived. It was for a while the seat of a small Frankish kingdom, which was united by Clovis to his empire. During the middle ages it belonged to the counts of Flanders, and came afterward into the possession of the dukes of Burgundy, from whom it was transmitted to the house of Austria. Here the famous league against Venice was concluded in 1508, and a peace between Francis I. and Charles V. was negotiated in 1529 by Louise of Savoy and Margaret of Austria, known as *la paix des dames*. It was taken from the Spaniards by Louis XIV., in 1667, and confirmed to France by the treaty of Nimeguen. Fénelon was archbishop of Cambrai, and during the disastrous war for the succession of Spain devoted himself to the protection of the people of his diocese. In 1793 the town was vainly besieged by the Austrians. It was the birthplace of Dumouriez and Marshal Mortier. It has been long celebrated for its manufacture of fine linens and lawns, whence all similar fabrics are called in England cambrics, and which are still the most important branch of its industry. It also produces thread, cotton stuffs of various kinds, soap, and beet sugar. The principal public buildings are the cathedral, which is modern, the old one having been destroyed during the revolution, the city hall, and the theatre. A monument was erected here in honor of Fénelon. Cambrai has a communal college, a diocesan seminary, a library with 80,000 volumes, and several other learned and charitable institutions. Pop. in 1856, 21,406.

CAMBRIA, the Latin name for Wales, meaning the land of the Cymri, as the Welsh call themselves in their native tongue.

CAMBRIAN SYSTEM, the lowest classified group of fossiliferous rocks, lying next below the silurian. The Potsdam sandstone of this country is included in it by Lyell, and the sandstones and conglomerates of Lake Superior are referred by Logan to the same group, or possibly to one still older.

CAMBRIC, originally a very fine fabric of linen, named from Cambrai, where it was first made. The name afterward came to be applied to cotton fabrics of various qualities.

CAMBRIDGE, a city of Middlesex co., Mass., a suburb of Boston, lying W. of that city, and separated from it by the river Charles, which is nearly a mile in width. It was settled in 1631,

at first under the name of Newtown, by Gov. Winthrop, Deputy Gov. Dudley, and other prominent men, who designed to make it the chief town in Massachusetts colony. The annual election for governor was for several years held under an oak tree on the common. The Rev. Mr. Hooker and the Rev. Mr. Stone, graduates of Cambridge college, England, were the first settled ministers of the place, both of whom subsequently accompanied the Connecticut settlers in their journey through the wilderness, and founded Hartford. Mr. Hooker was settled in 1632, and soon had for parishioners the learned men of the colony, most of whom had graduated at Cambridge. In 1636 the general court appropriated £400 for the establishment of a public school at Newtown, which in 1638 was further endowed by the Rev. John Harvard, minister of Charlestown. In honor of the place where the chief men of the colony had received their education, the name of the town was changed to Cambridge, and the school was styled Harvard college. It is the oldest and most richly endowed institution for public instruction in America. The college buildings occupy about 14 acres of ground, which is laid out with much taste and care, and with its fine shade trees presents a charming appearance. (See *HARVARD COLLEGE*.)

—Cambridge was incorporated as a city in 1846, and is divided into 3 distinct portions, more or less compactly settled: Old Cambridge, the seat of the college and the residence of literary, scientific, and wealthy men; Cambridgeport, and East Cambridge, the business portions of the city. Two bridges connect it with Boston, and one with Charlestown. The Boston and Lowell railroad and the Fitchburg railroad pass through East Cambridge. A horse railroad with several branches, and several omnibus lines, furnish accommodations for travel to Boston. The city is pretty regularly laid out in broad streets and avenues, and has many fine public buildings and private residences. Some of the college buildings are ancient, others of modern construction, elegant and ornate, and admirably adapted for the purposes designed. Many of the private residences are surrounded with highly cultivated grounds, lawns, flower gardens, and orchards. Many structures erected before the revolution are still standing, among others the house used by Washington for his headquarters, now inhabited by Mr. Longfellow. The streets and college grounds are adorned with noble trees; conspicuous among them the Washington elm, beneath which the commander-in-chief assumed the command of the American army in 1775. The tree is probably of the native forest growth, and is still vigorous. The public schools are of a high order—primary, grammar, and high schools; in the last-named the languages preparatory to a collegiate course are taught. At Cambridgeport and East Cambridge a large amount of business is transacted. There are 5 banks, with a capital of \$380,000; also 2 savings

banks, with deposits amounting to \$360,000. East Cambridge was formerly known as Lechmere's Point. Here the courts house and jail are situated; also, the extensive glass works of the N. E. glass co., in whose premises it is to be seen the tallest chimney in New England, 240 feet in height. A great variety of manufactures are carried on. The value of articles produced in 1855 was about \$11,000,000; 60,000 tons of ice, valued at \$30,000, are exported from Fresh pond per annum; 8,164,000 lbs. of soap, valued at about \$600,000; 424,000 lbs. of tallow candles, valued at \$100,000; \$200,000 worth of brushes were manufactured in 1855; also, large values of bricks, tinware, confectionery, fireworks, wood-turning, and cabinet work. Many of the inhabitants find employment in Boston. The university printing office is the oldest printing establishment in America. It was started in 1639 by a Mr. Glover, who gave it to the college. A gentleman at Amsterdam gave the first font of type, 49 lbs. weight. The first thing printed was the "Froeman's Oath;" the next, an almanac for New England, calculated by William Pierce, a mariner; the next, a metrical version of the Psalms. The office is now noted for its superior style of typographical execution.—The cemetery of Mount Auburn is situated in Cambridge and Watertown. It includes about 100 acres of land, covered with a vigorous growth of forest trees. The tract is undulating, with bold eminences and beautiful dells. The highest eminence is 125 feet above the tide in the river Charles, which winds along at a short distance from its base. A round tower of hammered granite, with a lookout 70 feet from the ground, has been erected upon its summit. The grounds are laid out with curved avenues adapted to the inequalities of the surface. The walks are smoothly gravelled and bordered with ornamental shrubs and flowers. The burial lots contain about 300 sq. feet each, and on many of them are monuments of rare workmanship and elaborate design. The entrance is through a gateway of granite, in the Egyptian style of architecture. Among the monuments is one to Spurzheim, the phrenologist, erected through the munificence of citizens of Boston. It is of Italian marble, and after the design of Scipio's tomb at Rome. The cemetery was dedicated in 1831. The observatory connected with the university is on an eminence nearly a mile W. of the college grounds. The population of the town in 1790 was 2,115; 1800, 2,453; 1810, 2,323; 1820, 3,205; 1830, 6,072; 1840, 8,400; 1850, 15,215; 1855, 20,473.

CAMBRIDGE, the county town of Cambridgeshire, in England, 57½ miles from London by rail; pop. in 1851, 27,815. The town is in the centre of an agricultural district, and is remarkable for its excellent market. The buildings consist of the guildhall, a handsome modern structure, several churches, including St. Sepulchre, a round church, built in imitation of the church of the Holy Sepulchre at Jerusa-

lem, and consecrated in 1101, Addenbrooke's hospital, and several other handsome edifices. A school of art was established here in Aug. 1858. The town is on the river Cam, the ancient Granta, and was the site of a Roman station. King John gave Cambridge a guild, and the privilege of being governed by a provost of its own choosing, an office for which Henry III. substituted a mayor and 4 bailiffs. Cromwell thrice represented Cambridge in parliament. The borough of Cambridge is governed by 10 aldermen and 80 councillors, one of whom is mayor, and returns 2 members to the house of commons. There are places of worship for Wesleyans and Primitive Methodists, for Baptists and Independents, a grammar-school founded in 1615 for 100 scholars, and various charitable, educational, and literary institutions, among which there is an industrial school, a mechanics' institute, and the Philo union. Cambridge derives its chief glory from being the seat of the celebrated university of that name.

CAMBRIDGE, UNIVERSITY OF, an English seat of learning, of very ancient origin. The first authentic charter is said to be dated 15th Henry III. (1230), and even long before that time Cambridge is believed to have enjoyed a reputation for learning. The present university statutes were given by Elizabeth in the 12th year of her reign. They are the foundation on which all new laws are framed. The university consists of the following 17 colleges: St. Peter's, founded 1257; Clare Hall, 1326; Pembroke, 1347; Gonville and Caius, 1348; Trinity Hall, 1350; Corpus Christi, 1352; King's, 1441; Queen's, 1448, re-founded 1465; St. Catharine's Hall, 1476; Jesus, 1496; Christ's, 1505; St. John's, 1511; Magdalene, 1519; Trinity, the wealthiest college of them all, 1546; Emmanuel, 1584; Sidney Sussex, 1598; Downing, 1800. Each college is a corporate body, bound by its own statutes, but is likewise subject to the general laws of the university. Each of the 17 colleges furnishes members both for the legislative and executive branches of the government of the university. The former branch consists of a senate, which is divided into 2 houses—the regents' and the non-regents' house—and of the council of the senate, by which every university grace must be sanctioned before it can be brought before the senate. No degree is ever conferred without a grace for that purpose. The council consists of the chancellor, the vice-chancellors, 4 heads of colleges, 4 professors of the university, and 8 other members of the senate. The executive officers of the university are: a chancellor, a high steward, a vice-chancellor, a commissary, a public orator, the assessor, 2 proctors, a librarian, a registrar, 2 scrutators, 2 moderators, 2 pro-proctors, and various other officers. The university sends 2 members to the house of commons, which are chosen by the collective body of the senate. The present members (elected April, 1857) are Mr. L. T. Wigram and the Rt.

Hon. Spencer H. Walpole. The number of members of the university senate for 1858 is 4,656; of under-graduates or students, 1,518; and the total number of members inscribed on the books or boards of the university, 7,516. The branches of study pursued at Cambridge may be inferred from the following list of professors, namely: the Lady Margaret's professor of divinity; the regius professors of divinity, civil law, physic, Hebrew and Greek; 2 professors of Arabic, one of whom is appointed by the lord almoner; the Lucasian professor of mathematics; professors of moral theology or casuistry; chemistry, astronomy, and experimental philosophy; anatomy; modern history; botany; geology; astronomy and geometry; the Norrisian professor of divinity; natural and experimental philosophy; the Downing professors of the laws of England and of medicine; the professors of mineralogy, political economy, and music; and the Disney professors of archaeology, founded in 1851 by Mr. John Disney. Beside these regular professorships, there are various endowed lectureships. A board of mathematical studies was established in 1848; a board of classical studies in 1854; and a board of medical studies in the same year. The revenues of the separate colleges are large and are derived from endowments and fees, but those of the university are small, and hardly exceed £5,500 a year. The professors are paid from the university funds, or by the government, or from estates left for that purpose. The sum granted to them by the government was £1,053 in 1856 and the same amount in 1857. The caution money to be deposited preliminary to the admission to the university is £50 for noblemen, £25 for fellow-commoners, £15 for pensioners, and £10 for sizaras. The matriculation fees are respectively £16, £11, £5 10s., and £1 5s. There are various degrees of payment for tuition, according to the degree and condition of the members, and slightly differing in the several colleges. The annual unavoidable average expenses of an under-graduate or student, are stated by the "Cambridge Almanac" of 1858 to be about £60, or \$300. The terms of the university are 8, viz.: Michaelmas, or October, begins Oct. 10, and ends Dec. 16; Lent, or January, begins January 13, and ends on the Friday before Palm-Sunday; Easter, or midsummer, begins on the 11th day (the Wednesday se'nnight) after Easter day, and ends on the Friday after commencement day. Commencement day is always the 1st Tuesday in July.—The degrees are conferred as follows: Bachelor of arts (B. A.) after 12 terms, 10 of which must be in residence. Privy councillors, relations of royalty, bishops, noblemen and their sons, baronets, and knights, are admissible after 7 terms. Master of arts (M. A.), 8 years after taking a bachelor's degree; bachelor in divinity (B. D.), must be M. A. of 7 years' standing. Persons admitted of any college when upward of 24 years old, are permitted to take the degree of

B. D. after 10 years (of which the last 3 years must be in residence) without having previously received any other degree, and are called "ten-year-men;" doctor in divinity (D. D.), must be B. D. of 5, or M. A. of 12 years' standing; bachelor in the civil law (B. C. L.), must be of 6 years' standing complete, and must reside the greater part of 4 several terms; doctor in the civil law and doctor in physic (D. C. L. and M. D.), must both be B. C. L. of 5, or M. A. of 7 years' standing; bachelor in physic must be M. A. or M. B. of some terms' standing after having been admitted M. B.; bachelor in music (Mus. B.), must enter his name in some college and compose and perform an exercise in his art; doctor in music (Mus. D.), generally a Mus. B., and his exercise is the same. The examinations take place in the Lent term in each year, are conducted by the moderators and by examiners appointed by the senate; and the course of study preparatory to the degree of B. A. comprises the principal branches of learning. The 1st university or "previous" examination (technically called the "little go"), takes place in the Lent term of the 2d year from that in which the student commences his academical residence, the subjects of examination being 1 of the 4 Gospels, or the Acts of the Apostles, in the original Greek, "Paley's Evidences of Christianity," and one of the Greek and of the Latin classics. The examination of bachelors of arts extends over 22 days; that of candidates for mathematical honours, technically called the mathematical tripos, lasts 5, and that in classical learning or classical tripos, 5 days. Examinations in moral and natural sciences (moral sciences and natural sciences tripos), have likewise been in operation, since 1857. At the close of the examination, a select number, 80 at least, are recommended to the approbation of the proctors, and their names are classed in 3 divisions, viz.: wrangler, senior optimate, and junior optimate, the highest of all being the senior wrangler for the year. The candidates are then admitted to their degrees by the vice-chancellor, after they have taken the oath of allegiance and supremacy, and of observing the statutes of the university, and having also declared that they are *bona fide* members of the church of England. A great number of exhibitions and scholarships are among the rewards which meritorious students receive from *alma mater*. Since the days of Newton, one of the great lights of Cambridge, this university has been considered more particularly the chosen seat of mathematical science, but the tendency to make it a stronghold of learning in all the various branches of science, has been increasing of late years, and questions have been lately raised as to the mode of education, both at Cambridge and Oxford, and the subject has been a matter of lively discussion in parliament. Among the eminent men who have studied at Cambridge, beside Bacon and Newton, are Coke, Donne, Barrow, Dryden, Middleton, and Lord Byron. Among the famous teachers were Archbishop

Whitgift, Bishop Wilkins, Isaac Barrow, and Richard Bentley. Many of the principal buildings and offices of the various colleges are of remarkable beauty and splendor, and above all, the Gothic chapel of King's college. The public buildings of the university consist of the senate-house, the university library, the schools, the university or Pitt press, the observatory, the botanical garden, the astronomical, geological, and mineralogical museums, and the celebrated Fitzwilliam museum, for the establishment of which Lord Fitzwilliam bequeathed to the university the annual interest of £100,000 South sea annuities, and which contains a collection of books, paintings, and engravings. The university library has greatly increased, mainly through the munificence of George I. and II., and the number of printed volumes is now (1856) about 200,000. There are also about 2,000 manuscripts, which contain many remarkable works. The library of Trinity college contains nearly 43,000 volumes, including MSS. in the handwriting of Milton, Newton's copy of his *Principia*, Dr. Gale's Arabic manuscripts; it has received a recent addition of 4,500 volumes by a bequest of Archdeacon Hare, which is especially rich in German literature. The library of Corpus Christi college, St. John's college library, and the Pepysian library (so called after Samuel Pepys), also contain many ancient manuscripts and curious books. Beside the various resources of learning in the colleges, libraries, &c., there are 3 learned associations, viz.: a philosophical, an antiquarian, and an architectural society.

CAMBRIDGE, AMERUS FREDERIC, duke of, born Feb. 25, 1774, in London, died July 6, 1850. He was the youngest son of George III., and the uncle of Queen Victoria. He entered the British army as ensign when 16 years of age, and completed his education at the German university of Göttingen. He returned to England in 1795. He leaned at first to the side of the opposition on the question of the French war, but afterward sided with the government. He took part in the campaign in the Netherlands (1793), and fell into the hands of the French at the battle of Hondschoote, but was soon afterward exchanged. In 1801-3 he was employed in Hanover, vainly endeavoring to preserve it from occupation by foreign powers. In 1810 he was again sent to Hanover by the British prince regent, in the capacity of governor-general, and in 1831 was appointed viceroy of Hanover. In 1837, on the separation of Hanover from the British crown, he returned to England again. From that period until his death he was best known to the public as the president of charitable societies, and the chairman at the anniversary dinners of public associations.—CAMBRIDGE, GEORGE WILLIAM FREDERIC CHARLES, duke of, a British general, son of the preceding, and cousin of Queen Victoria, born in Hanover, March 24, 1819. He became colonel in the army in 1837, and major-general in 1845. In 1850 he succeeded his father as

duke of Cambridge, in 1854 was advanced to the rank of lieutenant-general, and in 1856 to that of general. He commanded the 2 brigades of Highlanders and guards which formed the first division of the army sent to the Crimea. He led these troops into action at the battle of Alma, and at Inkerman had a horse shot under him. Directed by his physician to withdraw for a time from camp life, he retired first to Pera, and soon after to England. On the resignation of Viscount Hardinge in July, 1856, he was appointed commander-in-chief of the British army.

CAMBRIDGESHIRE, one of the agricultural counties of England; area, 893 sq. m.; pop. in 1851, 185,405. The general aspect of the county is flat; in fact, it has been redeemed for agricultural purposes, and forms part of the great Bedford level. The rivers are the Ouse, the Nen, the Lark, and the Cam, all small, but rendered useful for inland navigation. The county is traversed by several railways and main roads, but the internal traffic is inconsiderable. The history of Cambridgeshire is interesting in the early times for the resistance offered by the Saxons in the isle of Ely to the Normans. They succeeded for a considerable time in maintaining their independence, notwithstanding the force which William in person brought against them. In the civil wars Cambridgeshire was generally favorable to the parliament, while the university supported the cause of the king.

CAMBRONNE, PIERRE JACQUES ÉTIENNE, baron, a French general, born Dec. 26, 1770, at St. Sébastien, near Nantes, died in the latter city, Jan. 8, 1842. He served in the Vendée under Hoche, then in Switzerland under Masséna, entered the imperial guard, and was renowned for intrepidity. When the emperor was sent to Elba, Cambronne went with him, and during the Hundred Days he received the rank of lieutenant-general, and a seat in the senate. At Waterloo he was in command of the imperial guard; and when the day was lost, being surrounded by his enemies and summoned to surrender, he refused, and fell covered with wounds. He was taken from among the dead, nearly dead himself, carried to Brussels, and afterward to London; but having been charged in France as guilty of an attack on his own country, he gave himself up as a prisoner and demanded a trial. He was tried and honorably discharged. After the revolution of July, 1830, although almost disabled by age and wounds, he was reinstated among the staff officers of the army.

CAMBYSES, the second Persian king, succeeded his father Cyrus 529 B. C., died 522 B. C. He is the Ahasuerus of Scripture, who is mentioned (Ezra iv. 6-22) as prohibiting the Jews from rebuilding their temple. In 525 B. C. he conquered Egypt, and took Psammenitus, its king, captive. He then desired to attack Carthage; but the Phœnician fleet, which formed the bulk of his navy, refused to molest

their own colony. An army sent to take possession of the temple of Jupiter Ammon perished in the sand, and another army, led by Cambyses himself against the Ethiopians, was reduced by hunger and disease. These disasters exasperated Cambyses. He put his brother Smerdis to death, killed one of his sisters, who was (contrary to Persian law) also his wife, because she mourned for Smerdis, and treated the Egyptians with great cruelty. He gave orders for the destruction of many Egyptian sacred monuments, and slew the god Apia. He decreed the death of Croesus, the ex-monarch of Lydia, attended at the place of execution, and burst into tears. The officers suspended their operations. Cambyses advanced and embraced Croesus, but ordered the instant execution of the officers for disobedience. These and other eccentricities caused an insurrection among his officers, who espoused the cause of a pretended Smerdis. Cambyses set out against the pretender, but died from a wound accidentally inflicted by his own sword.

CAMDEN, the name of counties in several of the United States. I. A south-western county of New Jersey, separated from Pennsylvania by the Delaware river, and comprising an area of about 220 sq. m. The surface is generally level, the soil of the E. part sandy, and that of the W. a rich loam, yielding quantities of fruit and vegetables for the Philadelphia markets. The productions in 1850 were 259,684 bushels of Indian corn, 307,869 of Irish potatoes, 65,191 of sweet potatoes, 12,946 tons of hay, and 299,856 lbs. of wool. There were 2 founderies, 1 locomotive manufactory, 5 glass works, 11 flour mills, 1 paper mill, and 28 saw mills, 35 churches, 3 newspaper offices, and 3,689 pupils attending public schools. Most of the manufacturing establishments are in the E. part of the county. The Camden and Amboy and Camden and Atlantic railroads traverse it. Formed from Gloucester co. in 1844. Capital, Camden. Pop. in 1855, 29,160. II. A north-eastern county of North Carolina, bounded N. by Virginia, S. and S. W. by Albemarle sound and Pasquotank river, and having an area of about 280 sq. m., part of which is occupied by the Dismal Swamp. It has a level surface and a fertile soil, well adapted to Indian corn, of which in 1850 it produced 863,000 bushels, beside 28,492 of sweet potatoes, and 4,880 of wheat. There were 5 shingle mills, 1 corn and flour mill, 7 churches, and 1,350 pupils attending public schools. Valuable forests of cedar and cypress exist, and the exportation of the lumber and other products is facilitated by the Dismal Swamp canal, 22 miles long. Value of land in 1857, \$573,738. Capital, Camden Court House. Formed in 1777, and named in honor of the earl of Camden, who defended the American colonies in the British parliament. Pop. in 1850, 6,049, of whom 2,187 were slaves. III. A south-eastern county of Georgia, bordering on Florida and the Atlantic ocean, bounded S. by St. Mary's river, intersected by the Santilla,

and having an area of 1,125 sq. m. It includes Cumberland island in the Atlantic, 18 miles long, 2 or 3 miles wide, and separated from the mainland by a narrow channel. The surface is level and the soil sandy. The productions in 1850 were 6,400,940 lbs. of rice (the greatest quantity produced by any county of the state except Ohatham), 52,328 bushels of sweet potatoes, 63,478 of Indian corn, and 45 hogsheads of sugar. There were 3 turpentine distilleries, 4 corn mills, 1 saw mill, 10 churches, and 115 pupils attending schools and academies. Value of real estate in 1856, \$878,592. Capital, Jefferson. Pop. in 1855, not returned; in 1850, 6,319, of whom 4,246 were slaves. IV. A central county of Missouri, drained by Osage and several other rivers, and having an area of about 600 sq. m., with an undulating surface and a tolerably fertile soil. Lead mines are worked near Osage river, which is navigable during a short time every year. The productions in 1850 were 256,054 bushels of Indian corn, 22,241 of wheat, 45,176 of oats, and 219 tons of hay. There were 5 corn mills and 6 saw mills. Capital, Erie. Pop. in 1856, 3,287, of whom 188 were slaves.

CAMDEN. I. A city, port of delivery, and seat of justice, of Camden co., N. J.; pop. in 1850, 9,479; in 1855, about 15,000. It is built on a plain on the left bank of Delaware river, immediately opposite the city of Philadelphia, with which it is connected by 5 ferries, and its proximity to which has greatly aided the growth of its population. The streets are regular, and intersect one another at right angles. There are many fine buildings; the principal public edifices are a court house and gaol, 2 railway depots, and 10 churches. There are 2 literary associations, an insurance company, iron founderies, ship yards, chemical and glass works, and a number of mills of various kinds. The city was chartered in 1831, and is divided into 8 wards, governed by a mayor and common council. Railroads connect it with New York, Trenton, Woodbury, and Absecon Beach. II. The capital of Kershaw district, S. C., 112 m. from Charleston, is situated in a fertile and productive region, on the E. bank of the Wateree river, which is navigable to this point by steamboats, and is crossed by a bridge near the town; pop. 2,000. Camden is a flourishing commercial place, cotton and turpentine being the staples of export; it communicates by railroad with Charleston. It contains 8 academies and several grammar-schools, 2 banks, 4 churches, an orphan society, a masonic lodge, and various other societies. It has witnessed 2 battles—one fought in Aug., 1780, between Gates and Cornwallis; the other in April, 1781, between Greene and Rawdon. A monument to Baron De Kalb was erected in 1825, of which Lafayette laid the corner stone. Two Indian mounds exist on the side of the town. III. The capital of Wilcox co., Ala., pop. 800, is a flourishing post village, the centre of an active trade, and the most populous town in the county. It stands on a healthy

eminence about 4 m. from Alabama river, and contains a respectable academy and 2 female seminaries. On several maps of the state it has been erroneously named Barboursville. IV. The capital of Washita co., Ark.; pop. in 1855, 1,400. It stands on a declivity of a range of hills, on the right bank of the Washita river, and at the head of navigation for large steamers. It is a handsome place, built in a very tasteful style, and possessing great advantages for trade. A plank road, to connect it with Fulton on Red river, is now in process of erection. It was formerly a rendezvous for hunters, known as *Ecore à Fabre*. It was settled in 1842, on the site of a dense forest, parts of which are still standing. The growth of the town has been very rapid, and it still continues to increase in size, population, and importance.

CAMDEN, a south-eastern county of New South Wales, bordering on the Pacific, and covering an area of 1,400,320 acres. It has an uneven surface, beautifully diversified by hills, valleys, and picturesque lakes. It is well watered by small branches of the Cowpasture, Wingecarabee, Shoalhaven, and other rivers, has many fertile tracts, and embraces a variety of fine scenery. One of the richest parts of the county is a district known as the "Cowpastures," so called from large herds of cattle found there, which sprang from a few animals escaped from the settlements soon after the foundation of the colony. Capital, Berrima. Pop. 8,323.

CAMDEN, CHARLES PRATT, earl, an English judge and statesman, born in Devonshire, in 1714, died April 13, 1794. He was educated at Eton and Cambridge; was called to the bar in 1738, where after passing a long period without practice, his rise was at length sudden and rapid. In 1752, upon the prosecution of a printer for a libel upon the house of commons, Pratt maintained, in opposition to the ruling of the judge, the doctrine of the right of juries to decide upon the nature and intention of alleged libels. His position upon this occasion was the commencement of a contest which continued for 40 years, and it is mainly owing to his exertions that this doctrine finally became recognized as the law of England. In 1757 he was made attorney-general and knighted under Lord Chatham. In his place in parliament he conducted the law business of the crown satisfactorily but without display, and as the prosecuting officer he took the opportunity to proceed, before juries, upon his former construction of the law of libel. He also conducted with great propriety and moderation the trial of Lord Ferriers for murder before the house of lords. In consequence of the change of policy which took place on the accession of George III., Pratt was removed in 1762 to the chief justiceship of the court of common pleas, and accepted the appointment as a lasting retirement from public life. But the arrest of Mr. Wilkes, April 30, 1763, under a general warrant from the secretary of state and other similar cases, brought

the important political and legal questions concerning the legality of such warrants before that court, and in his judgments against them he was called upon to take a position in defence of the liberties of the subject. The principles which he then laid down were not only applied to check abuses at the time, but have ever since been considered of the first importance. In consequence of the great popularity thus obtained, he was raised to the peerage, July 17, 1765, under the name of Baron Camden. He distinguished himself at once by his exertions in behalf of the American colonies, and on the formation of Lord Chatham's 2d administration he was made lord chancellor, July 30, 1766. He held this office for 8½ years, discharging his duties as a judge with universal approbation, but occupying, as a minister, a precarious and doubtful position in relation to the American policy of the cabinet. However, upon the resignation of Lord Chatham he hastened to free himself from complicity with their measures, and was removed from his place Jan. 17, 1770. From this time until the close of the American war he continued in opposition to the government of Lord North, both upon its domestic and foreign policy, the treatment of Wilkes and of the colonies; and distinguished himself by the memorable eloquence with which he contended in parliament for the just demands of the Americans and the pacification of the empire. Soon after the trial of Woodfall, the printer of Junius's letters, in 1770, before Lord Mansfield, he was engaged in a personal controversy with the latter, in relation to the charge to the jury upon that occasion, upon the old question of the law of libel, in which he obtained a decided superiority. After the resignation of Lord North's ministry in 1782, he was made president of the council, but resigned the next year on the accession of the "Coalition Ministry," and enlisted under the banner of the younger Pitt. The success of this minister led to Camden's restoration to the same office which he peacefully filled for 9 years. He was created Earl Camden and Viscount Bayham of Bayham abbey, Sussex co., May 13, 1786; and still took a considerable share in the business of the house of lords, notwithstanding his advanced age. In 1792, a short time before his death, he had the satisfaction of pressing the passage of Mr. Fox's declaratory libel bill through the house of lords, against all the ingenuity of Lord Thurlow, who had procured a unanimous opinion of the 12 judges against it. He had contended for its principles throughout his life, and its final success was mainly attributable to his courage and vigor.

CAMDEN, WILLIAM, a British historian and antiquary, born in London, May 2, 1551, died at Chiselhurst, in Kent, Nov. 9, 1628. In 1571 he quitted the university of Oxford, having previously been educated at Christ's hospital and St. Paul's school, and prosecuting his studies in London, he was appointed in 1576 second master of Westminster school. During this pe-

riod he composed his celebrated work, written in elegant Latin, entitled *Britannia*, which was published in 1586. An English translation, by Dr. Holland, appeared in 1610, and a later edition in 1637, and new translations by Edmund Gibson, afterward bishop of London, in 1695, and afterward by Mr. Gough, the eminent topographer. In these editions large additions and changes were introduced, so that the work in its English dress little resembles the original. In 1592 he became head master of Westminster school, and in 1597 was made Clarencieux king at arms. His next great work was the "Annals of the Reign of Queen Elizabeth," also written in Latin; the first part of this was published in 1615, and though it was completed within the next 2 years, he determined that the 2d volume should not appear until after his death. He commenced a history of the reign of James I., which he did not live to complete. He wrote many other works, among which was a Greek grammar published in 1597, and used at Westminster school. He was interred in Westminster abbey, where a monument with his half-length statue, the left hand resting on "*Britannia*," still remains. The Camden professorship of history at Oxford derives its name from Mr. Camden, who devoted the greater part of his estate to its foundation.

CAMEL (*camelus*), a genus of ruminant animals, without horns. The name of this animal is nearly the same in the languages of all civilized nations, from the Hebrew, Arabic, and Greek, down to the modern tongues spoken at the present day. It appears to have been nearly, if not absolutely, the first animal that was reduced to the service of man, or it divides that claim with the only other creature which can compare with it in patient endurance of fatigue and privation, the much slandered and cruelly abused ass; both having long preceded the horse in their services to the human race. Unlike the ass, however, which still exists in a wild state in the central regions of Asia, so far south as to the northern limits of India, the camel cannot be assigned to any land, locality, or climate, in which it has ever, certainly, existed in a wild condition. Diodorus and Strabo, indeed, mention it as being found wild in the interior of Arabia; while Desmoulins, who has left some valuable contributions on this subject, asserts that it so existed as lately as in the time of Hadrian. It is said also, by the natives of Central Africa, that camels are there to be found wild, in regions never trod by a European foot; while statements of the same kind are current among the Tartars and Bucharians in relation to Central Asia. In all these cases, however, there is much reason to believe that where they do exist in a state of nature at this time, or did so exist formerly, they are, like the wild horses of America, descendants of animals which, once domesticated, have been accidentally or purposely liberated by their owners; and in some cases the Osmucks are known to be still in the habit of liberating domestic

animals of all kinds, from religious scruples. The countries over which the camel is now the most widely distributed, are Arabia, Persia, the south of Tartary, some parts of India, Africa from Egypt to Mauritania, and from the Mediterranean to the river Senegal. It is numerous in the Canary islands, but is found in Europe only in the vicinity of Pisa, in Italy, where the arid plains and stunted bushes of San Rossore bear some resemblance to the desert regions of Africa. It is doubtful at what period, or by whom, the camel was first introduced into Tuscany; but there is no doubt that in that country it is in rapid progress of deterioration. Within the last few years, the camel has been introduced into the southern parts of the United States of America, as a government experiment, for its employment in strategical purposes, and for the conveyance of supplies, munitions of war, provisions, and stores, to the isolated garrisons beyond that dreary tract known as the great salt desert, and the other barren plains, producing no forage but stunted artemisias and other arid and bitter herbs, on which horses and oxen cannot be supported, and less than sparingly supplied with water. They are understood to be at present in process of acclimatization; in Texas, where they have lately been subjected to the severest tests, by long marches, heavily loaded, and depending on the scanty forage and water found by the way, during the surveys in progress in that arid region; and the result is reported as satisfactory even beyond expectation.—That the camel was domesticated from the earliest times, is put beyond doubt by the continual mention made of him in the very earliest books of Holy Writ; as it is related of Abram, when he went down into Egypt to sojourn there during the famine, that among the wealth he there acquired were "sheep, and oxen, and he-asses, and man-servants, and maid-servants, and she-asses, and camels;" whereas horses are not named until 3 generations later, when in the time of the stewardship of Joseph, among the valuables which he received in exchange for corn, horses are, for the first time in history, enumerated. The use to which the camel was applied, even at that early period, for purposes of commercial intercommunication and desert travel, is clearly shown in the story of Joseph himself, long before the days of his advancement, whose brothers, after they had cast him into a pit that was in the wilderness, "lifted up their eyes, and looked, and behold, a company of Ishmaelites came from Gilead with their camels, bearing spicery, and balm, and myrrh, going to carry it down to Egypt." And so for years, and hundreds of years, he has continued to be employed, and as doubtless, will continue to be, until steam and railways shall have traversed all lands, and brought animal transportation into neglect and disuse.—Zoologically, the camel is divided into 2 species: the Bactrian camel (*camelus Bactrianus*), which has 2 humps, and is the camel proper; and the

Arabian, or one-humped camel (*camelus Arabicus*), sometimes improperly called the dromedary. Improperly, because the word dromedary is merely a Greek term applied to one particular variety of the Arabian camel, and that probably an accidental one, in consequence of its extraordinary speed; dromedary in Greek being equivalent to courser in English, which quality no more belongs to all Arabian camels than it does to all thoroughbred horses. Camels have 34 teeth; 16 in the upper jaw, namely, 2 incisors (for the canines and molars have these, and form the exceptions, the other ruminants being without any incisors in the upper jaw), 2 canines, 12 molars; 18 in the lower jaw, namely, 8 incisors, 2 canines, and 10 molars. The incisors of the upper jaw bear a close resemblance to canine teeth, for they are conical, compressed at the sides, pointed, and somewhat curved or hooked. There is another difference between the camels and the other ruminants: the former have the scaphoid and cuboid bones of the tarsus separated. Instead of the great horny case or shoe which envelopes all the lower part of each toe, and determines the figure of the solitary clover hoof, the camels have only a small one, or rather the rudiments of one, adhering to the last joint of the toe, and symmetrical in form like the hoofs of the *psalidodermata*. These and other peculiarities of form lead to the opinion that the camels and llamas form the link between the *ruminantia* and *psalidodermata*. The limits of this work will not permit a close investigation of the anatomical and structural peculiarities of this curious and interesting animal; but that observing writer on zoology, Mr. William J. Broderip, has so agreeably combined an account of the most remarkable particulars, natural and historical, of the "ship of the desert," as he is poetically called by the natives of his arid wilds, to whom he is the one indispensable possession, more so than the reindeer is to the inhabitants of the far and frozen north, that no apology is needed for extracting some of his accounts and facts, slightly abridged, not—those completed—for alluding, shortly, to a report to the department by a gallant officer, Major Wayne, in relation to the naturalization of the animal in the United States. It may be observed here that the camel is one of the animals set forth in the forbidden list in Leviticus, because he "cheweth the cud, but divideth not the hoof;" the object of which mysterious dispensation, no writer, physiological, zoological, or other, has hitherto, it is believed, been able even to divine. "Viewed with the eye," says the able naturalist alluded to above, "of even a comparatively careless observer, the camel presents one of the most complete instances of design with relation to human wants. There is not a part of its structure, from the heavy framework of its skeleton to the external hair of its coat, that could be omitted without injury to the wonderful work, or improved. Those very parts which seem deformities are absolutely necessary to its well-being and destination, and the hump and callosities between

beauties, when examined with reference to the exigencies of the animal, and its condition as the slave of man. And here arises the question whether this hump and these callosities are natural formations, or due to the pressure of the loads with which the animal has for ages been burdened, and to the weight of the body. The callosities are 7 in number, and upon these the pressure of the body is thrown when the animal kneels and rises up. They have been observed upon a newly born camel; but no child is born with corns upon the toes and feet, whatever fashion and tight shoes may have done for the parent; at least I never heard of a baby who came into the world with those exorciating appendages. Not that it may not be admitted, that in a long course of years those marks of servitude, as they have been called, may have been more largely developed. Dr. Walter Adam, in his paper on the osteology of the Bactrian camel, remarks that the dorsal vertebrae of the animal on which he made his observations had been modified by the pressure of its loads. We know that, by careful breeding, the horns of the ox and the sheep may be made to assume almost every grade of excess or defect, until they vanish altogether, and a hornless race is obtained. Now, whether we look at the grotesque figure of the camel or investigate its internal structure, we find the most unmistakable evidence of adaptation to that state of life to which it has pleased the great author of its being to call it. Born for the desert, the callosities prevent the skin from cracking at those points where the weight of the animal rests upon the arid burning sands. The strong, nipper-like upper incisor teeth are fit instruments for cutting through the tough plants and shrubs, that spring here and there on those boundless wastes. The nostrils are so organized that the animal can effectually close them, and defy the stormy, destructive sand-drifts that sweep harmlessly by him. The 'desert ship' seems to float rather than step on the elastic, pad-like cushions of its spreading feet, moving as noiselessly as Mr. Marks's vulcanized Indian rubber wheel tires convey a carriage over a granite pavement. 'What always struck me as something extremely romantic and mysterious,' writes Mr. McFarlane, 'was the noiseless step of the camel from the spongy nature of his feet. Whatever be the nature of the ground—sand, or rock, or paved stones—you hear no footfall. You see an immense animal approach you stilly as a cloud floating in the air, and unless he wear a bell, your sense of hearing, acute as it may be, will give you no intimation of his presence.' Riley, too, observes the silent passage of a train of camels up a rocky steep, and accounts for the silence, because their feet are as soft as sponge or leather. The structure of his stomach enables the camel to digest the coarsest vegetable tissues, and he even prefers such plants as a horse would not touch to the finest pasture. He is satisfied with very little, and if he should be stinted even of this hard

fare, the fat hump contains a store of nourishment to be taken up into the system, and sustain it till it reaches some oasis of tough prickly bushes, which he discusses with the greatest relish; and, if the best of liquids be there, fills the water tanks with which his interior is fitted up, and goes on his way rejoicing.—Dr. Adam suggests that it is not improbable that the symmetry of the swift dromedaries will be found to be much more complete than that of the baggage camel. The load for the latter is variously stated; some make it 600, some 700, and others above 800 pounds; nay, Sandys says that he will carry 1,000. The swiftness of the dromedary, *el heirie*, or as most travellers call it, *maherry*, may be compared with that of the high-mettled racer, with more endurance. 'When thou shalt meet a heirie, and say to his rider, "Salem Alick," ere he shall have answered thee "Alick Salem," he will be afar off, and nearly out of sight, for his fleetness is like the wind.' A *sabayee*, said to be the swiftest of this breed, is good for 630 miles, 85 days of caravan travelling, in 5 days. Seven or 8 miles an hour, for 9 or 10 hours a day, is stated to be a common performance; and the late lamented Captain Lyon, whose accuracy was strict, relates that a northern African maherry's long trot, at the rate of 9 miles an hour, will endure for many hours together.—'Train up a child in the way he should go,' and, acting upon this principle, the camel drivers of some parts of Africa, Senegal, for instance, were wont, soon after the young camel was born, to tie its feet under its belly, throw a large cloth over its back, and place heavy stones upon each of the corners of the cloth that rested upon the ground. Thus did the Moors accustom the animal to receive the loads which it was destined to carry through a life of labor, generally prolonged to 20 years. Females, indeed, and such fortunate males as are exempt from work, are said to live to 25, or even 30 years. The European mode of training the camel is not commenced till it has attained the age of 4 years, when the trainers first double up one of the forelegs, which they bind fast with a cord; this they pull, and so compel the trainee to come down upon his bent knee. But all pupils are not equally docile; and, if this method should fail, as it sometimes does, both legs are tied up, and the camel falls upon both knees, and on the callosity which protects the breast. This operation is often accompanied by a cry and a slight application of the whip from the trainer; and, by degrees, the animal learns at last to lie down upon its belly, with its legs doubled under it, at the well-remembered cry and blow, accompanied by a jerk of the halter. Having attained so much obedience, the trainer proceeds to place a pack-saddle on the creature's back. When it is accustomed to this appendage, a light load is put on and gradually increased till it reaches the maximum, which is understood to be 14 kilogrammes, or above 800 pounds,

for a full-grown camel. Such is the mode practised at Pisa; and though the Moors brought the animal into Spain, Pisa seems to be the only locality in Europe where the camel is now bred.—But although success attends it, the breed seems to dwindle. The foal is obliged to be held up by attendants to take the maternal nourishment which, in a state of nature, the new-born creature must be in a condition to obtain without assistance, or the continuation of the species must cease.—For those who desire to read a collection of the most agreeable anecdotes, and of curiously compiled historical facts, concerning the habits of the camel, its loves and antipathies, its employment as an animal of warfare by the ancients, the vast hosts collected in the armies of Semiramis, Cyrus, and Xerxes, their being harnessed to scythed chariots, the predilection of lions for their flesh in preference to that of any other animal, and the consequent impossibility of their successful introduction in northern Africa until the Romans had abolished the laws for the preservation of lions in that region, which was the great preserve of those cruel carnivora for the supply of the circus *maximus*, no book can be recommended equal to that already named. Brederip's "Lectures from the Note Book of a Naturalist." One other particular he notes, well worthy of observation, since the power of conveying water has been denied to the camel by many, and the possibility of extracting that necessary liquid from his stomach, after death, has been denounced as a falsehood. It now appears that, although the cavity, peculiar to the camel, may not deserve the name of a fifth stomach, and is used for the reception of the rummaged food, it yet contains a peculiar system of cells adapted to contain water, and provided with a reticulated apparatus for closing these cells while the dry foal is in the water bag, which possesses precisely the qualities heretofore ascribed to it. "Then," says Mr. Brederip, "if we want extrinsic evidence, we have only to call one of the most truthful, available witnesses that ever left friends to lament him. Capt. Lyon, upon the occasion of a death of one of these animals, says, in his most interesting narrative: I never before had an opportunity of observing how water is procured from the belly of a camel to satisfy the thirst of an almost perishing caravan. It is the false stomach which contains the water, and the undigested food. This is strained through a cloth, and then drunk, and from those who have been under the necessity of making use of the beverage, I learn that the taste is bitter. As the animal had recently drank, its stomach was nearly full."—From Major Wayne's report we learn several curious facts not mentioned above, in relation to the natural history of this singular beast, and have much valuable information concerning the progress and prospects of its successful naturalization in the United States. "The Bactrian species is found only," as a commentator on the report in the "Nation-

al Intelligencer" informs us, "on the southern border of Siberia, in a portion of Tartary, and in the Crimea, and is a much heavier built, stouter limbed, and stronger animal than the Arabian. From the difficulty of loading it, on account of its 2 humps, its usefulness as a beast of burden is limited. It is sometimes, however, used for draught, being yoked to a wagon as ours are. The great value of this camel is not so broad, for crossing the male Bactrian with the female Arabian, the produce being a powerful one-humped hybrid; and for this purpose it is kept throughout camel-land, as breeding stallions are with us. The Arabian camel, to which variety belong most of the specimens brought to this country, is found throughout camel-land, and furnishes beasts both for burden and for riding. Its powers and hardiness vary with climate and breeding, and as a general rule its strength and endurance are greater the further north it is found." Of the hump, Major Wayne speaks as follows: "This peculiar characteristic of the camel, viewed, when its purpose is understood, in connection with its ability to carry its own supply of water for several days, exhibits one of those wonderful adaptations by the Almighty of animals to country, that excite our admiration and reverence. Composed of gelatinous fat, it contributes a stock of provision that by reabsorption furnishes the animal with sustenance, when the nature of the country, or any other unfortunate contingency, deprives it of a supply of food sufficient for its exertions. Stored thus, by the wise arrangement of Providence, with water and food to meet, for several days, should necessity or misfortune require it, the exigencies of an arid and unproductive country, the camel has, not inaptly, been called the ship of the desert. So well is the use of the hump understood in the East, that the condition of the animal is judged of, and its improvement, after a long journey, measured by it. It is not uncommon to see camels come in, after long and painful journeys, with backs almost straight, exhibiting but little if any hump. Beyond this supplying with food by reabsorption, the hump does not seem to be intimately connected with the animal's vitality; for Lieut. Bey informed me that he had repeatedly opened with a sharp knife the humps of his dromedaries, when from high feeding they had become so plump as to prevent the fitting of the saddle, and removed large portions of the fat, without in any manner injuring or affecting the general health of the animal." In regard to the usefulness and adaptation to one sort of labor of the Arabian camel, and the comparative uselessness for other modes of employment, Major Wayne's account is, perhaps, the most practical and complete of any that has hitherto been given to the public. "From its formation," he says, "the Arabian camel is calculated for burden, and not for draught, though it has been used occasionally for ploughing, and has been harnessed by the English in India to their field batteries. Its

deep chest and strong fore legs enable it to support well a load placed over them, but its narrow loins, and long, ungainly hind legs, deprive it of the force necessary for the longitudinal strain. Its additional joint, too, in the hind legs, by which it is enabled to kneel down, and take a position particularly suited to the packing of burdens upon its back and of readily rising with them, indicates unmistakably its particular qualifications for that kind of service. Unfitted by the formation of its nostrils and lungs for violent exertion, its long regular strides, however, with its capacity for continuous labor, enable it to make extensive journeys in comparatively good time. It is said, and I believe it, that the camel will, on emergency, travel at its regular gait for 60 successive hours without stopping. Formed rather for a level than a broken country, the camel meets without inconvenience a fair amount of mountain and valley, and is not distressed in ascending or descending moderate slopes although they be long. The foot of the camel, clothed with a tough skin which some assert to be true horn, enables it to travel with facility over sand, gravel, or stones. It will also stand a tolerable degree of volcanic debris or rocky soil, and aided by art—provided with a shoe of hide, iron-shod at the bottom, and attached round the fetlock joint—it traverses these impediments without difficulty, and also ice and snow. In wet, clayey, and muddy soils the camel moves with embarrassment, is apt to slip and slide in it, without the ability to gather itself quickly." Major Wayne also bears testimony to the good quality of the camel's flesh as an edible, representing it as undistinguishable from the best beef, and of its milk as not to be known from that of the cow either by flavor or color. Its capacity to carry weight on continuous journeys he estimates, for the strongest camels, at from 450 to 600 lbs., for the common kinds from 300 to 450 lbs.; and these they will carry from 18 to 30 miles a day, according to the character of the country, whether broken or level, over which they travel, moving for the usual daily travelling time of from 8 to 10 hours. With lighter loads, they will travel a little faster. The saddle dromedary, or swift riding camel, he thinks, will carry from 150 to 300 lbs. continually, travelling from 8 to 10 hours, about 50 miles a day. On emergency, they will make from 70 to 90 miles a day, but only for a day or two, over a level country. There are at the present time in the United States about 70 camels, brought over at 2 importations, the first of 33, the other of 41, the latter being by far the larger animals. The present grand duke of Tuscany has, according to the report, 250, which, although badly cared for, out of condition, and neglected, do the work of 1,000 horses; and here the camels are reported greatly to outdo either mules or oxen. The true land of the camel is not, as many persons suppose, the tropics, or their confines; but, rather, the

northern regions of the temperate zone. They thrive better, and are a larger, hardier, and stronger animal, in central Asia, than in Africa or Arabia, and are at least as impatient of extreme heat as of intense cold. Still, it is a matter of doubt how far they will endure the rigor of the overland California passage and the inclemency of the mountains; and it is more probable that their utility will be restricted to the southern routes to the Pacific.

CAMEL, a machine for partially lifting ships so as to float them in shoal water, as over bars. It was invented and first applied by the Dutch about the year 1688, in order to carry their ships over the sands of the Zuyder Zee. It consisted of 2 similar-shaped vessels about 127 feet long, 22 feet wide at one end, and 13 at the other. These being brought one on each side of the ship, and secured to it by ropes passing under the keel from one to the other, water was let into each till it sunk nearly down to the surface, the ropes being kept tight by windlasses or capstans on the decks of the camels. The water being then pumped out, the camels as they rose lifted the vessel with them. For large ships heavy timbers were run out of the port holes, which took the strain as the camels rose under them. Similar machines are used for carrying vessels over the bar of New Bedford harbor, and at Nantucket. Floating docks are constructed on the same principle, and vessels are often lightened by the use of empty casks floated on each side, and drawn down by ropes passed under the keel.

CAMELS' HAIR. The hair of the camel is an article of commerce in the East, where it is largely used for other purposes than that to which it is applied in other countries. The rough fabrics of the middle ages, called *camelinum* and *camelatum*, were woven of this material, and the Arabs now make of it stuffs for carpets, tents, and wearing apparel; and the Persians use it for like purposes. The French apply it to the manufacture of hats. The fine hair used for pencils of artists is imported from Smyrna, Constantinople, and Alexandria. It is obtained from Persia, and is distinguished by three qualities—black, red, and gray, of which the best is the black; the gray is estimated worth only half as much as the red. See BRUSH.

CAMEL'S RUMP, or CAMEL'S BACK MOUNTAIN, 17 miles from Montpelier, Vt., is one of the highest peaks of the Green mountains. Elevation, 4,188 feet above tidewater. From certain points of view it bears some resemblance to a crouching lion, and is occasionally called by a name given to designate this peculiarity.

CAMELLIA, a genus of shrubs belonging to the natural order *ternstroemiaceae*, and furnishing the domestic drug tea and some of the most beautiful of cultivated flowers. All the species are natives of China, Japan, or Nepal. They were first imported into Europe by a German Jesuit named Kamel, about the year 1789; and hence the name of *Camellia*. They are polypet-

dous cotyledons, with alternate feather-veined leaves, regular flowers, the petals and sepals both imbricated in disposition, and have some affinity with the rose tribe. The *C. borea* and *siatica* are the species whose dried leaves make the tea of commerce. None of the species bear fragrant flowers. The *C. japonica* is called by the French *la rose du Japon*, or *la rose de la Chine*. It has broad shining leaves and beautiful red or white flowers, single or double, and is the origin of nearly all the varieties now cultivated in gardens. It is greatly admired in China and Japan, and is of frequent occurrence in Chinese paintings. Many of its varieties have been created by the skill of the Chinese, and are remarkable for their brilliant colors and the exquisite symmetry with which their petals are arranged. These have been imported into Europe and America, and new varieties are annually produced by horticulturists. Forty-five standard varieties have been developed, some having single, some double, and some semi-double flowers, and being in color, white, red, yellow, or variegated. Camellias thrive best when treated as conservatory shrubs, planted in the open border under glass, freely exposed to light and air, and sufficiently protected from the frost. Thus treated, they become large evergreen bushes, densely covered with foliage, upon which their splendid flowers are conspicuously beautiful, and much more brilliant than when the roots are confined in garden pots and cramped for want of room. They are propagated by cuttings, layers, and buds, as well as by seeds. Only a few seeds, however, can be obtained, and these require 2 years to come up, but make the best stocks of any. The *C. reticulata*, which grows in China, is esteemed the handsomest of all the varieties. Its leaves are remarkably netted, and it has semi-double flowers, of a deep rose-red color, sometimes 6 inches in diameter. Two species, the *C. sasanqua* and the *C. oleifera*, are cultivated as oleaginous plants in China, and the oil pressed from the seeds is said to be equal to the finest quality of olive oil. Attempts are now in progress to naturalize this very useful plant in the south of France, and in the French possessions of Algiers.

CAMELOPARD (*Giraffa camelopardalis* of most authors; *cerus camelopardalis* of Linnæus), the giraffe, or camelopard; an African genus of the ruminants, with persistent horns, common to both sexes, having but a single species, as above. The characteristics of this singular animal, which appears, in some particulars, to participate in the qualities of the camel, the ox, and the antelope, are these: The lip is not grooved, is entirely covered with hair, and is very much produced before the nostril; the hoarse is extremely long and prehensile, capable of being protruded or retracted at will, and of being tapered so as to enter the ring of a small key; the neck is very long, the body does, hind part lower; false hoof none; tail straight, with a tuft of thick hair at the end. It is the horns, however, which constitute the

principal generic characteristic; since they are not, correctly, horns of either form, that of the *bovæ*, which are hollow and persistent, or that of the *cervidæ*, which are solid and annually renewed, but are, in fact, bones, exhibiting throughout precisely the same structure as the other bones, united to the frontal and parietal bones by a distinct suture, covered with a hairy skin, and terminating in a ring of bristly hairs at the summit, surrounding a large space. These bristles, according to some naturalists, want only the gluten to cement them into true horns, and embody the animal in the systematic arrangement of the *cervidæ*. The camelopard is assimilated to the camel by the length of its neck, by the callosities on its chest and knees, and by its having no false hoofs; to the other ruminants by the structure of its stomach and digestive organs generally, and by its non-possession of the reticulated water bag, peculiar to the "ship of the desert." To the antelope it is assimilated by the fact that the coils of its colon are spiral, and that its cesum is simple. To the solid-horned deer, which shed and renew these appendages annually, it is connected by what is assumed to be a fact, its having no gall bladder. It seems doubtful, however, whether this can be considered as fully established; since, of 3 individuals dissected by Professor Owen, 2 males had no trace of a gall bladder, while the 3d, a female, had a double gall bladder, each bladder of the usual size. This last has been held to be an abnormal case and the animal a monstrosity, and the camelopard is consequently classed, in this respect, with the deer and antelope, in which the absence of the gall bladder is the rule. In its dental system, the camelopard offers the same formula with the deer, goat, antelope, sheep, and ox, namely: incisors 2; canines 2; molars $\overline{2}$ = 32. The nostrils of the camelopard are provided with cutaneous sphincter muscles, and can be shut at will like the eyes. The eyes are beautiful, extremely large, soft and brilliant, and are so placed that the animal can see much of what is passing on all sides and even behind it. Thus it is approached with the greatest difficulty; and if surprised or run down, it can direct the rapid storm of kicks, by which it defends itself, in the most accurate manner. Its horny hoofs are divided, and it wants the 2 small lateral toes generally seen in the true ruminants; from which this, again, distinguishes it.—In this truly singular and beautiful animal, as in all the works of nature, appear, not, as the carping Hufscholter constantly asserts, malformations and deficiencies, which render the creature unhappy and ill at ease, but the most extraordinary adaptation of all its parts, and application of all the contrivances of its mechanism, to the very stage and the very part on and to which it is a figure among the wonderful works of creation. Many things, given to other creatures in accordance with their wants, are denied to this, because they would be in this case wholly useless; while others, unknown to the rest, are bestowed on it in abundance,

Thus the immense length of its legs and height of the animal at the withers, raising the insertion of the neck, long and towering as is that portion of its frame, to such a distance from the ground that the animal can graze on an even surface only with difficulty and by straddling the fore legs wide apart, enables it to feed on what it prefers as food, and finds in abundance in the sandy and arid tracts where the superficial vegetation of the soil, except at certain seasons, is scarce, dry, and innutritious, namely, the delicate and succulent leaves and twigs of the tallest trees, particularly those of a species of mimosa peculiar to the districts which it inhabits. The peculiar conformation of the extensile and prehensile tongue, which is furnished with rough papillæ capable of voluntary erection, enables it to gather and collect into little bundles the soft leaves which it loves, in a degree scarcely inferior to that possessed by the proboscis of the elephant. The same quality is observable in the prehensile upper lip of the moose deer, which, like the giraffe, is not principally a grazing, but a browsing, animal. Its eyes, such as they are described above, give it facilities for avoiding stealthy attacks, which probably are those alone to which it is usually subject; since the only beasts of prey, of the regions which it inhabits, likely to attack it, the lion and the leopard, invariably attack by surprise and at a single bound, which missed, they both sullenly retreat without any effort to pursue. Again, its speed, which has been represented by some writers as contemptible, owing to a certain awkwardness in the management of its limbs and slowness in getting under way, is by no means so, in truth; as is shown by the statement of all hunters who have pursued it, particularly the African Nimrod, Capt. Gordon Cumming; all of whom testify that, being a timid and wary animal, and always securing for itself a good start, it is not easily overtaken, except by a swift horse. Its paces are a trot, a pace with both legs moved on the same side, and a regular gallop, by changing from one to the other of which, with no apparent diminution of its speed, it can keep up a considerable rate of going—not of course equal to that of the deer, antelope, greyhound, or race-horse, but in all respects sufficient for its purposes—for a long continued space of time and distance. Where water and pasture are to be found only at long intervals, and where swift pursuit is not a contingency naturally to be provided against—since Cumming, mounted on Colesbergs and armed with 2-grooved rifles, do not come within the category of the natural enemies of the giraffe—the power of continued locomotion for great distances is a far more necessary qualification for a life in the desert, than that of exerting a great turn of speed over a short course. It has been said that it has not strength to defend itself, but Le Vaillant, who is the first well-informed modern zoologist who saw it in a state of nature, asserts that “he

knows beyond a doubt, that by its kicking it often tires out, discourages, and even beats off the lion.” The same fact is shown by Capt. Cumming’s mention, on more than one occasion, of his seeing or killing camelopards with large unhealed wounds on their shoulders and haunches, made by the cruel claws of lions, which in those cases must actually have succeeded in their first spring, and then been shaken from their hold by the muscular power, and beaten off by the iron heels of this nominally defenceless ruminant. Of the strange adaptation of the camelopard to the country and scenery he inhabits, the observant naturalist and sportsman—to whose enterprise we owe so much of our knowledge of the fauna of southern and central Africa, yet to whom we can scarcely pardon his wholesale butchery of animals so beautiful, so inoffensive, so harmlessly happy in their central wilds, and so utterly useless and unprofitable when slain, as the giraffes, which, by his own account, he shot down by scores, unresisting and weeping in their agony, not at a single shot, but by the slow torture of protracted volleys—speaks as follows: “I have often traced a remarkable resemblance between the animal and the general appearance of the locality in which it is found:” and then, after pointing out many such analogies between ordinary small animals, reptiles, and insects, and the natural objects among which they live, he proceeds thus: “In like manner, among quadrupeds, I have traced a considerable analogy; for even in the case of the stupendous elephant, the ashy color of his hide so corresponds with the general appearance of the gray, thorny jungles which he frequents throughout the day, that a person unaccustomed to hunting them, standing upon a commanding situation, might look down upon a herd of elephants, and fail to detect their presence. And further, in the case of the giraffe, which is invariably met with among venerable forests, where innumerable blasted and weather-beaten trunks and stems occur, I have been repeatedly in doubt as to the presence of a troop of them, until I had recourse to my spy-glass; and on referring the case to my savage attendants, I have known even their optics to fail—at one time mistaking the dilapidated trunks for camelopards, and again confounding real camelopards with those aged veterans of the forest.” The camelopard, when fully grown, appears sometimes to attain a height of 15, 16, and even 17 feet. It was formerly believed almost universally, though quite erroneously, that the fore legs are much longer than the hinder ones, the very reverse being the case; as, in fact, on examination of the skeleton, taking the legs only from the setting on, the hind legs are the longer by about one inch. The great development and height of the withers, which are needed to give a proper base to the long neck and towering crest, have been the cause of this error; the same mistake has prevailed in regard to the American moose deer, the withers of

which have the same extraordinary elevation above the shoulder, with a comparatively short and muscular neck. This erroneous opinion is observable in the following dimensions, which are given of a male camelopard killed in the country of the Namaquas in 1751. The measurements of the hind and fore legs are to be understood as being taken from the withers and the croop to the ground respectively, and not from the insertion of the legs.

Length of the head.....	1 2
Fore leg, from below to upper part.....	10 0
From upper part of fore leg to the top of the head.....	7 0
Upper part of fore leg to upper part of hind leg.....	6 6
Upper part of hind leg to the tail.....	1 6
Height of the hind leg, upper to lower part.....	8 6

This animal, therefore, was probably 17 feet in its full reach from the earth to the crown of the head. One mentioned as killed by Mr. Paterson was 16 feet in height, but of the 8 recently alive in the zoological gardens at London, one, Gib Allah, male, measured, in all, 13 ft. 8 in., withers 7 ft. 11 in., croop 6 ft. 11 in.; Selim, male, in all, 12 ft., withers 7 ft. 5½ in., croop 6 ft. 7 in.; Zaida, female, in all, 12 ft. 11 in., withers 7 ft. 4 in., croop 6 ft. 7 in. None of these were supposed to be full-grown, although the female had produced 3 young ones, notwithstanding which she was still growing.—The color of the camelopard varies, both in its intensity and in the mode of its variegation. The head is generally of a uniform reddish brown; the neck, back, and sides, outside of the shoulders and thighs, varied with large tessellated, dull, rust-colored marks of a square form, with white septaria, or narrow divisions; on the sides the marks are less regular; the belly and legs are whitish, faintly spotted; the part of the tail next to the body is covered with short, smooth hairs, the trunk is very slender, and toward the end the hairs are very long, black, and coarse, and form a great tuft hanging far beyond the tip of the trunk. The coloring of the female is less vivid than that of the male; she is somewhat smaller, and has the peculiar protuberance of the frontal bone between the eyes, which is common to both sexes, and which by some writers has been called a rudimentary horn, less strongly developed than the male animal.—The camelopard has been long known to history. It occurs on the painted walls of the sepulchre of the Memnonium, discovered and described by Belzoni; and is also represented on the celebrated Friesian pavement, said to have been constructed by the orders of Sylla, who had served as conqueror in Numidia. It was exhibited in the circus *maximus* by Julius Cæsar, alive, for the first time in Europe, but was afterward a frequent spectacle at the cruel shows of Rome. Quædan, the third of the name, once exhibited 10 together on a single occasion. It continued to be known and described by travellers, but few have been brought into Europe until very recently. One was presented by the prince of Damascus to the emperor Frederick II., in the early part of the 13th century; another was given

in the 16th by the sultan of Egypt to Lorenzo de' Medici, and none were introduced subsequently until the year 1827, when 2 giraffæ were sent by the pasha of Egypt, one to France and the other to England, the former of which lived some time in the *jardin des plantes*; but the latter died soon after its arrival at the royal cottage, in Windsor park. Subsequently specimens were forwarded to Venice and Constantinople, by the same magnificent potentate, whose successor has recently enriched the English collection with a living hippopotamus. One was exhibited in this country in 1833 and several others since. In 1836, the London zoological society imported 3, 2 males and 1 female, at the expense of £12,000, or nearly \$12,000. One of the males died shortly after their arrival, but the others, the measurements of which are given above, are still, it is believed, thriving; and, having several times reproduced their kind, they may be supposed to be thoroughly acclimated. In its natural, as in its domesticated state, the camelopard is a gentle, timid, shy, and inoffensive animal; yet it is extremely docile in confinement, feeds from the hand, licks the hand which feeds it, and becomes friends with those who are kind to it. Its natural range appears to be all the wooded parts of eastern, central, and southern Africa, from Senegal and Abyssinia to Senegal and the vicinity of the settlements of the Cape of Good Hope, although, like all wild animals, it retreats as the white man advances, and recedes before the approach of civilization. In domestication it serves no purpose but to gratify curiosity and to promote the study of nature, since it is unfit for draught; and although its flesh is said by hunters to be eatable, it is not suitable for furnishing either meat or milk.

CAMELOPARDALUS, the camelopard or giraffe, a constellation instituted by Hevelius. It lies between the N. pole, the Waggoner, Cassiopeia, and the head of the Great Bear, and contains small stars of the 4th magnitude only.

CAMENZ (Ger. KAMENZ), a town of Saxony, on the White Elster, pop. about 4,600, the birth-place of Lessing, and containing a hospital dedicated to his memory, Jan. 3, 1826. The town was almost wholly destroyed by fire in 1742, but has been rebuilt since.

CAMEO, originally a gem in different colored layers, carved in relief with figures that contrast with the color of the background. Varieties of chalcedony, onyx, and sardonyx are the most common gems used; but softer and cheaper materials are of late much employed for this purpose, which will be noticed below. Cameo-cutting is an art of remote origin, and the word is of obscure derivation. It is referred by some to the oriental word *camchiya*, signifying another stone, or one stone placed upon another; to the Arabic word *camasa*, signifying relief, boss; and by others to the Greek *καμπε*. Lat. *camæra*, a vault, or an arched covering, in a similar sense to the last. The art was certainly practised by the Egyptians, and was brought to a high state of perfection by the

Greeks; and yet it is probably not so old as the simpler process of carving in intaglio. Beside employing the natural gems, the Latins made use, in the time of Pliny, of an artificial paste in 2 colors, called *vitrum obsidianum*. But the hard stones used by the Greeks, by the delicacy of finish of which they are susceptible, and by the durability of the lines carved upon them, have proved a better material for transmitting to distant ages an idea of the high attainments of this cultivated people in art, than either bronze or marble. Neither the one, shrouded in its prized patina, nor the other, disguised in *quasi* restorations, can convey an idea of the patient labor and exquisite skill that curled the hair of Hercules, or brought out the expression of disdain that inflated the nostrils of Apollo, or the supreme intelligence beneath the helmet of Minerva, or of power, controlling gods and men, in the mien of Jupiter. Even now connoisseurs distinguish between modern gems and those cut more than 2,000 years ago, by the superior polish of the latter. In the 4th century, cameo-cutting had fallen into disuse, the art ending, as it began, in lifeless stone. On its revival in Rome, in the 15th century, gem-engraving received especial patronage from Lorenzo and Pietro de' Medici. Specimens of this period rival in perfection those of more ancient times. The art has since continued to be extensively practised in Italy; but its adoption in other parts of Europe can hardly be referred beyond the present century. The chief peculiarity of the Italian style is the converting of blemishes in the material into points of attraction, and bringing them boldly out in alto rilievo, as if designed for some special representation; while the Greek, seeking perfect harmony in the colors of the gem, by a series of subtle curves and most delicate lines running through its low relief, effectually concealed the labor, made so obvious in the productions of later times. The first cameo of which we have account is that of Polycrates' ring, by "Theodorus of Samos, son of Telectes the Samian." Among the finest cameos are those in the imperial cabinet of St. Petersburg; one of Perseus and Andromeda, on a pale brown sard, the figures of exquisite finish in high relief; the other of Ptolemy II. and the first Arsinoë; the same Ptolemy and the second Arsinoë appear on a gem of inferior merit in the Vienna museum. That representing the apotheosis of Augustus, in the *Bibliothèque impériale* at Paris, is the largest and one of the most famous of these works; it is an onyx measuring $12\frac{1}{2}$ inches in one direction, and $10\frac{1}{2}$ in another. This antique cameo contains 22 figures. It is often known by the name of *Agate de la sainte chapelle*, from the holy chapel of the palace to which it was assigned by Charles V. It was there regarded as representing the triumph of Joseph under Pharaoh. It came originally from the East in the time of St. Louis. This collection contains many other choice works of this kind. At Naples is

one ranked among the finest, representing the apotheosis of Ptolemy on one side, and the head of Medusa on the other. Of the ancient cameos, the most noted is the Mantuan vase at Brunswick, representing on one side Ceres seeking her daughter—on the other, the goddess teaching agriculture to Triptolemus.—At Ekaterinburg, in the Ural mountains, Atkinson ("Western and Oriental Siberia," p. 95) speaks of seeing a workman engaged in cutting a head of Ajax, after the antique, in jasper of 2 colors, the ground a dark green, and the head a yellowish cream color, in very high relief, and intended for a brooch. It was a splendid production of art, made, however, at a cost for labor of only 3s. 8d. sterling per month, and 36 lbs. of rye flour. In other countries, where this skill commands higher prices, the great expense of cutting these hard substances has led to the substitution of softer materials, and varieties of porcelain and of enamelled glass are often now used. But the material most extensively employed is the shell of various species of mollusca, which, while it is easily carved, presents layers of a fine natural polish and beautiful colors. The use of shells began in Rome about the year 1820, and for some years the whole consumption was about 800 per annum, all of which were sent from England, and sold in Rome for about 30s. sterling each. In 1847 the consumption had become very large in Paris, so that the sales in that year were reported to amount to no less than 100,500 shells, at an aggregate cost of £8,960. The shells are of 4 varieties only, and known as the bull's mouth, black helmet, horned helmet, and queen conch. Of the first named, 80,000 were sold at an average price of 1s. 8d.; of the 2d, 8,000 at 5s. each; of the 3d, 500 at 2s. 6d.; and of the 4th, 12,000 at 1s. 2½d. The queen conch is referred to by Woodward as the *cassis Madagascariensis*. This and the *C. tuberosa* he describes as presenting a white upon a dark claret color; the *C. cornuta*, white on orange ground; the *C. rufa*, a pale salmon on orange; and *Strombus gigas*, yellow on pink. ("Manual of the Mollusca," pp. 46, note, and 114.) The black helmet is probably the *C. tuberosa*, which, under its commercial name, is elsewhere spoken of as presenting a white upper layer upon a dark, almost black ground. The horned helmet is no doubt the *C. cornuta*. The bull's mouth we judge is the *Strombus gigas*, of which Woodward states 300,000 were brought to Liverpool in 1850 for cameos and porcelain. Although the shells were furnished to the trade by the English, and the value of the cameos produced in Paris in 1846 was estimated at £40,000, there were at that time not more than 6 persons employed in the art in England.—Cameo-cutting, in this country, can hardly be said to be introduced as a branch of business. The beauty and neatness of the process has caused it to be taken up by amateurs, and it is practised for amusement by gentlemen and ladies, the pieces of shell being prepared and fur-

ished to them by the lapidaries. These pieces are cut out of the required size by a metallic blade fed with diamond dust, or emery and water, and are then shaped by grinding and wheeling. Each piece is then mounted upon a stick, which serves as a handle during the operation of cutting. The design is marked out with a pencil, and then scratched in with a sharp point. The cutting is afterward done with the use of a number of delicate pointed instruments made of steel wire, as also of small files and graters. Helzapsfel ("Mechanical Manipulations," vol. III.) gives particular directions respecting the process. "The general shape should be first wrought, with care to leave every projection rather in excess, to be gradually reduced as the details and finish of the work are approached. To render the high parts more distinct during the process of carrying, it will be found convenient to mark them slightly with a black-lead pencil. Throughout the cutting, great caution should be observed that in removing the white thickness the dark ground is not damaged, as the natural surface of the dark layer is far superior to any that can be given artificially; indeed, should the ground be broken up at one part, it would be requisite from its lamellar structure to remove the entire scale or lamina from the whole surface, a process that will be found very tedious and much more difficult than the separation of the white from the black thickness. In order that the finished cameo may possess a distinct outline at all points of view, it is desirable to adopt the system followed in antique cameos, namely, to leave all the edges of the figure quite square from the ground, and not gradually rounded down to the dark surface. Should the latter method be followed, it will be found that the outline is in many places undefined, owing to the color of the white raised figure of the cameo gradually emerging into that of the dark ground. This evil is entirely avoided by leaving the edge of the figure quite square for the thickness of about $\frac{1}{16}$ of an inch. The surface of the cameo should be finished as neatly as possible with the cutting tools, as all polishing with abrasive powders is liable to remove the sharp angles of the figures, and deteriorate the cameo by leaving the form undefined. When, however, the work has been finished as smooth as possible with the cutting tools, the final polish may be given by a little putty-powder used dry upon a moderately soft tooth-brush, applied with care, and rather to the dark ground than to the carved surface; this is the concluding process, after which the cameo is ready for removing from the block prior to mounting."—Cameos carved in onyx and carnelian demand more skill, as well as labor, than those in shell. A drawing is first made on an enlarged scale, and from this a model in wax of the exact size. The outline is then drawn on the stone, and the engraving is executed with the tools used by the lapidary for engraving seals, being drills of soft metal, as copper or iron, made to revolve rapidly, and fed with

emery and oil. False cameos are sometimes made by carefully cutting out the engraved portion of antique gems and attaching this to a ground of agate of another color. Bandist (*Ancientology*, vol. I. p. 706) refers to some cameos in a slaty kind of onyx, *schistes onyx*, which are brought from China as objects of curiosity. They are sheets of rock resembling very compact slates, and possessing 3 or 4 differently colored layers; one is brown, which is the ground, others red, white, and greenish. In these the Chinese have sculptured various objects, as the interiors of houses, and landscapes, which are sometimes enlivened with figures of men and animals. Some are so large that they may be regarded as bas-reliefs for interior decorations.

CAMERA JEOLIA, a substitute for a bellows, made by a falling stream of water.

CAMERA LUCIDA, an instrument invented by Dr. Wollaston, consisting of a quadrangular prism, used as a mirror. The light coming from an object is made to strike one face of the prism at right angles, then to be reflected from the inside of the 2d face to the inside of the 3d, then thrown out (to the eye of the observer) at right angles to the 4th face of the prism. The instrument is used for drawing outlines, the eye being so held that you look with the upper half of the pupil into the prism, and with the lower half outside the prism at the pencil and paper on which the image seen in the prism appears to lie.

CAMERA OBSCURA, an instrument invented in the middle ages, in which the image of illuminated objects formed by a convex lens is received upon a screen in a darkened chamber, or in a box. It was for centuries used as an amusement, or as a guide in drawing outlines; but, by the invention of Daguerre, was suddenly invested with new and incalculable value as the main instrument in photography.

CAMERARIUS, JOACHIM, a German scholar, born at Bamberg, April 12, 1500, died in Leipzig, April 17, 1574. His proper name was Liebhard, which he changed into Camerarius, in honor of the office of chamberlain, which his ancestors held at the court of the bishop of Bamberg. Educated at Leipzig and Erfurt, his attention was arrested by the writings of Melancthon, and in 1521 he went to Wittenberg to make the acquaintance of that reformer. From this time his life and influence were identified with the reformation. In 1526 he was appointed teacher at Nuremberg, and was afterward sent to the university of Tubingen. The duke of Saxony, a few years later, employed him to remodel the Leipzig university, of which he was afterward appointed rector. In 1530 he was at the diet of Augsburg, and gave important aid in drawing up the celebrated confession of that name; and when, in 1555, it assembled again, Camerarius continued an active and prominent delegate, and in the year following was at Ratisbon in the same capacity. In 1563 he was

called to Vienna by the emperor Maximilian to counsel in the critical affairs of the empire in regard to religion. Camerarius was a scholar of extensive and varied learning. He particularly cultivated medicine, mathematics, and Greek. His works (more than 150 distinct treatises) are mostly on classical and religious subjects. His biography of Melancthon, of which a new edition appeared in Halle in 1777, and his collection of letters of Melancthon, are peculiarly interesting to the student of the times of the reformation.—JOACHIM, son of the preceding, born at Nuremberg, Nov. 5, 1534, died there Oct. 11, 1598, was sent successively to Wittenberg and Leipsic, and also studied with Melancthon. He received a medical diploma at Bologna in 1582. Botany was his favorite study. A genus of plants (*Cameraria*) was named after him.

CAMERLINGO, or CAMARLINGO, one of the highest officers of the Roman court. The cameringo exercises supreme power when the papal chair is vacated, and, as the head of the government, controls the treasury and administers justice. He presides over the apostolic chamber. The present cameringo is Cardinal Ludovico Altieri, and the vice-cameringo is Antonio Matteucci.

CAMERON, a southern county of Texas, bordering on the gulf of Mexico, separated from Mexico on the south by the Rio Grande, and containing 5,460 sq. m. The soil, though fertile and well adapted to cotton, maize, and the sugar-cane, is very little cultivated, most of the wealth of the inhabitants consisting of live stock, the value of which, in 1856, was \$103,240. The surface is dotted with numerous lakes, many of which yield excellent salt. The largest of these, called Sal del Rey, is capable of producing almost unlimited quantities. In 1850 the harvest amounted to 8,700 bushels of corn and 2,000 lbs. of wool. There were 4 churches, and 415 pupils attending public and other schools. The county was named in honor of Capt. Cameron, who fell in the Mier expedition. Pop. in 1856, 3,755, of whom 11 were slaves. Capital, Brownsville.

CAMERON, JOHN, a Scottish theologian born at Glasgow about 1579, died about 1625. He received his education in the university of his native city, and made such proficiency in the Greek language, that at the age of 19 he read lectures in Greek, and discoursed in it with as much ease as the scholars of his day generally did in Latin. This laid the foundation for his distinction. He spent some time in France, where he made the acquaintance of many eminent Protestants, and where he was eventually appointed regent of the university of Bergerac, but soon vacated this chair in favor of that of philosophy at Sedan, which appointment he received through the favor of the duc de Bouillon. The chair of Greek at Sedan he declined. At Sedan he remained but 2 years, removing to Bordeaux. By a provision of the church 4 theological students of promise were

constantly supported from the church funds. Cameron was nominated one of these, and spent the next 4 years successively at Paris, Geneva, and Heidelberg. At the expiration of this time, he returned to Bordeaux. In 1618 he was appointed to succeed Gomarus in the chair of divinity at Saumur. The civil wars by which France was distressed caused the dispersion of the university (1620), and Cameron returned to his native town. Here he received an appointment as regent of the university of Glasgow. As Boyd, his predecessor, had been removed on account of Presbyterianism, Cameron was naturally accused by his townsmen of leaning to Episcopacy. This caused him to resign the office before the expiration of a year. Returning to France, he gave private theological lectures at Saumur, until in 1624 he was appointed professor of divinity at Montauban. The doctrine of passive obedience which he had promulgated, exposed him to the censures of many Protestants, and he withdrew to Moissac, but soon returned to Montauban, where he died of a wound given by an unknown hand. His life and works have been published by Louis Cappel, a professor of Hebrew, and afterward of divinity at Saumur. Cameron held some peculiar doctrines on the action of the will, which distinguished him from the Calvinists, and also sufficiently from the Arminians. His theory of will was based on the position that it could only be acted on by motive appealing through the judgment or intellect. The synod of Dort had promulgated that God operated on the human will by a direct interposition of divine power, restraining and directing its action, and by enlightening the understanding, so that it would influence the will to a given action. Cameron's theory sought to reduce these 2 modes of the divine government of human will into one. He was accused by Calvinists of Pelagianism. He also taught the universality of the effects of Christ's sacrifice, and was designated a Universalist. His followers were styled Amyraldists, and also from him, Cameronites. They are to be distinguished from Cameronians.

CAMERON, RICHARD, the founder of the religious body called Cameronians. He was born in Falkland, Fife co., Scotland, died July 20, 1680. His father was a small shopkeeper, and an Episcopalian. Cameron, having received such an education as the parochial school of his native town was able to furnish followed for a time the religious faith of his father, and was appointed master of the parish school. This made him *ex officio* the precentor of the parish church. But having heard some field-preachers, Richard was converted to Presbyterianism. Resigning his office as parochial master, he was promoted to the degree of field-licentiate, under the imposition of hands by John Welch. The Presbyterians were at that time divided into 2 parties, on account of a bill denominated the indulgence, which, by making their worship legal, was designed to harmonize them with the government and the

established religion. A part of the ministers accepted the indulgence, and their congregations worshipped under it peaceably. But a part refused its protection, and opposed their brethren for acquiescence. The recusants were violent and bitter against the indulged ministers. Cameron soon became a powerful leader of the insurgents, and when the government issued a proclamation to suppress them, he found himself so prominent in the opposition that he deemed it necessary to flee to Holland for safety. He however returned in 1689, and renewed his hostility to the course of the government, and, although he had somewhat compromised himself with the indulged party, pushed his opposition to such an extreme that, soon after the defeat of Bothwell Bridge, he marched into Saughbar at the head of his troops, formally declared war against the government and exasperated the royal troops to an attack near Aird's Moss, in which he was killed, and his head and hands were cut off, carried to Edinburgh, and publicly exposed on Netherlow Port. Before the engagement, he indulged in the severest invectives against the indulgence, and all who favored or accepted it, and was heard to pray that the Lord, in the battle, would "spare the green and take the ripe." His name, first applied to his followers, has been since erroneously extended to the persecuted Presbyterians in general. The 26th regiment, raised at the revolution out of the west country inhabitants, was called the Cameronian regiment, an appellation which it still retains. Cameron was believed by his followers to have prophesied the fate of his hands, on the morning of the fatal engagement of Aird's Moss. He gave special attention to washing them, under the expectation that they were soon to become a public spectacle.

CAMERONIANS, a sect of Scotch Presbyterian dissenters, named after Richard Cameron. James I. had enforced on his Scottish subjects a liturgy which the people abhorred as they would a service to Baal. This exercise of the royal prerogative led, in 1638, to the formation of the covenant, "in behalf of the true religion and the freedom of the kingdom." The organization of the Scottish presbytery was still further completed in the adoption of the Presbyterian form of church government, a Calvinistic confession of faith, and the 2 catechisms, which documents are the standards of the Scottish Kirk to this day. The act of 1661 of the English and Scotch parliaments against conventicles, the legalized persecutions conducted by Turner, Dalziel, and Drummond, the famous writ of *habeas corpus* issued by the king against his Scottish subjects in 1670, the intercommuning expedient of Lauderdale and Sharpe, and the execution of Mitchell in 1679, had all contributed to exasperate the Covenanters to a degree where forbearance ceased to be a duty, in the creed of those stern old followers of Knox. The Covenanters had made a stand at Bothwell Bridge, and had been disastrously defeated.

Many of them had lost courage, and were assuaging themselves from royal vengeance by frequenting the churches of the indulged ministers. But a few, headed by Cameron and Carell, met at Saughbar (June 23, 1680), and there promulgated "A Declaration and Testimony of the true Presbyterian, Anti-Prelatic, Anti-Episcopalian, and Persecuted Party in Scotland," proclaimed war against the king as a tyrant and usurper, and protested against receiving the duke of York in Scotland. Only about 26 horse and 40 foot forces could be mustered to sustain the Saughbar declaration. But these few were not to be dismayed. They boldly took stand at Aird's Moss, Kyle, on July 30 following, where Cameron fell in a skirmish with several of his followers. Carell escaped and continued to preach the doctrines of the sect, in fields and woods. When the royalists added the test (1681), the Covenanters, or Cameronians, as they are henceforth to be known, formally denounced it at Lanark, Jan. 12, 1682, and again affirmed the Saughbar declaration. This they repeated again in 1684, and in 1685, on the accession of the duke of York (James II.), hurled again from Saughbar the same manifesto and protest. Throughout the revolution which followed, the Cameronians maintained the same inflexible hostility to the royal usurpation of religious freedom, and stand to-day where they did in the Saughbar proclamation, though with less fanaticism. They supported the prince of Orange on his assuming the crown of England, but were displeased and disappointed by the form in which the Presbyterian church was restored. In 1709 they exerted all their influence against the union of Scotland and England. They are more properly in Scotland denominated "Old Presbyterian Dissenters," as Calvinistic in doctrine, Presbyterian in government, and dissenters from the church of Scotland. The presbytery of this denomination was not organized until Aug. 1, 1743, when an act of toleration was passed in their favor. There are now 5 presbyteries, united in a synod. Their numbers in Scotland are between 6,000 and 7,000. They have a synod in Ireland, several congregations in England, and in the United States about 80 congregations.

CAMEROONS, or **CAMERONS**, a river of Upper Guinea. It enters the gulf of Biafra by an estuary 30 m. wide, in which are several large islands. Around its mouth the shores are overgrown with mangroves. For about 40 m. above this, it preserves an average breadth of 400 yards, and at a point 90 m. distant from the sea it forms a cataract. During the rainy season it is navigable by vessels of any size, but in the dry season its depth is only from 2 to 20 feet. Its total length is unknown. On one of the islands at its mouth is the town of Cameroons, the centre of an important commerce, importing salt, powder, cloths, hats, and arms, and exporting gum, pepper, ivory, and palm oil.

CAMEROONS' MOUNTAINS, a chain of western Africa. The highest peak, which is

covered nearly to the summit with dense woods, has an elevation of 13,000 feet, and is apparently the commencement of a volcanic range stretching N. E. and uniting with the Mountains of the Moon.

CAMETA, a flourishing town in the province of Para, Brazil. It is situated on the Tocantins, in an extremely fertile district, whose population is 20,000.

CAMIGUIN ISLAND, one of the Babuyanes islands, in the Malay archipelago. It is from 7 to 9 m. long, high, and very hilly. The southern part consists of a mountain formerly a volcano, and coral rocks extend along the shores. The port of San Pio Quinto, on the W. side of the island, is the only place which affords even tolerable shelter for large vessels.

CAMILIUS, MARCUS FURIUS, a Roman magistrate, died of pestilence in 365 B. C., whose name is connected with the greatest events of a long period of the history of the republic, and whose life has probably been adorned with many a legend, appears first as censor in the year 408 B. C., then several times as consular tribune, 5 times as dictator, and twice as interrex. Having served during the siege of Veii, and in the war against Falerii, he defeated, in his 1st dictatorship, the Falisci, Capenates, Fidenates, and other tribes, advanced to Veii, penetrated through a subterranean passage into the city, and thus put an end to its siege, which had already lasted 10 years. He made his triumphal entrance at Rome in a chariot drawn by 4 white horses, and asked the 10th part of the booty, to accomplish a vow to Apollo, for which circumstances his enemies accused him of pride and extortion. But he earned new glory by the conquest of Falerii, which surrendered to his generosity, as proved in the repudiation of an act of treachery committed by a schoolmaster. His continued opposition to the emigration of the people to Veii, rendered him unpopular; accused of having embezzled a part of the booty of that city, he left Rome, and lived in exile at Ardea, when the Gauls under Brennus invaded and pillaged Rome. He repulsed them from Ardea, was secretly recalled by the defenders of the capitol, and appeared at Rome, according to a legend, at the head of an army, at the moment when the gold for which the Romans purchased peace was being weighed before the insulting conqueror. "Rome buys her freedom with iron," he exclaimed, and proved it. He routed the Gauls twice, had a new triumph, was called a second Romulus, and prevailed again against the desertion of Rome, now in ruins. He subsequently defeated a coalition of the Æqui, Volsci, Etrurians, and Latins, was successful in a war against Antium, had to struggle against the rivalry of Manlius, and, as dictator for the 5th time, against the agitation of Licinius Stolo, and was, at the age of 80, once more victorious over the Gauls. Camillus was the resolute champion of the patricians, and resigned his 4th dictatorship in 367 B. C., when he found it

hopeless to resist the increasing demands of the plebeians. He is the great hero of his time, and his virtues and exploits are recorded with exaggerated praise by Livy and Plutarch.

CAMINATZIN, or CACUMAZIN, a Mexican king, died in 1521. He was nephew of King Montezuma, and reigned over Tezcuco, the principal city of Anahuac. The best citizens of the state, the nobles and priests, saw with indignation the humiliation of their king and kingdom under Cortes and the Spaniards. Caminatzin, with more courage and enterprise than his uncle, proposed to his subjects a declaration of war against the foreigners. The proposal was received with enthusiasm, and Caminatzin called upon the Spaniards to leave the country immediately or to expect to be treated as enemies. Cortes was preparing to march his army against Tezcuco, when the representations of Montezuma concerning the defences of the town and the daring of the population, induced him to change his plan, and to resort to treason instead of force. At his instigation Montezuma invited his nephew to Mexico to become reconciled with the Spaniards. The answer of Caminatzin was that he could enter Mexico only to destroy the tyrants of his country. Montezuma then despatched secret agents to Tezcuco to get possession of the young prince by whatever means. His first officers and nearest friends were corrupted, and he was delivered by them to Cortes and imprisoned. He was released after the expulsion of the Spaniards, and is supposed to have perished soon after in the siege of Mexico.

CAMISARDS, French Protestants who rebelled in the Cevennes at the beginning of the 18th century, so called from a kind of smock-frock which they wore, called *camisa*; they are also called Cevenols. As early as the 18th century the Albigenses and Waldenses had taken refuge in the Cevennes; and their opinions, prevailing among a sober and virtuous people, outlived the persecutions to which they were occasionally subjected. After the reformation they adopted the Calvinistic creed. They were of a peaceful disposition; but during the reign of Louis XIV. they were subjected to a long series of violent and merciless persecutions. Prominent among their enemies was the Abbé Duchayla, who subjected many of them to torture. On a night in 1702, a few hundred of them stole to the castle of Pont de Montvert, his residence, seized on the hated priest and murdered him. This was the signal of general rebellion. All the Cevenols, or, as they were now called, the Camisards, flew to arms, incited by their desire for vengeance and incensed by the speeches and prophecies of some among them who pretended to be inspired. "No taxes," and "Liberty of conscience," were the devices inscribed on their standards. They were commanded by bold leaders: Roland, who had served in the army and possessed some military knowledge; Jean Cavalier, a journeyman baker who at once evinced remarkable talents; Ravenal and Abyras Maurel, surnamed Catinat. It was an awful

war. The marshal de Montrevel, who was first sent against them, thought that terror and severity were the only means of subduing such fanatics; he had their villages burned, and all the prisoners hanged or broken on the wheel. The Camisards in their turn burned and pillaged Catholic villages, sacked churches, and massacred priests. At last Marshal Villars succeeded the merciless Montrevel, and tried clemency and persuasion; through skilful negotiations and generous promises, he brought a number of Camisards to terms, among them Jean Cavalier, who was then the eldest and most popular of their chiefs: but this submission, though a heavy loss to the insurgents, did not bring the contest to a close. Cavalier was cursed as a traitor by his brethren; and the other leaders, and especially Roland, continued to resist. But Roland having been killed in 1704 in a night engagement, the hostilities slackened, the country was apparently pacified, and Marshal Villars left it for other service. In 1705, however, Marshal Berwick had again to crush a rebellion. A few years later, through the agency of some Dutch emissaries, a new rising took place in the Viraurais, a part of the Cévennes country; and its suppression was a hard task for the enfeebled government of Louis XIV. The Camisards were honest and virtuous people; but their name was wrongfully assumed by troops of robbers who, about the same period, pillaged some parts of Languedoc.—A new work on the Camisards, by Ernest Alby, was published in Paris in 1855.

CAMLETT, a plain stuff, sometimes wholly of goat's hair; sometimes having the warp of hair and the woof half hair and half silk; sometimes both the warp and the woof of wool; and sometimes the warp of wool and the woof of thread. The true oriental camlet is made of Angora goats' hair. Its name is derived from its having been made originally of camels' hair.

CAMMERHOF, FREDERICK, a Moravian bishop, died at Bethlehem, Pa., April 8, 1751. He came to America in 1740 to assist Bishop Spangenberg as a missionary to the Indians. He remained till 1750 at the Moravian establishments on the Susquehanna, when he went to Onondaga to preach to the Iroquois. In 5 years he had baptized 89 Indians.

CAMOËNS, LUIS DE, the greatest among the Portuguese poets, born in Lisbon in 1524, died there in 1580. His father, who descended from an ancient Galician family, was sea-captain, and was shipwrecked in 1553 on the coast of Goa. Young Camoëns, who inherited an ardent love for the excitement of sea life, and an adventurous disposition generally, commenced his studies in 1538 at the university of Coimbra, and inspired his teachers, Diogo de Teiva, Vicente Falcões, and Pedro Nunes, with great confidence in his genius. He left the university with a high literary reputation; but a passion which he conceived for a lady of the court, Catarina de Atayala, blighted his prospects in the very commencement of his career. The lady's

family discountenanced his suit; and the king, João III., himself supposed to have been in love with the young lady, banished him from the capital. Catarina could not bear the separation from her lover, and died of a broken heart. He survived her about 20 years, but he lived and died a bachelor. In his despair of success, he joined the Portuguese expedition against Morocco, and fought like a lion, but had the misfortune to lose one of his eyes, which disfigured him for life. On his return to Lisbon in 1552, he was again disappointed in his expectations of receiving employment at the court, and proceeded to Goa, where, however, soon after his arrival, he gave offence to the authorities by a satirical poem entitled *Disparates na Índia*, in which, among other discouraging allusions, he says of the Portuguese office-holders in India, that *Pois houve a provisão não cabe nem sãe*: "Honor and self-interest are never found in the same sack." He was banished to Macao, where he received the appointment of *procurador dos defuntos* (administrator of the effects of the deceased), and the salary connected with this office, though very small, was sufficient for his support. The great discoveries which had disclosed to Portugal the Cape of Good Hope and the key to the Indies, the stirring conflicts with the Moors, the efforts of the missionary to Christianize, while the explorer strove to colonize, and above all, the general impetus which, after the advent of Gutenberg, Columbus, and Luther, electrified the mental atmosphere of Europe, and inspired the mass of the Italian and Spanish poets, exerted a powerful influence upon the ardent imagination of the Lusitanian; and with a mind richly stored with classical learning, with a heart purified by his romantic love for Catarina, and the most enthusiastic admiration for the achievements of his native country, Camoëns resolved to do for Portugal what Homer had done for Greece, and wrote his "Lusiad," or *Os Lusíadas*, so called after the mythological hero Lusus, who, in company with Ulysses, visited Portugal and founded the city of Lisbon under the name of Ulyssipolis. This great epic was completed by Camoëns during his stay in Macao, where a grotto is still pointed out to which the poet frequently resorted to write. In 1561 he received permission to return to Goa. But here one calamity after another befell him. First stripped of every thing he possessed by a shipwreck, he was thrown into prison for debt immediately after his arrival at Goa, and detained there until 1569, when he returned to Lisbon, where the rest of his life was doomed to the most abject poverty. King Sebastian granted him a pension of 15,000 reis, equivalent to the small sum of \$31, a year; and this pittance, miserable as it was, was subsequently withheld. For some time he was supported by a devoted Javanese servant, Antonio, who collected alms for him during the night and nursed him during the day; and afterward he was removed to the hospital, where he died. After

his death he was called the "Apollo Portuguese," "Camões o Grande," a monument was erected to his memory, medals struck in his honor; his "Lusiad" was translated into foreign languages, and warmly praised by both Lope de Vega and Tasso. Tieck founded a novel upon the poet's death (*Tod des Dichters*), and Portuguese and foreigners flock to the Lusiad grotto at Macao, which has been adorned in a beautiful manner by Mr. Fitzhugh, an English admirer of the poet. Camoëns' life, which in many respects resembles that of Cervantes, presents a sad record of the struggles of a chivalric man of genius with uncongenial circumstances. Beside the "Lusiad," he wrote sonnets, which are devoted to love, chiefly to his love for Catarina, to the celebration of virtue, and to friendship. In these sonnets he pays a graceful homage to his teachers, and a warm tribute to his friend Noronha. The sonnets written shortly before his death breathe the purest imagination. The most celebrated of his "Redondillas" is that suggested to him by his escape from shipwreck. He also wrote *Canções* on the model of Petrarch's *Canzoni*, odes, sextinas, elegies, stanzas composed in *ottava rima*, eclogues, and 8 comedies, *El Rey Seleuco*, founded upon the well-known anecdote of the king who resigns his wife, Stratonice, to his son Antiochus; *Philedemo*, and *Os Amphitryões*, his most valuable contribution to the Portuguese stage. His fame, however, rests upon his "Lusiad." Patriotism is the leading sentiment of this national poem, which abounds in picturesque descriptions of storms and scenery, and in pathetic allusions to Portugal's influence in extending the area of Christendom. The most remarkable passages are those referring to the tragic end of Inez de Castro, and to Adamastor, the mythological ruler of the sea, who uses his supreme influence for the purpose of stopping the progress of Vasco da Gama. A copy of the 1st edition of the "Lusiad," which appeared in 1572, is in the possession of Lord Holland's family. A magnificent edition was published by Didot in 1817 for the editor, Souza Botelho. His complete works were edited by Barreto Feio and Monteiro, Hamburg, 1884. The best English translation is that of Mickle. The Spanish translators are Gomez de Tapia, Garzes, and Lamberto Gil. The French translation is by Millié, the German by Donner, the Italian by Nervi, and the Polish by Przybylski.

CAMP, a place of repose for troops, whether for one night or a longer time, and whether in tents, in bivouac, or with any such shelter as may be hastily constructed. Troops are cantoned when distributed among villages, or when placed in huts at the end of a campaign. Barracks are permanent military quarters. Tents were deemed unwholesome by Napoleon, who preferred that the soldier should bivouac, sleeping with his feet toward the fire, and protected from the wind by slight sheds and bowers. Major Sibley, of the American army, has invented a tent which will accommodate 20

cavalry soldiers, with their accoutrements, all sleeping with their feet toward a fire in its centre. Bivouac tents have been introduced into the French service since 1837. They consist of a tissue of cotton cloth impregnated with caoutchouc, and thus made water-proof. Every man carries a portion of this cloth, and the different pieces are rapidly attached together by means of clasps. In the selection of a camp, good water within a convenient distance is essential, as is the proximity of woods for fire-wood and means of shelter. Good roads, canals, or navigable streams are important to furnish the troops with the necessaries of life, if they are encamped for a long period. The vicinity of swamps or stagnant water is to be avoided. The ground to be suitable for defence must admit of manœuvres of troops. As far as possible the cavalry and infantry should be established on a single line, the former upon the wings, the latter in the centre. The shelters or huts are arranged, as nearly as the nature of the ground admits, in streets perpendicular to the front, and extending from one end of the camp to the other. In arranging a camp, however, no universal rule can be laid down, but the commander must decide according to circumstances whether to form his army in 1 or 2 lines, and upon the relative positions of infantry, cavalry, and artillery. The guards of camps are: 1, the camp-guard, which serves to keep good order and discipline, prevent desertions, and give the alarm; 2, detachments of infantry and cavalry, denominated pickets, stationed in front and on the flanks, which intercept reconnoitring parties of the enemy, and give timely notice of a hostile approach; and 3, grand guards, or outposts, which are large detachments posted in surrounding villages, farm-houses, or small field works, from which they can watch the movements of the enemy. They should not be so far from the camp as to be beyond succor in case of attack. Immediately after arriving on the ground, the number of men to be furnished for guards and pickets are detailed; the posts to be occupied by them are designated; the places for distribution of provisions mentioned; and, in general, all arrangements made concerning the interior and exterior police and service of the camp.—One of the most ancient camps mentioned in history is that of the Israelites at their exodus from Egypt. It formed a large square, divided for the different tribes, had in the middle the camp of the Levites with the tabernacle, and a principal gate or entrance, which, with an adjacent open space, was at the same time a forum and market-place. But the form, the dimensions, and the intrenchments of the regular military camps of the Hebrews, or their enemies, can scarcely be traced.—The camp of the Greeks before Troy was close upon the sea-shore, to shelter their ships drawn upon the land, divided into separate quarters for the different tribes, and fortified with ramparts fronting the city and the sea, and externally with a high mount

of earth, strengthened with wooden towers against the sallies of the besieged. The bravest of their chiefs, as Achilles and Ajax, were posted at the extremities. The camp of the Lacedæmonians was circular, and not without the regular precautions of sentries and videttes.—The Roman camp varied according to the season of the year, the length of time it was to be occupied, the number of legions, as well as the nature of the ground, and other circumstances. A historian of the time of the empire mentions camps of every shape, circular, oblong, &c.; but the regular form of the Roman camp was quadrangular. Its place was determined by augurs and according to the 4 quarters, with the front to the rising sun; it was measured with a gnomon; a square of 700 feet was regarded as sufficient for 20,000 men. It was divided into an upper and lower part, separated by a large open space, and by 2 chief lines (*decussæ* and *cardo*), running from E. to W., and from N. to S., and by several streets. It had 4 gates, the principal of which were the decuman and the prætorian, which no soldier could pass without leave, under pain of death, and was surrounded with a rampart, separated by a space of 200 feet from the inner camp, a ditch, and a mound of earth. All these intrenchments were made by the soldiers themselves, who handled the pickaxe and the spade as dexterously as the sword or the lance; they levelled the ground, and fixed the palisades, which they carried along, around the intrenchments into a kind of hedge of irregular points. In the middle of the upper division was the pavilion of the general (*prætorium*), forming a square of 200 feet; around it the *vigilaculum*, the *quæstorium*, or quarters of the treasurer of the army, the *forum*, serving as a market and meeting place, and the tents of the *Lepidii*, those of the tribunes opposite their respective legions, and of the commanders of foreign auxiliary troops. In the lower division were the tents of the inferior officers and the legions, the Roman horse, the *tribuni*, the *principes*, the *auxilii*, &c.; and on the flanks the companies of foreign horse and foot, carefully kept apart. The tents were covered with skins, each containing 10 soldiers, and their *decussæ*; the centurions and standard-bearers at the head of their companies. In the space between the 2 divisions, which was called *principis*, were the platform of the general, for the exercise of justice as well as for harangues, the altar, the sacred images, and the not less sacred military ensigns. In exceptional cases the camp was surrounded with a wall of stones, and sometimes even the quarters of the soldiers were of the same material. The whole camp offered the aspect of a city; it was the only fortress the Romans constructed. Among the most permanent materials of the Roman occupation of Britain is the retention of the Latin *castra* (camp), as, in whole or part, the name of a great number of places first occupied by them as military posts, as Doncaster, Leicester, Worcester, Chester, Winchester, &c.—The camps

of the barbarous nations of antiquity were often surrounded with a fortification of wagons and carts, as for instance, that of the Cimbræ, in their last battle against the Romans (101 B. C.), which camp was so fiercely defended, after their defeat, by their wives.—An *Invencuum Camp* is a camp surrounded by defensive works, which serves also as a fortification, and is intended accordingly for prolonged use.

CAMPAGNA, a town of Naples, the see of a bishop, 20 miles E. of Salerno, built in the midst of lofty mountains, and containing a cathedral, churches, convents, a college, &c. Pop. 5,750.

CAMPAGNA DI ROMA, the plain surrounding Rome. It nearly coincides with the ancient province of Latium, and is bounded N. by the Tiber and Teverone, E. by a branch of the Apennines, S. and S. W. by the Mætiterranean, and is about 65 m. long by 48 broad. The land is very plainly volcanic, the lakes lying in craters, and some of them, as Lake Regillus, having a regular conical form. The north and north-eastern part of the Campagna, lying on the slopes of the Apennines, is pleasant and salubrious, but the lowlands are afflicted by a malaria which is disastrous to the life and health of laborers. The Campagna includes the well-known Pontine marshes, which cover a plain some 24 m. long, and from 8 to 19 m. in breadth. These marshes were formed by several small streams, Ufens, Nymphæus, Amnens, and some others, which, finding no outlet to the sea, spread over the land. As late, however, as 312 B. C., it must have been dry, for the Appian way was then carried over this portion of the Campagna. In the course of 150 years the marshes spread out to their present extent. Attempts were made to drain them by Julius Cæsar and by Augustus. A canal was constructed parallel to the Appian way, and Horace speaks of travelling on it in the year 87 B. C. In A. D. 1778 Pius VI. commenced draining the swamp, but without much benefit to the health of the inhabitants. Hot sulphur springs are found between Rome and Tivoli. In early days the Campagna was peopled with many small cities. Of the inhabitants, the Albans were the most powerful. When the Romans conquered them, these cities were destroyed. They were afterward repopled from the capital, but retailing, were punished, and finally were left entirely desolate. In the time of Diodorus, 44 B. C., there was noticeable a decay and desolation in many parts of Italy. Strabo, in A. D. 25, also speaks of this fact. According to Pliny, the farms in the Campagna belonged to proprietors who resided in the city, and left them to the labor of slaves and the care of overseers. Among these slaves, every thing was done to encourage idleness. Pliny states that C. Cæcilius Claudius Isidorus died, leaving 4,118 of them. The climate of this region around Rome has considerably changed since the palmy days of the city. In the year 490

B. C. there was snow upon the ground for 40 days, and now it is rarely present for so long a time as 2 days. During the winter and early spring the vegetation is rich and flourishing, but in summer the Campagna has a dry and barren appearance. The laborers for the farms are peasants from the hills, strong, hardy men, but many of them are always more or less affected by the malaria. The Campagna is divided judicially into the Comarca di Roma, and Frosinone. The principal modern towns are Tivoli, Velletri, Frascati, Terracina, Ostia, and Palestrina. The great interest felt concerning this plain arises from the situation of Rome, whose ruins lie scattered on every side. Across the desolate Campagna stretch the long lines of the aqueducts, whose broken and now useless arches fitly represent the state to which the "mistress of the world" has fallen.

CAMPAIGN. This term is very often used to denote the military operations which are carried on during a war within a single year; but if these operations take place on 2 or more independent seats of war, it would be scarcely logical to comprise the whole of them under the head of one campaign. Thus what may be loosely called the campaign of 1800 comprises 2 distinct campaigns, conducted each quite independently of the other: the campaign of Italy (Marengo), and the campaign of Germany (Hohenlinden). On the other hand, since the almost total disuse of winter quarters, the end of the year does not always mark the boundary between the close of one distinct series of warlike operations and the commencement of another. There are nowadays many other military and political considerations far more important in war than the change of the seasons. Thus each of the campaigns of 1800 consists of 2 distinct portions: a general armistice extending over the time from July to September divides them, and although the campaign of Germany is brought to a close in Dec. 1800, yet that of Italy continues during the first half of Jan. 1801. Clausewitz justly observes that the campaign of 1812 does evidently not end with Dec. 31 of that year, when the French were still on the Niemen, and in full retreat, but with their arrival behind the Elbe in Feb. 1813, where they again collected their forces, the impetus which drove them homeward having ceased. Still, winter remaining always a season during which fatigue and exposure will, in our latitudes, reduce active armies at an excessive rate, a mutual suspension of operations and recruiting of strength very often coincide with that time of the year; and although a campaign, in the strict sense of the word, means a series of warlike operations closely connected together by one strategical plan and directed toward one strategical object, campaigns may still in most cases very conveniently be named by the year in which their decisive actions are fought.

CAMPAN, a French town, pop. estimated at from 3,000 to 4,500, in the department of Hautes

Pyrénées, in the valley of the same name. The valley is bounded by Mont Aigre, traversed by the river Adour, contains the ancient convent of Medous, the priory St. Paul, and the village l'Espoules; is celebrated for its picturesque scenery, for its stalactite grotto, and for its quarries of green, red, and Isabel marble, which extend along the Adour and the road leading to Bagnères de Bigorre. Jean Paul Richter's *Camparthal* was inspired by the beauties of this valley.

CAMPAN, JEANNE LOUISE HENRIETTE GENEST, a French teacher, born Oct. 6, 1752, in Paris, died March 16, 1822, at Mantes. She was appointed reader to the daughters of Louis XV. when only 15, and after her marriage with M. Campan, attached to the person of Marie Antoinette. She showed great devotion to her royal mistress during the revolutionary troubles, and barely escaped with her life on the storming of the Tuileries. Bereft of all her fortune by the revolution, she opened a young ladies' boarding school at St. Germain in 1796, secured the patronage of Mme. Beauharnais, afterward the empress Josephine, attracted the attention and won the esteem of Napoleon, by whom she was, in 1806, appointed superintendent of the school he founded at Écouen for the daughters, sisters, and nieces of officers killed on the battle-field, over which she presided 7 years until it was suppressed by the Bourbons. She was the sister of M. Genest, the French republican minister to the United States, during the 2d administration of Washington. Her works upon education scarcely rise above mediocrity; but her *Journal anecdotique*, her *Correspondance inédite avec la reine Hortense*, and her *Mémoires sur la vie privée de Marie Antoinette* are full of interest.

CAMPANA, a town of Spain, in Andalusia, pop. nearly 6,000; 87 m. E. N. E. of Seville, on the river Madre, near its junction with the Guadalquivir. It has remains of Moorish architecture, one parish church, several monasteries, and 5 schools.

CAMPANA, a village in the province of Verona, in Lombardy. A victory was gained here by the French, under Bonaparte, over the Austrians, Nov. 21, 1796.

CAMPANELLA, TOMMASO, an Italian philosopher, born at Stilo in Calabria, Sept. 5, 1563, died in Paris, March 21, 1639. When very young he displayed unusual aptitude for learning, especially languages. His father wished to send him to Naples to fit himself for a lawyer, but he followed his own predilections, and joining the Dominicans, pursued the study of theology. When but 17 years of age, studying at Cosenza, his professor was engaged to take part in a discussion upon philosophy with the Franciscans; but being somewhat unwell, sent young Campanella in his place, who astonished his audience by the force of his argument against Aristotle. In 1590, he published his own opinions; the work gained him some admirers, but so many enemies that he left Naples

and went successively to Rome, Venice, Florence, Padua, and Bologna. In 1638 he returned to Naples, and went thence to his native place. Being suspected of joining a conspiracy against the Spanish government, he was seized and put to the rack 7 times, and was finally carried to Spain and imprisoned. In the year 1626 Pope Urban VIII. obtained his extradition from Philip IV. of Spain, and he was transferred to the inquisition at Rome. He was set at liberty in 1650. But the Spaniards looked upon him with hostile feelings, and in 1634 he fled to France. Landing at Marseilles, Peirée invited him to Aix, where he spent a few months, and thence went to Paris. By the aid of Richelieu he received from Louis XIII. a pension of 4,000 livres. He entered a Dominican convent, where he ended his life. Campanella had talents, but his imagination held too strong a sway over his reasoning powers. He was distinguished rather for unbecoming other systems than for raising one of his own. His most celebrated works were written during his imprisonment. Among them are the following: *Philosophia Rationalis; Universalis Philosophia; Apologia pro Guillao*, 1639, 4to; *De Prodiis humanae, Electione, Reproductione, et Auxilio Divinae Gratiae, contra Thomisticos*, Paris, 1636; *De Monarchia Hispanica*, translated into English, Lond. 1634.

CAMPANIA, a city of Brazil, pop. 6,000, in the province of Minas Geraes, on the left bank of the Palmello, with churches, schools, a hospital, and some other institutions.

CAMPANI, MATTEO AND GIUSEPPE, two brothers, natives of the diocese of Spoleto, Italy, lived in the latter half of the 17th century. Matteo, the elder brother, or Campani Alimicus, as he was called, held the curacy of a parish in Rome. Both of them are known in science as opticians. Matteo was the inventor of bluminated clock dials, and celebrated for being the first to grind object glasses of great focal length—200 palms, or 150 feet focal distance, being the largest. With Campani's object glasses, 2 of the satellites of Saturn were discovered. Campani also made some experiments with triple eye-glasses, to destroy chromatic aberration. The thermometrical irregularities of pendulum vibrations also engaged his attention. The younger brother, Giuseppe, was also an optician and astronomer, and constructed his own telescopes.

CAMPANIA, a portion of ancient Italy, lying S. E. of Latium, from which it was separated by the river Liris. Samnium bounded it on the N. and E., Lucania on the S. E., and the Tyrrhenian sea on the S. and W. The largest river of Campania was the Volturnus; the smaller streams were the Liris, Clanis, Sava, Sarnus, Silarus, and Sebethus. It also contained several lakes, most of them filling the craters of extinct volcanoes. The largest of them were Acharusia, Lavinia, Locrinus, and Averna, on the W. of the Mount Nevea. Within its borders stood Mount Vesuvius, and there are the bur-

ied cities of Hieraculanum and Pompeii. Beside these, its principal cities were Balis, Nuceria, Neapolis, Salernum, and Capua, which was founded by the Etruscans, who named it after their leader Capys, a companion of Aeneas. In the year 420 B. C., it was subjugated by the Samnites; in 343 B. C. it was received into the protection of Rome, but revolted to Hannibal after his victory at Canus, 216 B. C. It was taken 211 B. C., and punished by the Romans, its senators being executed, and many of the inhabitants sold into slavery. The first inhabitants of Campania were Ausones and Osc or Opici, subsequently conquered by the Etruscans. In the time of the Romans, the Sidicini dwelt in the N. W. near the frontier of Samnium, and the Picentini inhabited the S. E. portion of the country. The region of Campania is decidedly volcanic, and the soil extremely fertile. In some parts crops are harvested 3 times in a year. This fertility, joined with an equable climate, an air mildly tempered by soft sea-breezes, and the most beautiful scenery, gave the title Felix to the land, which it still retains, being now the *Campagna Felix* of Naples.

CAMPANILE (Ital. *campana*, a bell), a bell tower, either attached to a church, or an independent edifice. The most remarkable specimens are those at Cremona, Florence, Pisa, Bologna, Padua, and Ravenna. The tower at Cremona is 395 feet high, 496 steps leading to the summit. It was begun in 1283, and the bells were cast in 1375. In the 3d story is a very large astronomical clock, built in 1594. The one at Florence was commenced by Giotto in 1334; after his death, the tower was continued by Taddeo Gaddi. It is 275 feet in height, and has 4 stories, of which the 1st and 3d are higher than either of the other 2. On the basement story are 2 ranges of tablets in relief, designed by Giotto, and executed partly by him, and the remainder by Andrea Pisano and Luca della Robbia. Above these are 16 large statues, 4 on each side of the tower. The cost of this campanile was very great, about 1,000 florins for each braccio, which is 2 feet square. The leaning tower of Pisa was begun in 1174 by Bonanno of Pisa, and William of Linspruck. It is 178 feet high, cylindrical in form, and 50 feet in diameter. The summit is reached by 230 steps. The fact which gives it the name by which it is so well known, is that it leans 10 feet from the perpendicular. This fault was manifest before its completion, and was guarded against by extra braces, and an adaptation of the stone in the highest portion. The 7 bells on the top, the largest of which weighs 12,000 lbs., are so placed as to counteract by their gravity the leaning of the tower. The Garisenda at Bologna is 155 feet high, and leans 6 feet 6 inches. The Asinelli at the same place is 271 feet in height, and leans 4 feet 6 inches. The Savilla cathedral has a campanile 350 feet high, completed by Guiver the Moor in 1593. This tower is called La Giralda,

from a brazen figure in the top, which weighs a ton and a half, yet turns with the wind.

CAMPANILE, an Italian missionary, born in 1762 near Naples, died in the latter city, March 2, 1835. At an early age he entered the order of St. Dominic, and was employed in teaching in the different houses of the Dominicans. A desire to preach the gospel to the heathen made him enter the college of the propaganda at Rome, where he learned Arabic. In 1802 he was named prefect of the missions of Mesopotamia and Koordistan, and through his zeal and activity 10 large villages joined the Roman Catholic church. In 1815 he returned to Naples, and was appointed professor of Arabic in the university. In 1818 he published a history of Koordistan and of its different religious sects, containing many details respecting the customs and usages of the country, which are considered highly interesting.

CAMPANUS, JOHANNES, an Italian mathematician, author of the first translation of Euclid that was printed, born at Novara, probably in the 12th century. His translation was from the Arabic, and was printed by Ratdolt at Venice, in 1482.

CAMPBELL, the name of counties in several of the United States. I. A southern county of Virginia, lying between James river on the N. and Staunton river on the S., and comprising an area of 576 sq. m. It has an uneven surface, and a fertile soil. Productions in 1850, 2,534,730 lbs. of tobacco, 339,267 bushels of corn, 100,500 of wheat, 167,254 of oats, and 2,168 tons of hay. There were a number of mills and factories, 42 churches, and 994 pupils attending public and other schools. Value of real estate in 1856, \$5,692,854. Iron ore is obtained in some places, and granite is abundant. Oak and pine forests cover much of the hilly part of the county. Organized in 1784, and named in honor of Gen. William Campbell, an officer of the revolution. Capital, Campbell Court House. Pop. in 1850, 230,245, of whom 10,866 were slaves. II. A central county of Georgia, with an area of 360 sq. m., intersected by the Chattahoochee river. It has an irregular surface, and embraces several varieties of soil. The soil of the river bottoms consists of a black loam, and yields good crops of grain and cotton. The productions in 1850 amounted to 271,500 bushels of corn, 27,236 of oats, 44,434 of sweet potatoes, and 3,040 bales of cotton. There were 20 churches, and 450 pupils attending public schools. Gold, iron, and soap-stone are the principal minerals. Value of real estate in 1856, \$1,099,222. The county received its name in honor of Duncan G. Campbell, a member of the Georgia legislature. Capital, Campbellton. Pop. 7,470, of whom 1,687 were slaves. III. A north-eastern county of Tennessee, bordering on Kentucky, drained by several affluents of the Cumberland river, and comprising an area of 450 sq. m. The surface is hilly, and the central part traversed by a ridge of the Cumberland mountains. Large forests occupy a considerable portion of the

land. The productions in 1850 were 227,395 bushels of corn, 48,889 of oats, 46,467 lbs. of butter, and 8,167 of wool. The public schools numbered 650 pupils. Capital, Jacksonborough. Pop. 6,068, of whom 318 were slaves. IV. A northern county of Kentucky, with an area of 120 sq. m. It is situated on the bank of the Ohio, nearly opposite Cincinnati, is bordered on the W. by the Licking river, has an excellent soil, and produced in 1850, 801,125 bushels of corn, 9,988 of wheat, 37,759 of oats, and 23,108 lbs. of tobacco. The surface consists of level bottom lands, and gently undulating tracts of upland. The county was organized in 1794, and named in honor of Col. John Campbell, a former member of the state senate. Capital, Alexandria. Pop. in 1850, 13,127, of whom 177 were slaves.

CAMPBELL, ALEXANDER, founder of the religious sect called "Disciples of Christ," president of Bethany college, Va., born in 1792. He was originally a Presbyterian, but withdrew from that church in 1812, and received baptism by immersion the same year. In connection with his father, Thomas Campbell, he formed several congregations, which united with a Baptist association, but protested against all human creeds as a bond of union, accepting the Bible alone as the rule of faith and practice. He met with much opposition in the assertion of this principle, and in 1827 he was excluded from the fellowship of the Baptist churches. His followers now began to form into a separate body, and in 1833 were supposed to number at least 100,000 souls. They have prevailed especially in the states of Virginia, Tennessee, and Kentucky. In 1841 Mr. Campbell founded Bethany college in Bethany, Va., which has about 150 students. A complete history of the reform to which he was devoted may be found in the "Christian Baptist and Millennial Harbinger," a periodical edited by him in Bethany.

CAMPBELL, ARCHIBALD. See ARGYLE, DUKE OF.

CAMPBELL, ARTHUR, an American colonel, born in 1742, in Augusta co., Va., died in 1816, in Knox co., Ky. Enlisting at 15 as frontier militiaman, he was captured by the Indians around lakes Erie and Michigan, adopted by one of the chiefs, and humanely treated. He escaped after 3 years' captivity, his family having long supposed him dead. At the commencement of the revolution he espoused the American cause, and was successively major, lieutenant-colonel, and colonel in the army. He was elected to the assembly of his native state, and assisted in the framing of her constitution.

CAMPBELL, SIR COLIN, a British general, born in Glasgow in 1791, entered the military service in 1808; served in Portugal and at Walcheren; was wounded on several occasions during the peninsular war; served in the war with the United States, in 1814 and 1815; aided, in 1823, in quelling an insurrection at Demerara; was actively engaged in the Chinese

war of 1842; in the second Punjab campaign, under Lord Gough, in 1845 and 1849, commanded a division of infantry at the battles of Chillianwallah and Goujerat, and at other engagements; was wounded at the former battle; assisted afterward in the pursuit of Dost Mohammed and the occupation of Peshawar; held the command of the troops in that district; undertook, in 1851 and 1852, various successful operations against the turbulent tribes of the adjoining mountain regions; and received, on his return to England, the thanks of the British parliament, and of the East India company, for his services. In 1854, he proceeded to the Crimea, in command of the Highland brigade, which, with the guard, formed the duke of Cambridge's division, which took a conspicuous part in deciding the battle of the Alma, Sept. 16, 1854. At Balaklava, on Oct. 25 following, the Russian cavalry were repulsed by "the thin red line" of his Highlanders. On Sept. 8, 1855, after the unsuccessful attack on the Redan, Sir Colin was ordered by Gen. Simpson to renew the attack, which, however, was rendered unnecessary by the desertion of the works by the Russians. In 1856, after his return to England, he became inspector-general of infantry, and held this office until the end of June, 1867, when, on the death of Gen. Anson, he proceeded to India, at 24 hours' notice, to assume the supreme command in Bengal, arriving at Calcutta Aug. 14, 52 days after the issue of his commission, which bore the date of July 13. Considerable additions to the army having begun to arrive in the course of October, Sir Colin hastened to Lucknow, the seat of the spy rebellion; reached Benares Oct. 31, crossed the Ganges Nov. 11, and arrived at Alambagh on the evening of the 15th. After an encounter with a body of 2,000 rebels, he left one of his regiments in garrison at that place, and resumed his march on the 14th; was received on his approach toward the pleasure ground of Dilkhooga by the fire of the enemy; somewhat, however, in routing them, though not without the loss of some brave officers and soldiers, and advancing against Secunderbagh (a walled enclosure carefully loopholed), a narrow breach was effected, enabling the British forces to make terrible havoc among the rebels, 2,000 of whom were killed. On the following day (Nov. 21), the mosque was taken, the troops bursting into the enclosure round the Motas Mahal (the Pearl Palace), where the rebels made a last stand, and soon a communication was opened with the residency, permitting the late Sir Henry Havelock and Sir James Outram to welcome their deliverers the same afternoon. Sir Colin, however, recognized at once the impossibility of holding Lucknow in the face of the overwhelming masses of the rebels, but making his real design by opening a terrible fire on the Kaiserbagh, he succeeded in dividing the insurgents' attention, and while they were preparing for the anticipated assault, the garrison withdrew during the night of the 23d, through the lines

of pickets. Toward the afternoon of the 24th, Sir Colin reached Alambagh, where, on the following day, he was joined by the rear-guard under Sir James Outram, and hastening on toward Cawnpore, where Havelock had died, arrived at the Pandoo Budgee, within a few miles from thence, on Nov. 26. Sir Colin came in time to save the beleaguered British from destruction. A force of 14,000 sepoy, with numerous cavalry and 40 pieces of artillery, was threatening an army of but 2,000 Europeans under Gen. Windham. Forced to retire within their intrenchments, the British suffered severely from the fierce assault of the rebels, and were almost entirely at their mercy when, alarmed by the long-continued sounds of firing, Sir Colin Campbell crossed the Ganges, and soon drove the rebel force before the intrenchments, capturing 16 of their guns. His first care was to have the women and children and the wounded sent under safe escort to Allahabad, whence they were forwarded to Calcutta; and turning his attention next to the enemy, he commenced the attack in the forenoon of Dec. 9, shelling them out of the town, falling on them with his infantry, and forcing them to take for safety to the Ganges, whence they reached the other side, on their flight into Oude. According to last accounts (August, 1859), Sir Colin was ardently prosecuting the war in Oude, which, however, has assumed more the character of a guerilla warfare, the army organization of the mutineers having been broken.—Sir Colin, not having had aristocratic family influence to assist him in his career, and having entered the service as an ensign in the 9th regiment of foot, attained to the rank of lieutenant-general only in 1856, after his return from the Crimea, and after a whole life incessantly spent in the service. Having previously been made knight-commander of the bath, he was in the same year rewarded with the grand cross of the bath, with 2 Sardinian orders, and the cross of the French legion of honor; and in 1858 he was promoted to the rank of general, and to the peerage under the title of Baron Clyde of Clydehall.

CAMPBELL, GRAMER, a Scotch Presbyterian divine, born Dec. 25, 1719, died April 6, 1796. Left an orphan at the age of 9, he was educated at Marischal college, and apprenticed to the law, but afterward devoted himself to theology. The presbytery of Aberdeen licensed him in 1746; he was ordained to the pastoral charge of a parish near Aberdeen in 1750, presented in 1756 to one of the churches in Aberdeen, elected in 1769 regent of Marischal college, and made doctor of divinity by King's college, and chosen in 1771 professor of divinity in Marischal college. He published in 1763 his "Dissertation on Miracles," in reply to Hume, and his "Philosophy of Rhetoric" in 1776. He also published a translation of the Gospels, which increased his literary and theological reputation. His "Lectures on Ecclesiastical History" were posthumous; they were marked with a violent

feeling of opposition to Episcopacy, and received much censure in the "Anti-Jacobin Review" (1801). On the occasion of his resignation, in 1795, he received a pension of £800 a year from the government.

CAMPBELL, GEORGE W., an American statesman, born in Tennessee about 1768, died Feb. 17, 1848. Commencing his political career in 1803, he served in the U. S. house of representatives till 1809, in the senate from 1811 to 1818, with one year of intermission (1814), during which he was secretary of the treasury. He left the senate in 1818 to become minister plenipotentiary and envoy extraordinary to Russia.

CAMPBELL, JOHN, a political and historical writer, born in Edinburgh, March 8, 1708, died Dec. 28, 1775. He was intended for the law, but became a writer in the varied departments of biography, history, politics, and statistics. Commencing at the age of 28, his literary career ended only with his life. His first publications were anonymous, and appeared in the following order: "The Military History of Prince Eugene and the Duke of Marlborough" (1736), 2 vols.; his contributions to the "Universal History" (1787-'89); "Travels and Adventures of Edward Brown, Esq." (1739), and "Concise History of Spanish America" (1741). In 1742 he began to put his name to his works; the first was the "Lives of the English Admirals," &c. This work was enlarged from 2 to 4 volumes in 1744, and was swelled to 8 by succeeding authors. In 1745 he began his contributions to the *Biographia Britannica*. In 1750 he published his "Survey of the Present State of Europe," a work which met with considerable success. After the peace of Paris, 1763, he was employed by the British government to write a vindication of it. His last work, "A Political Survey of Great Britain," was pronounced to come altogether short of the expectation raised by its title. In 1755 he was appointed his majesty's agent for the province of Georgia, which office he retained until his death.

CAMPBELL, THE REV. JOHN, a dissenting minister, born in Edinburgh, in 1766, died April 4, 1840. He was apprenticed by his father to a goldsmith and jeweller in Edinburgh, but when about 28 years old he began to give himself to the ministry. His Christian labors and spirit seemed from the beginning to have had a missionary turn. Among his first enterprises was that of undertaking the charge of 24 young Africans who had been brought from Sierra Leone to be instructed in Christianity. He took also an active part in the formation of the British and foreign Bible society in 1804. He was ordained the same year pastor of the Kingsland dissenting church, near London. In 1812 he made a journey to South Africa, to inquire into the religious state of the natives, and the prosperity of the missions among them, and repeated the visit in 1818. On his return, each time, he published an account of his travels and observations. In 1828 he founded the mag-

azine called the "Teacher's Offering," having previously established the "Youth's Magazine," which he edited for 18 years. He also wrote several other works.

CAMPBELL, JOHN, lord, chief justice of the English court of queen's bench, born Sept. 15, 1781, at Springfield, a village near Cupar, Fifeshire, Scotland. His father, the Rev. Dr. George Campbell, was minister for 64 years at Cupar. John was the 2d son, and was educated at the Scottish university of St. Andrew's. He migrated early in life to London, entered as a student at Lincoln's Inn (1800), and was called to the bar in 1806. While pursuing his legal studies, he supported himself by writing law reports, and theatrical criticisms for the London "Morning Chronicle." His industry and talents soon brought him a good practice at the common law bar; nevertheless he found time to publish reports of the principal cases decided in the courts of king's bench and common pleas. In 1821 he married Mary Elizabeth, the eldest daughter of Sir James Scarlett, afterward the first Lord Abinger.—Though he won a prominent place among advocates, yet, as a serviceable member of the whig party, his politics were ungrateful to Lord Eldon, and it was not till 1827 that he received the appointment of king's counsel. In 1830 he was elected M. P. for the borough of Stafford, and in 1833 for Dudley. In November of the latter year he was appointed solicitor-general by the Grey ministry, which office he retained until Feb. 1834, when he was elevated to the rank of attorney-general. He left office with the Grey ministry in Nov. 1834, and at the ensuing general election was returned by the city of Edinburgh, which he continued to represent until his elevation to the peerage. After the resignation of Sir Robert Peel's ministry in 1835, Sir John Campbell regained the attorney-generalship, and remained in possession of it until June, 1841. In the mean time his wife had been raised to the peerage with the title of Baroness Stratheden. In June, 1841, he was appointed lord chancellor of Ireland, and raised to the peerage as Baron Campbell. On the resignation of the Melbourne administration he lost his recently acquired office, Sept. 1841. From this period until 1846, his public life was confined to hearing appeals in the house of lords, and on the judicial committee of the privy council, and acting as one of the leaders of the opposition in the upper house. The leisure that thus fell to him was devoted to literary pursuits, the fruits of which were presented to the world in 1846, in the shape of the "Lives of the Lord Chancellors and Keepers of the Great Seal of England, from the earliest times to the reign of George IV.," in 7 volumes, London, 1846-'47; republished in Philadelphia. The return of the liberal party to power in 1846 gave him the post of chancellor of the duchy of Lancaster, and a seat in the Russell cabinet. In 1849 he published in 2 volumes, "The Lives of the Chief Justices of England,

from the Norman Conquest to the death of Lord Mansfield." A 3d volume, continuing the series down to the death of Chief Justice Tenterden in 1839, appeared in 1837. On the retirement of Lord Dunsan from the chief justiceship of the queen's bench in March, 1850, Lord Campbell, notwithstanding his great age, accepted that laborious appointment, the duties of which he has discharged and continues to discharge with unflagging industry, up to the present time (1865), together with those attaching to a legal poet in appeal cases, and to a whig leader. Lord Campbell took advantage of the recent great changes in the landed proprietary of Ireland to become a large landowner in the province of Connaught. His intellectual powers are very clear and robust; his manners so plain and even plebeian, as to acquire for him the by-name of "plain Jack Campbell," and his capacity for labor, always immense, is but slowly impaired by the increasing weight of years. He has 2 daughters and 4 sons, the Hon. William Frederic, born Oct. 15, 1824, being the eldest son. His speeches at the bar and in the house of commons have been collected and published (1857).

CAMPBELL, Sir Sam, a British officer, born about 1770, died in Sierra Leone, Aug. 14, 1837. After serving during several campaigns in the West Indies, he was, in 1811, appointed colonel in a regiment of Portuguese infantry, and took part in the blockade of Almeida, the siege of Badajoz, and the battle of Salamanca. He was subsequently attached to the Russian army to report upon its force and military operations, in which capacity he served till the entry into Paris in 1814. He was appointed by the British government to accompany Napoleon from Fontainebleau to Elba, and during one of his occasional excursions from the island to the adjoining parts of Italy, Napoleon effected his escape. Yet the British ministry did not charge him with lack of vigilance. He subsequently negotiated with Prince Caraccioli the conditions of the capitulation of Naples to the Anglo-Sicilian forces, and served under the duke of Wellington in Flanders till the 2d entry into Paris. In 1815 he was sent to explore the course of the Niger and to continue the discoveries of Mungo Park. His death was caused by the malarial climate of Sierra Leone, of which place he was appointed governor-general in 1826.

CAMPBELL, SAMUEL, an American officer, born in New Hampshire in 1738, died Sept. 12, 1804. He removed in early life with his father to Cherry Valley, N. Y., where many of his descendants still reside. He took a conspicuous part in the French war, and also in the revolution. He distinguished himself at the battle of Oriskany, under Gen. Herkimer. In 1776, when Cherry Valley was destroyed by Butler and Brent, Campbell shared in the pecuniary losses of the occasion, and himself and entire family, except his eldest son, were taken captives. After the conclusion of the war, he was faithful

to his republican principles, and was a member of the state legislature.

CAMPBELL, THOMAS, a British poet, born in Glasgow, Scotland, July 27, 1777, died in Boulogne, France, June 15, 1844. His father was a cadet of the clan of Campbells in Kintyre, illustrious from the times of Wallace and Bruce. At the age of 13, already an accomplished scholar in Latin and Greek, he entered the university of Glasgow, where he remained for 3 years, partially supporting himself by private teaching. He was a devoted student, excelled particularly in Greek, and Prof. Young used to advert with delight to his poetical translations of the Greek tragedians as the best that any pupil in the university had ever produced. Among his companions he was known also as a wit and satirist, and his alternations from joyousness to extreme pensiveness culled their sympathy and love. On leaving the university he spent a year among the mountains of Argyleshire, amid the wild magnificent scenery which had been the home of his feudal ancestors, where he composed several poems, among which was "Love and Madness," which gave him a local celebrity. From early boyhood he had written verses, and cultivated almost exclusively his taste and imaginative faculty, and he could not now bring himself to adopt any profession. His mind, formed by classical impressions, contemplated with wonder the whirl of innovation and experiment, the wars and philanthropic ideas of the French revolution, and with an enthusiasm for liberty, which he at that time shared with most youthful minds, he went to Edinburgh to devote himself to literature as a profession. He negotiated with publishers, instructed pupils, was not unknown to Jeffrey, Horner, Brougham, and other young men who were about to launch the "Edinburgh Review," but was chiefly interested and employed in composing the beautiful episodes of the "Pleasures of Hope." This poem was published in 1799, and achieved a success unparalleled, perhaps, by a first effort, in the annals of literature. It captivated all readers by its melodious and polished diction, and by its eloquent utterance of the prevailing generous sentiments of the time, and introduced the author at once to fame and society. He thus obtained the means to visit the continent, studied Greek several months at Göttingen under Heyne, witnessed from the monastery of St. Jacob the battle of Hohenlinden, which he has described in his letters, and in one of the grandest of his poems, and after making brief and irregular rambles, controlled by the exigencies of war, being checked in his attempt to pass into Italy, and chased into Yarmouth by a Danish privateer, repaired in 1801 to London. He soon after directed his course to Edinburgh by sea, and was surprised to learn from the passengers that the author of the "Pleasures of Hope" had been arrested in London for high treason, was confined in the tower, and expected to be executed. In fact, so suspicious was the British govern-

ment at that time, that it had amplified his association with French officers abroad into a plot, and a warrant was issued for his apprehension as a spy. It was with difficulty that the poet, on arriving at Edinburgh, could satisfy the authorities of his loyalty. During his travels he had composed a few short pieces, among which were his "Exile of Erin," "Lochiel's Warning," and "Ye Mariners of England," but now obtained his livelihood only by fugitive articles for the newspapers and booksellers. A poet by choice, but a prose author from necessity, he removed in 1803 to London, and soon after to Sydenham, where for 17 years he devoted himself to fulfilling contracts with publishers, and to composing, in the intermissions of daily toil, the few poems which confirmed and increased the reputation which his first work had procured him. He had a wife, mother, and sisters dependent on him, and amid alternate seasons of energy and lassitude, hope and despondency, composed an elaborate historical notice of Great Britain for the "Edinburgh Encyclopædia," a "History of the Reign of George III.," frequent contributions to the "Star" newspaper, and collected materials for his "Specimens of the British Poets." Upon the accession of the whigs to power in 1806, he received a pension of £200, and in 1809 published his second great poem, "Gertrude of Wyoming," to which were attached several of his finished and powerful lyrics. In 1812 he lectured on poetry at the royal institution to an illustrious audience, whose approbation he won; in 1814 he visited Paris in company with Mrs. Siddons, where nothing delighted him so much as the masterpieces of ancient art in the Louvre; in 1818 travelled in Germany, and associated with Arndt, the Schlegels, and Humboldt; and on his return to England assumed, on liberal terms, the editorship of Colburn's "New Monthly Magazine," which he retained for 10 years. His poetical labors from this time, with the exception of the "Last Man," which is one of the happiest of his productions, are of little importance. The author of the finest lyrics and perhaps the best didactic poem in the language produced, during his later years, only one or two passages which approached in gracefulness and vigor to his earlier achievements. His "Theodric," published in 1824, was pronounced inferior to his former poems, and his "Pilgrim of Glencoe," which appeared in 1842, was deemed a failure. He was now also interested in other pursuits. He started the project of the London university, which, chiefly through his exertions, was at length successfully established; he was chosen in 1826 lord rector of the university of Glasgow, to which office he was twice reelected; he was severely stricken in 1831 by the capture of Warsaw, and the total defeat of the Poles, the objects of his youthful enthusiasm; and domestic calamities came to complete his desolation. "My wife is dead, my son is mad, and my harp unstrung," was the account which he gave of

himself, and, with his delicate constitution broken, he found himself a prematurely old man, alone in the world. Yet he remained busy to the last, composed biographies of Mrs. Siddons and of Petrarch, travelled in Algeria and wrote pleasant poetical sketches of that country, visited Germany again, and in 1843, from the double motive of health and economy, removed to Boulogne, which he resolved to make his future residence. There he died, after a lingering sickness, solaced by the gentle guardianship of his niece and of his friend and biographer, Dr. Beattie. His poems have retained all their original popularity amid every fluctuation of taste. Though he chastened his style to simplicity with laborious care, and polished his verses till they accorded with a fastidious and Greek taste, yet most of his lyrics and many portions of his two longest poems appeal to the popular mind and feeling, and are treasured in the memory like primitive songs and ballads.

CAMPBELL, LORD WILLIAM, the last of the royal governors of South Carolina, died in 1778. He was the 3d brother of the duke of Argyle, and married a wealthy Carolina lady of the Izard family. He was active in fomenting insurrectionary movements favorable to the crown among the border population and the red men. Detected in this practice, he was expelled from the country by the patriots, and took refuge on board a British man-of-war. In this vessel he threatened the city of Charleston, but the guns of Fort Johnson forced him to retreat. He joined the expedition under Sir Peter Parker against the province, and in the attack on Charleston in 1776 received the wound of which he died.

CAMPBELL, WILLIAM, an officer in the American revolution, born in Augusta, Va., 1745, killed at the battle of Eutaw Springs, S. C., Sept. 8, 1781. He held a captain's commission in the Virginia line, among the earliest troops raised in that state. In 1778 he was promoted to the rank of lieutenant-colonel of the Washington county militia, and soon after to that of colonel. After the battles of King's mountain and of Guilford, in both of which he greatly distinguished himself, he was promoted by the Virginia legislature to the rank of brigadier-general. He led the Virginia troops at the battle of Eutaw, and fell in the shock of the charge with the bayonet. In his dying moments he was told of the defeat of the enemy, and is said to have uttered the celebrated ejaculation of Gen. Wolfe, "I die contented."

CAMPBELLTOWN, a district of Van Diemen's Land, with a settlement of the same name on an affluent of the Macquarrie.

CAMPE, JOACHIM HENRICH, a German author and publisher, born at Deensen in 1746, died in Brunswick, Oct. 22, 1818. He studied theology at Helmstadt and at Halle, and in 1773 was appointed chaplain in the Prussian army; but, moved at the spectacle of human suffering, he turned his mind to the education of youth as the source whence would result the great-

at amelioration of the conditions of life. He succeeded Haselow as principal of the Philanthropium educational establishment at Dessau, but soon resigned this position and founded a private school at Haselburg. In 1783, feeble health obliged him to live for a time in repose, but in 1787 he was chosen by the government of Brunswick to superintend and reform the schools of that duchy. He became the head of a publishing house there, which issued his numerous works, was afterward conducted by Campe's son-in-law, Mr. Vieweg, and which continues to enjoy a high reputation in Germany under the firm of *Friedrich Vieweg und Söhne*. Campe published a German dictionary, and other works calculated to improve the language. While at Paris in 1789, he published letters in favor of the revolution which attracted much attention. His reputation, however, rests upon his numerous books of travels, and other books of instruction for the young. The immense popularity of his writings may be gathered from the fact that a 57th edition of his *Rechnen der Jüngere*, of which translations were made into almost all European languages, was published in 1856, and a 19th edition of his "Discovery of America" in 1853.—Arceve, a nephew of the preceding, born in 1773, died in 1866, became a partner of the famous Hanberg publishing house, under the firm of Hoffmann and Campe, having married the daughter of Hoffmann.—Financius, born in 1777, died in 1846, was for some time a member in the firm of his brother August, founded the museum for literature and art in Hamburg, established in 1809 a house in Nuremberg, wrote a book on Albert Dürer and a painters' dictionary, officiated as a magistrate, and was one of the founders of the orphan asylum in the same city, and was the first in 1825 to propose the establishment of the publishers' association of Leipzig, of which he became the first president.—Jouire, a brother of the preceding, born about 1792, spent the early part of his life in fighting against the French, and assumed in 1825 the conduct of the publishing house of Hoffmann and Campe, of Hamburg, his brother August having then withdrawn from the firm. Julius Campe was a personal friend of Heine and Börne, and, as the publisher of their works, became involved in difficulties with the government, which took objections against the circulation of some of Börne's writings. In 1845 some of the works which came from Campe's press were stopped by the authorities, and again in 1856 he subjected himself to arrest and to the payment of a fine by bringing out Veine's history of the German courts.

CAMPEACHY, the principal seaport town of Yucatan in Mexico, on the W. coast of the peninsula, in lat. 19° 50' N. and long. 90° 28' W.; pop. about 15,000. It is entirely surrounded by mountains and is enclosed by 4 bastioned walls. Its harbor has a pier 50 yards in length, but on account of the shallowness of the water only the lighter vessels can pass within it, the

others being obliged to anchor outside. The coast is ill supplied with water, and the inhabitants are often obliged to bring it from long distances. Agues prevail during the rainy season, but at other times the climate is healthy, and the heat mollified by the land breeze in the morning and the sea breeze in the evening. The markets are generally well supplied, but the prices of food are much higher than in other parts of the state. The streets are narrow, crooked, ill-paved, and dirty. The private houses, which are seldom of more than 1 story, are built altogether of calcareous stone. The public edifices are constructed of the same material, but are generally 2 stories high, and are painted and ornamented. The windows are unglazed. The alameda or public walk, is a pleasant promenade, lined with double rows of orange-trees, and furnished with seats. There is a museum containing a fine collection of shells and other objects of natural history, beside many antiquities of Yucatan. It was founded by 2 monks, the brothers Canache. Campeachy has 2 fine churches, several convents, a hospital, college, and theatre; but its entire importance is due to its trade in logwood or Campeachy wood, the *hematerylon Campeachyanum*, which is found nowhere else in such abundance and perfection. It is exported in logs, which are afterward clipped and used for dyeing. The principal place for cutting it is on the banks of the Rio Champoton, south of the town, and the wood here obtained is sent in large quantities to London, where it commands a higher price than that brought from any other part of the West Indies. Cotton is exported to some extent. Wax is procured in considerable quantities from the wild, stingless bees which abound in the vicinity. The other products are marble, salt, rice, and sugar. No manufacture of any note is carried on except that of cigars. In spite of the shallowness of the harbor, there are ship-building yards in which vessels with 100 feet of keel are constructed, but they can only be floated out by means of mechanical contrivances. Underneath the town are subterranean caverns, constructed by the ancient Mayas, and in the neighborhood many interesting ruins.—Campeachy was founded in 1540, and has suffered many reverses. It was sacked by the English in 1659, and nearly destroyed by pirates in 1679 and 1685. It was the centre of hostilities in the insurrection of Yucatan against Mexico in 1842, and successfully resisted a series of attacks by land and sea.

CAMPEGGIO, *Ludovicus*, an Italian cardinal, born in Bologna in 1474, died in Rome, July 19, 1529. He was educated for the law, married very young, and upon the death of his wife took holy orders. He was appointed by Leo X. to the government of Parma, and was despatched to Germany to combat the progress of Luther. Upon his return he was made cardinal, and was soon after sent to England to induce that country to join the confederation against the Turks.

His mission failed in its main object, but he was made by Henry VIII. bishop of Salisbury. On his return he was again sent as legate to the diet of Nuremberg, accredited with full but fruitless powers to check or uproot Lutheranism. When Henry VIII. determined upon a divorce from his wife Catharine of Aragon, Cardinal Campeggio was again sent to England to hold a legatine court, in connection with Cardinal Wolsey, in which to judge the matter. The appeal of the queen to the pope caused Campeggio to return to Italy, where he assisted at the crowning of Charles V. at Bologna, and upon the death of Pope Clement VII. used his influence successfully in the conclave for the election of Alexander Farnese. Campeggio was the friend of Erasmus, Sadoleto, and other learned men of his time; but of his numerous writings only a collection of letters has been published.

CAMPENON, FRANÇOIS NICOLAS VINCENT, a French poet, born in Guadeloupe, March 29, 1772, died Nov. 24, 1843, at Villeneuve-sur-Corbeil, near Paris. During the early events of the revolution he composed a romance in praise of Marie Antoinette, and was compelled to flee to Switzerland; he published in 1795 a fanciful account, in prose and verse, of his journey. After his return to Paris, he published in 1800 his *Épître aux femmes*, and soon afterward a didactic poem entitled *La maison des champs*. Two years later appeared his *Enfant prodigue*, which had an immense success, and occasioned his nomination and election to the institute of Paris, to succeed Delille.

CAMPER, PIETER, a Dutch physician and anatomist, born in Leyden, May 11, 1722, died at the Hague, April 7, 1789. The son of a wealthy and refined man, who was on intimate terms with Boerhaave and other eminent persons, he was early encouraged in his studious habits, and applied himself diligently and with much success to different branches of literature and art. He had acquired at the age of 20 considerable skill in the art of drawing. He was instructed in drawing by Moor, and in geometry by Labordes. On entering the university of Leyden he devoted himself with assiduity to the study of medicine. In 1746 he received his degree of doctor of medicine. Two years later, having lost his parents, he travelled through England, France, and Switzerland, visiting museums and collections of art, making the acquaintance of eminent men in all departments of learning, and competing for the prizes offered by academic and scientific bodies in large cities. In England he remained about a year, during which time he became acquainted with many of the eminent men of science and institutions of that country. During his absence from home, in 1749, he was appointed professor of philosophy, medicine, and surgery at Franeker. In 1753 he was named professor of anatomy and surgery at the atheneum of Amsterdam. In 1758 he was appointed to the chair of medicine in the same establishment. In 1761 he resigned these functions to pursue his studies more at

leisure, while residing in the house of Klein Lankum, near Franeker; and during this time he was elected a member of the assembly of the states of the province of Friesland. Two years later he resumed his professional career, and was appointed to the chair of medicine, surgery, anatomy, and botany at the university of Groningen. In 1778 he resigned this chair, and some time after he was named a member of the state council of the united provinces; which dignity he held at the time of the memorable events of 1786. He was attached to the party of the stadthouder; but the political measures of the victorious party gave him much displeasure and depressed his spirits. He fell into a state of melancholy which precipitated his death. No man had more success than Camper during his own lifetime. In 1772 he obtained a prize from the academy of sciences of Paris, and an "accessit" in 1776; a prize from the academy of Dijon in 1779; from that of Lyons in 1778, and that of Toulouse in 1774. He also obtained prizes from the societies of Haarlem and Edinburgh, and the academy of surgery. He was a member of the academies of Berlin and St. Petersburg, and of the societies of London and Göttingen. In 1785 he was elected foreign associate of the academy of sciences of Paris, he and the celebrated Boerhaave being the only Hollanders who had obtained that honor. In 1761 Camper discovered and described the organs of hearing in fishes, which had only been superficially and incorrectly indicated by Geoffroy. In 1771 he discovered that the hollow bones of birds were in direct communication with the respiratory organs. Gabbé had already observed that these bones in birds contained no marrow, and he surmised that this peculiarity was a condition of stability; but Camper showed that the air of the lungs, penetrating into these cavities of the bones, subserved a special purpose in rendering the body specifically lighter as a means of rising in the air, and enabling the bird to fly. In 1774 John Hunter made the same observation, and described this peculiarity in the anatomy of birds; and hence many English anatomists ascribe the discovery to him, which really belongs to Camper. Camper was the first to show that the ancient anatomical descriptions of the ape apply to a species of orang-outang. He was one of the earliest ethnological students who have attempted to illustrate the varieties of the human race. His dissertation on this subject makes the shape of the skull the basis of classification; and, though more recent inquiries have thrown fresh light on the science, his views have the merit of being not only original, but ingenious and acute. In his work on the natural differences of features in persons of various countries and ages, he explains the characteristic form and expression of countenance from the facial angle. He was the first who gave a correct description of the osteology of the rhinoceros, the dugong, and many other animals of different types belonging to living and

reflect species; giving an impetus to the study of comparative anatomy, which has since become a science of so much importance. He pointed out the astonishing analogies which link together the whole chain of vertebrated animals, man, apes, quadrupeds, birds, reptiles, and fishes, showing how easily, as he observes himself, "the type of a cow may be metamorphosed into that of a bird, and the form of a quadruped into that of a man."—None of his works are voluminous, but they are exceedingly numerous. Of his *Demonstrations Anatomico-pathologicae* only 2 parts appeared, the one containing the structure and diseases of the human arm, the other the structure and diseases of the pelvis. He published separate and very interesting dissertations on several medical topics, together with a series of memoirs for different learned societies. Among the principal of these are essays on inoculation for small-pox; on the origin and color of negroes; on the signs of life and death in new-born infants; on infanticide, with a project for the establishment of a foundling hospital; on the causes of infanticide and suicide; on the intromission of air into the lungs of new-born children; on the operation of lithotomy, at 2 different times, according to the celebrated Franco (*l. c.* on the first day the surgeon makes the incision into the bladder, the patient is then put to bed, and the extraction of the stone is deferred to the 21, 3d, or 4th day), &c.—In 1803 a collection of his works was published at Paris, in 3 vols. 8vo. with a folio atlas of plates.

CAMPERDUIN, a seacoast village of the Netherlands, in North Holland, 37 miles N. W. of Amsterdam, celebrated for the naval victory gained here, Oct. 11, 1797, by the English fleet under Admiral Duncan, over the Dutch commanded by De Winter. This victory gave to the conqueror the title of viscount of Camperdown.

CAMPFAUSEN, LUDWIG, a Prussian statesman, born Jan. 3, 1833, at Hünshoven, near Aix la Chapelle; established himself as a banker in Cologne in 1853, in partnership with his brother; put himself at the head of railway enterprises in Prussia; advocated the principles of free trade; in 1859 was made president of the Cologne chamber of commerce; established in 1841 the Cologne steaming company, and was in the same year sent as representative to the diet of the Rhenish provinces, where he became conspicuous. He was a member of the united diet of 1847, and of the Ständesausschuss of 1848. On March 29, 1848, he became prime minister of Prussia, but relinquished his office on June 30 of the same year. He refused to accept the speakership of the Prussian national assembly which was tendered to him, and also refused the overtures made to him by the visor of the German empire; but accepted the office of Prussian ambassador near the Frankfurt parliament, in which capacity he opposed all measures calculated to impair the preponderance which he claimed for Prussia in the councils of Germany. On Jan. 23, 1849, he proposed the

formation of a national league, the principal object of which was to Prussiaize Germany. But when, in April, the accession of Count Brühlensburg to the helm of affairs proclaimed the supremacy of the military element in Prussia, Camphausen again tendered his resignation. In his subsequent political career in the Prussian assemblies and Erfurt parliament, he remained faithful to constitutional principles, and when the conferences of Warsaw and Olmutz, in 1851, made it evident that no effort of his could stay the reactionary policy which had resumed its sway in Prussia, he withdrew from politics, and returned to his office in Cologne, where, under the firm of A. and L. Camphausen, he continues in the banking business.—WILHELM, a painter of battle pieces of the school of Düsseldorf, where he was born Feb. 5, 1818. In order to familiarise himself with the characteristics of battlefields he served for some time as a volunteer in the army, and his first productions, "Tilly at Breitenfeld," and "Prince Eugene at Belgrade," were successful with the public. On his return to Düsseldorf, he painted "Godfrey de Bouillon at Ascalon," "Partisans watching the enemy," "A Convoy of Prisoners of Cromwell's Camp," now in the gallery of Louis I. of Bavaria, "Storming of an English Castle by the Soldiers of Cromwell," "Charles II. on his Flight from the Battle of Worcester," &c. One of Camphausen's more recent works is "Charles I. at Nasauy."

CAMPHERENE, CAMPHORUS (Gr. *καμφορος*, camphor, *γύμνη*, to produce). These substances, identical in composition, are obtained—the former by rectifying crude spirits or oil of turpentine, by distilling it over chloride of calcium to separate the water that may be present—the latter by decomposing camphor, by distilling it with anhydrous phosphoric acid. Its composition is 10 equivalents of carbon and 8 of hydrogen, $C_{10}H_8$. Camphor is its protoxide, and is produced by its union with one equivalent of oxygen. This pure oil of turpentine has been much used for purposes of illumination, and lamps called camphora lamps have been contrived to lessen somewhat the dangers attending the employment of so explosive a substance. It requires for its complete combustion a large supply of air, and when furnished with this under proper conditions in other respects, it gives a brilliant flame, more pleasing to the eye, and more perfectly exhibiting the colors of objects as seen by the light of the sun, than that afforded by the ordinary illuminating agents. If burned in an unsuitable lamp, a considerable portion of the carbon escapes uncombusted, filling the air with sooty flakes. Camphene is a remarkably thin fluid, and is rapidly taken up in the wick by capillary attraction. From its property of combining with the oxygen of air, *sensum* to the essential oils, it is apt to soon deteriorate and become of a gummy consistence; for this reason it should be used freshly made. See BENZENE FLUOR.

CAMPHOR, the name given to different con-

crete volatile products commonly obtained by distillation from the chipped wood, roots, and leaves of certain aromatic plants, and condensed by sublimation into a solid form. As known in commerce, camphor is procured only from Japan and the islands of Formosa, Sumatra, and Borneo; but one species of the trees which produce it is said to abound in some parts of China. In Sumatra and Borneo the product is limited to a narrow range of latitude between the equator and lat. 3° N. Two kinds are known in commerce. The consumption of one of these, however, is monopolized by the Chinese, who, by a mere whim, set a value upon it from 70 to 100 times the price of the other variety. The kind they so highly esteem is the Malay article, the product of a gigantic tree which grows wild on the slopes of the Diru mountains, in Sumatra, and in the territories of the sultanate of Brunai, in Borneo—a tree which attains a height of more than 100 feet, and a diameter of 6 or 7 feet. Siebold describes one which measured 50 feet in circumference. It is known in botanical works as the *dryobalanops camphora* or *aromatica*. The camphor is obtained from this tree without employing the process of separation required in procuring the other variety. It is found in concrete masses secreted in longitudinal fissures and crevices in the heart wood, and is extracted by splitting the trunk in pieces and picking out the lumps with a pointed instrument or the nail, when they are small. Some lumps have been found as large as a man's arm, but the product of a large tree does not often reach 20 lbs.; half this amount is a good yield for a middling-sized tree, and in hunting for one many are felled and split up with great labor that furnish no camphor; hence the high price of the article. The Chinese, it is said, pay for it at the rate of \$1,000 to \$1,200 the picul (133 lbs.); or, for a very superior quality, even \$3,000 for 1 cwt., while the Japan article obtained in their ports, and hence known as Chinese camphor, is worth only from \$.12 to \$.15 the picul. The camphorwood trunks are supposed to be made of the wood of this tree. It answers well for house and ship timbers and articles of furniture, especially such as are intended to contain and preserve clothes. It is very easy to work, splits readily, and is never attacked by the many destructive insects in the East, which will so speedily devour any European woods, and even those of the East, except the teak, the calambuco, and the camphor. The young trees produce, instead of the full-formed camphor, a straw-colored fluid, which is called in the East Indies the oil of camphor, and is used as an external application in rheumatic complaints. This is supposed by Dr. Thompson to be the same substance as the solid product, the composition of which he represents by the formula $C_{14}H_{10}O$. But the genuine oil of camphor he describes as the product of the same trees which furnish the camphor of European commerce. This is known in this country and Europe as the camphor of Japan or common

camphor; and of this two varieties are recognized in commerce: one, the Dutch, Japan, or tub camphor; and the other, the Chinese, or Formosa camphor. The latter is principally produced in the island of Formosa, and thence carried in junks to Canton. There it is packed in square chests lined with lead, and distributed to the various eastern ports at which we obtain it. It is a crude article in dirty gray grains, agglutinated together in lumps, and contaminated with many impurities. The tub camphor is obtained in Batavia, whence it is exported in tubs securely covered with matting, and an outside tub, and containing 100 lbs. or more of the article. This is in pinkish colored grains, coarser and purer in general than the Chinese. Both varieties are probably obtained from the same tree, the *laurus camphora* of Linnæus, or *camphora officinarum* of Nees von Esenbeck—an evergreen of considerable size, resembling the linden tree, and bearing a red berry like that of the cinnamon. All parts of the plant possess the odor of camphor, and produce this article when cut into small pieces and distilled. The process is conducted in large kettles of iron, which are furnished with covers in the form of a dome, in which stalks of rice or grain are placed for receiving the camphor sublimations. But little water is used, and only a moderate heat applied to volatilize this and the camphor together. The latter condenses upon the straw.—All the camphor of commerce is a crude article, which requires purification before it is fit for use. The art of refining it was long monopolized in Europe by the Venetians, and afterward by the Dutch; and it is not long that we have in this country been independent of the latter for our supplies of the pure material. The crude article is introduced together with about 1-50th the quantity of quicklime into vessels of cast iron, which serve as retorts, and over which are placed covers of sheet iron connected with the lower vessels by a small aperture. A number of these stills are placed in a large sand bath, and, after the melting of the camphor within them, kept at a uniform temperature, that the process may go on quietly. The quicklime serves to retain the moisture, which would otherwise interfere with the condensation of the pure camphor. This takes place under the shelf upon which the cone stands, the vapor when in excess passing into the loosely affixed cones of sheet iron, care being taken to keep the hole open. The deposit of camphor is in the form of a circular cake an inch or two thick, with a hole through the centre.—The composition of camphor is represented by the formula $C_{10}H_{16}O$. Its specific gravity is 0.987; its melting point is 288° F.; and it boils at 400° . It is a semi-transparent white substance, crystallizing in hexagonal plates, and with a crystalline fracture; soft, friable, and tough, so that it is difficult to reduce it to powder. When moistened with a few drops of alcohol, it is easily pulverized. Its taste is somewhat bitter and pun-

gent, attended with a slight feeling of coldness; its odor is strong and fragrant, highly penetrating, and exceedingly noxious to troublesome insects. Exposed to the air, it soon disappears in vapor; in glass vessels it sublimes and crystallizes upon the parts most exposed to the light. It is readily inflamed, and burns with much smoke and light. A singular effect is noticed on dropping small pieces of clean camphor upon the surface of pure water. The particles rotate and move rapidly about, sometimes for several hours. Any greasy matter touching the water will at once put a stop to the motions. Mr. Tomlinson states that he has found the same phenomenon in the raspings of cork steeped in sulphuric ether, in sublimated benzoic acid, potassium, &c. Camphor is readily dissolved in alcohol, this taking up about its own weight of it. One hundred parts, indeed, of sp. gr. 0.896, dissolve 120 of camphor, forming the camphorated spirit of the pharmacopoeia. Water, added to the solution, precipitates the camphor in fine powder. It is soluble in water only to the extent of about 1 part in 1,000. Chloroform is a powerful solvent of it.—In medicine camphor is made use of internally and externally. In large doses it acts as a poison, producing convulsions, stupor, and death. A case is reported of a young child being fatally poisoned by only 10 grains. Its action is principally upon the brain and nervous system. Through the brain it is supposed to act upon the circulation, producing in moderate doses mental exhilaration, and in larger doses giddiness and a disposition to sleep. Properly administered, it is a sedative, quieting nervous excitement. It particularly promotes the healthy action of the skin, when this is dry and hot in typhoid diseases. Externally applied, it proves highly beneficial in cases of headache and other severe pains from its anodyne properties. Dissolved in olive oil, or as recently proposed in chloroform, it forms an excellent liniment.

CAMPHORIC ACID. When camphor is decomposed by the action of strong nitric acid and several times distilled, an acid is obtained of the above name, in fine transparent plates or needles, the composition of which is represented by the formula, $C_7H_5O_4 + HO$.

CAMPHUYSEN, DIJK RAFFELER, a Dutch painter, theologian, and poet, born at Gerken in 1586, died at Dokkum in 1626. He lost his parents at an early age, and was left to the care of an older brother; who, thinking that he observed in Raffeler an inclination for painting, placed him as a pupil in the studio of an artist. He soon distinguished himself by his landscapes, which were generally of small size, but animated with bus, cattle, and human figures, and executed with a skill and delicacy to which no former Dutch painter had attained. His paintings are now very rare, for at 16 years of age he abandoned the art to devote himself to theology, which was the reigning passion of the age. He embraced the doctrines of Arminius, and shared in the persecutions under which

Arminianism then suffered. He was expelled from the curacy of Vleuten which he had previously obtained, because a fugitive from village to village, a prey to suffering and privation, and often regretting the canvas and brush which had erewhile opened to him so pleasant a career. He found now in writing short poems his only relief and consolation. These are generally upon religious subjects, and are characterized by a remarkable depth of feeling.

CAMPIAN, EDWARD, an English author and theologian, born in London in 1640, died Dec. 1, 1691. He studied at Oxford, and was ordained a deacon in the English church. When Queen Elizabeth visited Oxford in 1666, he was selected to make the oration before her, as formerly while at school he had been chosen to deliver an oration before Queen Mary on her accession. He went from college to Ireland, and while there wrote the history of that country, and connected himself with the Roman Catholic church. His enthusiasm leading him to seek to make proselytes to his new faith, he was seized and imprisoned; but after a short time effected his escape to the Low Countries, and soon after joined the English colleges of Jesuits at Douay, passed his novitiate as a member of that society, and became distinguished for his piety and learning. At Rome, in 1678, he was admitted a member of the order of Jesuits, after which he resided for a time at Vienna, where he composed a tragedy, which was received with much applause and acted before the emperor; and at Prague, where he taught rhetoric and philosophy for 3 years. Afterward he was sent by Gregory XIII. in company with Father Parsons on a mission to England, where, on his arrival at the beginning of 1681, he challenged the universities and clergy to dispute with him. His efforts were followed by an large number of conversions as to disquiet the ministry of Elizabeth; and at the instance of Walsingham he was arrested and thrown into the tower upon charge of having excited the people to rebellion, and of holding treasonable correspondence with foreign powers; he was tried, found guilty, condemned to death for high treason, and executed at Tyburn. The insults of the populace attended him to the tower, where torture was fruitlessly applied to extort from him a confession of treason or a recognition of the supremacy of the English church, and after his death a fragment of his body was sent to each of the principal towns for exposure. Beside his history of Ireland, he compiled a "Universal Chronology," and collections of his letters and several essays were published after his death.

CAMPINE (Dutch, *Kempene*, or *Kempenland*), an extensive arid and sandy tract, forming a part of the provinces of Antwerp and Limburg, a part of Brabant, and a part of Holland. Great efforts have been made to reclaim it, but with only partial success. About 300,000 acres remain useless.

CAMPLI, a town in the province of Abruzzo Ultra, Naples, is the see of a bishop, and con-

tains a cathedral, an abbey, and 3 collegiate churches. Pop. about 6,000

CAMPO BELLO, an island at the entrance of Passamaquoddy bay, Maine. It is about 8 miles long, and belongs to New Brunswick. Between Head harbor and the main ship channel is a light-house.

CAMPO FORMIO, **CAMPIO FORMIO**, or **CAMPO FORMIDO**, a village near Udine in the province Friuli of the Austrian dependency of Venice, on the canal of Roja. A treaty of peace between France and Austria was concluded here in 1797.

CAMPO LARGO, a town of Brazil, in the province of Bahia, on the Rio Grande. A primary school was established here in 1882. Pop. 8,000.

CAMPOBASSO, the fortified capital of the Neapolitan province of Molise; pop. 9,000. It is situated in a fertile district on the ascent of a high mountain, 55 miles N. E. of Naples, possesses a collegiate church, 4 parish churches, 2 colleges, a hospital, an almshouse, and several convents.

CAMPOMANES, **PEDRO RODRIGUEZ**, count, minister, and director of the academy of history and mathematics founded by Philip V., born in 1728, died in 1802. By his talents he obtained an appointment in the post office, and gained considerable reputation by his treatise "On the Laws of Amortization," in which he advocated the right of the government to restrain the alienation of land in mortmain, which met with violent opposition from the clergy. He wrote also a treatise on the "Encouragement of Popular Industry" (Madrid, 1774), which was followed by one on the "Education and Encouragement of Artisans." These met the approbation of the king, and led to the throwing open of the American trade, the admission of other ports to the exclusive privileges enjoyed by Cadiz, the institution of a national bank, the admission of raw produce duty free, and other important changes in the Spanish commercial system. He filled several public offices, the most important of which was that of president of the royal council in 1788. In this capacity he took measures to bring the gypsies and other vagrants into compulsory industry; he alleviated the famine in Madrid, and gave great encouragement to agriculture. His efforts for improvement in the administration of various public departments met with success and gained him enemies, whose machinations ultimately compelled him to retire from public life.

CAMPOS DOS GOITACAZES, formerly called **SAN SALVADOR DOS CAMPOS**, a city of Brazil on the Parahiba; pop. about 4,000. It is surrounded by a sugar-producing district, and was constituted a city in 1835.

CAMPSIE FELLS, a range of hills in Stirlingshire, Scotland, reaching from the Forth at Stirling to the Clyde at Dumbarton, and having Loch Lomond on the W. Their extreme length is 25 miles, with an average breadth of 7 or 8; and they rise to a height

of 1,500 feet, having on the 3 sides of their summit the sources of the Carron and Endrick rivers. Near the E. extremity of these hills lies the battle-field of Bannockburn.

CAMPUS, in Roman antiquity, a common public park, or vacant space near the city for shows, combats, exercises, and similar uses. Ancient Rome possessed 8 *campi*. The term is derived from the ancient Sicilian word for race-course.—**CAMPUS MARTIUS** was the most celebrated of the *campi* of ancient Rome. It lay outside of the walls of Rome, and consisted of the level ground between the Quirinal, Capitoline, and Pincian mounts, and the river Tiber. It received the appellation *Martius* from its being consecrated to the god Mars. It was originally set apart for military exercises and contests. Here the *comitia centuriata* assembled in mass meeting, and subsequently the *comitia tributa*; here stood the *villa publica* for the use of the Roman magistrates and the foreign ambassadors, who were not permitted to enter the city limits. It gradually became a suburban pleasure-ground for the Roman public, and was laid out with gardens, shady walks, baths, a race-course, and theatres. Julius Cæsar built there marble halls for the *comitia*, Agrippa erected the first public baths and the Pantheon, Augustus Cæsar the Egyptian obelisk and his own mausoleum, and Statilius Taurus the first amphitheatre of stone. Under the later emperors the place became crowded with public buildings, and subsequently with private residences also. Among the former, the most celebrated were Domitian's temple of Minerva Chalcidica, and Antoninus's pillar. Under Aurelian, the *Campus Martius* was enclosed within the city boundaries. *Campo Marzo* is the name given to one of the districts of modern Rome on the northern part of the old *Campus Martius*.—**CAMPUS SCÆLERATUS**, the polluted field, a place beyond the walls of ancient Rome, where vestal virgins who had been untrue to their oaths of chastity were buried alive.

CAMSINGMOONS, a Chinese seaport town, in Canton province, pop. 5,000. It is built on a small island called Keewong, and has a pretty good harbor, which was formerly much resorted to by vessels engaged in the opium trade.

CAMTOOS, a river of Cape Colony, S. Africa. It rises in the Nieuwveld mountains, and after a course of about 200 miles enters the Indian ocean.

CAMUCCINI, **VIOLENZO**, an Italian painter, born in Rome about 1775, died there Sept. 2, 1844. His most celebrated works were on subjects taken from Roman history. Among them were, the "Infancy of Romulus and Remus," the "Death of Cæsar," and the "Death of Virginia."

CAMUS, **CHARLES ÉTIENNE LOUIS**, a French mathematician and mechanic, born at Cressy, Aug. 25, 1699, died in Paris, Feb. 2, or May 4, 1768; was educated at the college of Navarre, in Paris, afterward pursuing the office of a teacher and examiner in the schools of that city. He accompanied Maupertuis and Clairaut

in their expedition to Lapland to measure a degree of the meridian there. His papers in the memoirs of the academy are generally on mechanical subjects, and are of great value. He also published a "Course of Mathematics," and an "Elementary Treatise on Arithmetic." In 1760 he was nominated perpetual secretary of the academy of architecture, and in 1765 member of the royal society of London.

CAMWOOD, a red dye-wood principally imported from the vicinity of Sierra Leone, obtained from a leguminous tree, called by Du Roi *Cordia bicolor nitida*. The coloring matter is with difficulty imparted to water, silk or linnen. Alcohol and alkaline solutions readily extract it. It is usually kept in the ground state.

CANA, the name of 2 ruinous modern towns in Palestine, one about 9 miles N. of Nazareth, the other only about 3½ miles N. E. of Nazareth. It is uncertain which of these, if either, is the scene of the first miracle of Jesus, as recorded in the New Testament. Dr. Robinson gives that honor to the first-mentioned Cana, now known as Cana-el-Jelli. Stanley, in his "Siam and Palestine," thinks the claims of the two about equally divided.

CANAAN, that part of the promised land which lay between the Mediterranean on the W., the Jordan on the E., the desert of Shur on the S., and Syria on the N., inhabited by the descendants of Canaan, the son of Ham. See PALESTINE.

CANADA, the most important province of British America. The attempts to explain the derivation or the meaning of the name have, for the most part, been equally unsuccessful and unsatisfactory. Most modern writers who have attempted a solution of the enigma have adopted the explanation of Father Hennepin, a Recollect missionary, who accompanied La Salle in the voyage of discovery from Fort Frontenac, the site of the present city of Kingston, to the Mississippi. According to the story of this priest, the Spaniards were the original discoverers of Canada; but on landing and finding that the country did not come up to their expectations, they expressed their disappointment by remarking, *Il capo di nada*, which Hennepin translates *Cop de rien*. Had his acquaintance with the Castilian tongue been more familiar, he would have been aware of the fact that 3 of the 4 words are not Spanish but Italian. Several modern writers on the subject have repeated the error of Hennepin, and adopted his explanation of the meaning of the word as the true one. Earlier authorities, with better means of information, had given a more satisfactory explanation of the philological difficulty. To the river St. Lawrence the name Canada was originally applied, and there is respectable authority to prove that this was also the name of the country which it watered. Lesarbot, the oldest historian of Nouvelle France, tells us that the Gaspeians and the Indians who dwell on the borders of the bay of Chaleur called themselves

Canadaguen, which the French rendered *Canadaquois*, giving it a certain correspondence with *Souriquois* and *Troquois*. Lesarbot, rejecting the theory of Jacques Cartier, the discoverer of the country, that Canada signifies town, and that of Belle Forêt that it is the equivalent of earth, concludes that the true meaning of the word is province or country, and that it is applicable not only to the country lent also to the river, which was sometimes called Hochelaga, and sometimes the St. Lawrence; the latter name having been given in consequence of a French navigator entering it on St. Laurent's day. This opinion seems the better founded from the circumstance that the country, on both sides of the St. Lawrence, was called Canada by the Indians, on its first discovery by the French.—In 1858, the limits of Canada were disputed, on the N., the W., and E. The line between the province and New Brunswick has since been settled by commissioners, and confirmed by an act of the imperial parliament. The boundary on the N. and W. is still disputed. On the N. the province is bounded by the uncertain and unestablished line of the Hudson's Bay company's territory. This boundary question is (Aug. 1858) about to be submitted to the judicial committee of the privy council, in England, for decision. The eastern boundary is formed by the gulf of St. Lawrence, and a line drawn from Anse au Sablon, near the extremity of the straits of Belle Isle on the Labrador coast, due N. to lat. 53°. On the W. Canada is bounded by an arbitrary and zig-zag line, which separates it from New Brunswick by the state of Maine, with a line for the most part equally arbitrary, the only points where any thing like a natural division occurs being a branch of the St. John's river and the ridge which separates the waters of the St. Lawrence from those of the Keenebec; by the states of New Hampshire, Vermont, New York, Pennsylvania, Ohio, Michigan, Wisconsin and Minnesota. Along the whole of the latter part of the southern frontier—except a short distance between Lake Superior and the Mississippi—there are lakes and rivers: Ontario, Erie, Huron, Superior; the Niagara, the Detroit, the St. Clair, the Sault Ste. Marie. All the islands in the rivers Mistouche and Restigouche belong to New Brunswick. The western boundary of the province, commencing at the northern limits of Minnesota, runs N. to the southern boundary of the Hudson's Bay company's territory. This boundary was fixed by an imperial statute known as the Quebec act of 1774; and at that time, the source of the Mississippi not having been discovered, it was not known how far the line of water indicated extended N. It is now contended that Canada extends N. of the source of the Mississippi, and that consequently along the intervening space it has no defined western boundary. In such a case practised surveyors think there is no authority for producing the line either due N. from the source of the Mis-

Mississippi, or in the direction indicated by the slight curves of the upper portion of the river. The question of boundary to the W. as well as to the N. of Canada requires to be adjudicated upon by competent authority.—Though Canada has formed one united province since 1840, the distinction of Upper and Lower Canada, or Canada West and Canada East, is still kept up, for electoral, judicial, and other purposes. The dividing line between Upper and Lower Canada commences at Point au Baudet on Lake St. Francis, and runs between the counties of Glengarry and Prescott, in Upper Canada, and Vaudreuil, in Lower Canada, to the Ottawa; thence along the Ottawa to the Moose river, and thence due N. to the Height of Land. From Anse au Sablon the province extends N. W. to the upper extremity of Lake Erie (which is about 10° further S. than the starting point), about 1,486 miles. From this point the boundary line takes a N. W. direction to above the head of Lake Superior, a distance of 970 miles, making the total approximate length of the southern frontier 2,166 miles. The distance from the E. extremity of the province to Quebec is about 788 miles; from Quebec to Montreal, 150 m.; from Montreal to the mouth of the Niagara river, 337 m.; thence to Lake Erie, 25 m.; from the E. end of Lake Erie to the mouth of the river St. Clair, 286 m.; thence to Lake Huron, 80 m.; thence to the E. end of Lake Superior, 320 m.; across Lake Superior, to the presumed W. boundary of the province, 270 m. The width of the province, for the reasons already stated, cannot be accurately given. Where the gulf of St. Lawrence ends and the river commences, has yet to be determined by commissioners for the international purposes of the reciprocity treaty of 1854, by which American citizens are secured in the right of fishing in the gulf. At some points, this noble river, which ranks among the finest in the world, spreads out to a width of 40 miles; at others it contracts to one mile. It has 8 outlets, the principal of which lies between Cape Breton and Newfoundland; the narrowest is the gut of Canso, which divides Cape Breton from Nova Scotia; the 8d, consisting of the straits of Belle Isle, divides the Labrador coast from Newfoundland. This river is navigable for sea-going vessels as far as Montreal, a distance of nearly 600 miles. Above Montreal several extensive rapids occur. They can be descended by the largest steamers which navigate Lake Ontario; but as no force of steam is sufficient for their ascent, it has been necessary to construct canals, near the sides of the river, to overcome them. These canals, with that intended to overcome the falls of Niagara—the Welland—have been constructed at a cost to the province of \$14,000,000, the whole of them having been directly built as government works. By the aid of these canals, and that constructed at the Sault Ste. Marie, between Lakes Huron and Superior, vessels may descend from the head of the

latter lake into the ocean; and as a matter of fact, several vessels have recently gone from Chicago, on Lake Michigan, to Liverpool.—Lake Ontario—formerly called Skanadaria, in the Iroquois language, meaning beautiful lake—has a length of 180 m., a breadth of 60, and a circumference of 500; an average depth of 500 feet, and an elevation of 234 feet above the level of the sea. Lake Erie, or as the Iroquois were accustomed to name it, Tajocharontiong, has a length of 260 m., a breadth of 68, and a circumference of 700; an average depth of 250 feet, and an elevation of 565 feet above the level of the sea. Lake Huron is partially divided by the group of Manitoulin islands; one main body of water lying to the S. and another to the N. The N. portion is again divided into E. and W., of which the former constitutes the Georgian bay, with a length of 190 m., a breadth of 50, and an area of about 6,000 sq. m. The N. channel has an area, exclusive of islands, of 1,700 sq. m., making the whole area of this lake 21,000 sq. m. Its length from S. to N. is 252 m., its width 190, and its average depth 860 feet. Its elevation above the sea is now, according to the measurements of the state engineers of Michigan, 578 feet, 8 feet more than the Canadian estimate makes it. The modern name of this lake is easily traced to its origin. It took the nickname which the French gave to the Yendots or Wyandots, on account of the manner in which they dressed their hair, resembling the *hure*, or wild boar. By these Indians it was called Karegnondy. Lake Superior, the largest of the chain, has a length of 860 m., a breadth of 140, a circumference of 1,500, an average depth of 1,000 feet, and an elevation of 627 feet above the level of the sea. The Indian name of this lake was Algona. Lakes Ontario and Erie are connected by the Niagara river; Lakes Erie and Huron are connected by the Detroit river or strait, and the river and lake St. Clair, the shallow flats of which offer one of the greatest impediments to navigation by large vessels which are encountered in these waters. Lakes Huron and Superior are connected by the Sault Ste. Marie. At this latter point, the N. W. company had a small canal, on the Canada side, for canoes and boats, half a century ago. The height of land at Portage du Frairie, near the source of the Superior, is 871 feet above the level of that lake. Before reaching Lake Winnipeg, there is a fall from this point of 841 feet, so that Lake Winnipeg is 80 feet below the level of Lake Superior.—Over the interior of Canada lakes of smaller size are profusely scattered. A list of some of these, the elevation of which has been determined by the geological survey, may not be out of place. A chain of lakes stretches across what was formerly known as the Colborne district, comprising the counties of Prince Edward, Peterboro, Northumberland, and Victoria. They empty by means of short streams, through the Otonabee river, Rice lake, and the river Trent, into Lake

Ontario. Balsam lake, in the township of Bentley, falls into Cameron's lake; Cameron's, in Petchen, into Sturgeon lake; Sturgeon, in Fensden and Verdun, into Pigeon lake; Pigeon, in Harvey, into Deer bay; Buckhorn lake, in Ennismore, Smith, and Harvey townships, into Deer bay; Channing or Mud lake, in Roumiers and Smith, into Buckhorn lake; Deer bay, in Smith, into Salmon Trout or Clear lake; Stony and Salmon Trout lakes, in Hamner and Berleigh, into the Otomabee river and Rice lake; the latter lake, which lies in the townships of Munguelan, Alnwick, Hamilton, and Otomabee, empties through the Trent river into Lake Ontario. The waters of Lake Simcoe, which is situated in the township of Cartwright, are also tributary to Lake Ontario, through the Otomabee river, which is navigable from Peterboro to Rice lake and the channels below. The highest of this chain of lakes has an elevation of 588 feet, and the lowest an elevation of 626 above Lake Ontario. Several years ago the Canadian government made some improvements in this chain of waters, with the view of forming them, by the assistance of canals, into a navigable link for connecting the waters of Lake Ontario with those of the Georgian bay. The attempt was, however, abandoned; but even now this route, as a means of connecting these two great bodies of water, has its advocates, in opposition to those who favor the construction of a canal from Toronto to the Georgian bay, as well as to those who contend that the natural route is by the Ottawa and French rivers. The occurrence of other series of lakes, not far distant, serves to show how exceedingly well watered is the part of the country in which they are situated, a remark which would be almost equally true of any other portion of the province. For even in the most rugged parts of Lower Canada, the mountains are frequently cleft by rivers and bear picturesque little lakes upon their slopes or summits, while springs bubble out of their naked heights or scantily covered steep, and silvery waterfalls may be seen through breaks in the foliage. The more level parts of Upper Canada abound in creeks and rivers, even where small lakes are absent.

—After the St. Lawrence, the Ottawa, one of its tributaries, is the largest river in Canada. Having its embouchure at the upper extremity of the island of Montreal, it has a N. W. direction for a distance of between 500 and 700 m.; official estimates, which aim at precision, make it 680 m. It drains, in its course, by the aid of tributaries, an area of from 70,000 to 80,000 sq. m. This valley forms the most extensive pine-producing region in the province; the supplies being so extensive as to be practically inexhaustible. Lumberers had penetrated as far up the stream as Lake Temiscaming, in 1846. To the E. its tributaries are separated by a ridge from those of the Saguenay, with which and the St. Maurice it heads in the highest of land which divides the waters of the St. Law-

rence from those of Hudson's Bay. Lake de Quize is supposed to be the common source of these rivers, a supposition which rests mainly on the information and birch bark charts of the Indians. There can be no doubt, however, that the servants of the Hudson's Bay company must be personally in possession of the facts regarding the exact location of the source of the Ottawa. In the first 250 m. from its head waters to Lake Temiscaming, it receives the waters of several tributary streams. Its width is most irregular, and in many of its links the river is lost in lakes through which it flows. In one place, for a length of 40 m., it has an irregular width of from 1 to 10 m.; in another stretch of 50 m., it expands into an average width of 6 or 6 m.; in another link of 20 m., it has a width of from 2 to 10 m.; again, for a distance of 45 m., it has a varying width of from 2 to 12 m. One of its most extensive lakes, Lake Temiscaming, with a length of 87 m., tapers off from a width of 6 m. to 500 yards, having at another point a width of only 200 yards, and at a third is reduced to the same width by the occurrence of an island. Again, for 17 m., the width is from $\frac{1}{2}$ to $\frac{1}{4}$ mile. Along its course, the Ottawa presents many portages, where the waters contract to a width of 40 or 50 yards, and are precipitated over rocks, sometimes forming beautiful cascades. Below Lake Temiscaming, the Rivière de Moine is its largest tributary; following its course, it has a length of 40 m. from the mouth of the Mattawa, and consists of a chain of lakes connected by short narrow streams. The further extremity of that forming the summit level of the chain, indifferently called Trout or Turtle lake, approaches within 8 m. of Lake Nipissing. The Ottawa has been rendered navigable in stretches, by the construction of canals to overcome falls or rapids, a considerable distance above Ottawa city (late Bytown). An opinion prevails in Canada that the Ottawa river and the Georgian bay will one day be united, by canalising the narrow strip of land that divides a principal tributary of the Ottawa from Lake Nipissing, and improving the navigation of the Ottawa and French rivers. With this view, the Canadian government has undertaken a survey of the whole line of water. The Gatineau, which empties a few miles below Ottawa city, is one of the largest tributaries of the Ottawa. If the Ottawa is sometimes swelled up in the lakes which it traverses, the French river consists of little else than a continuous chain of long, narrow lakes, rising by gentle elevations one above another, having for connecting links short rapids or falls. Through this lake-encumbered river the waters of Lake Nipissing glide into the Georgian bay, there being a fall of 69 feet in the distance of 50 m. Lake Nipissing, which has fallen 5 feet 9 inches below its ancient level, has an elevation of 617 feet above the level of the sea at Three Rivers, the highest point on the St. Lawrence at which the tide is perceptible. The Upper Trout lake,

a leading tributary of the Ottawa, has an elevation of 26 feet above Lake Nipissing, within 8 m. of which its nearest border is situated. Thus, in order to obtain a navigable passage the whole distance from the outlet of the Ottawa to the Georgian bay through Lake Nipissing and the French river, an elevation of 672 feet would have to be overcome in the ascent to the Upper Trout lake, and thence to Georgian bay a fall of 94 feet; making a total lockage of 766 feet.—The French river has 4 known distinct outlets in the N. E. part of Georgian bay, the widest apart of which are separated by a distance of 14 or 15 m., and the Indians allege that there is another to the W. Along its whole length, except about 10 m. of the upper portion near Lake Nipissing, it has 2 channels, separated at some points by an interval of 3 or 4 m. The occurrence of islands in the lake-links of this river often contracts the channel to a few yards' width. From its outlets, the general direction of the river is N.E., but its course is subject to considerable irregularities, being sometimes in the N. channel nearly due W., and at others nearly due S. Both channels are interrupted by rapids and falls, rendering necessary in the ascent of the S. channel 7 portages; the ascent of the N. channel is less difficult, and in the descent only 2 portages are necessary in either channel.—The 8d great navigable river of Canada is the Saguenay, at the entrance of which is the ancient port of Tadousac, which had become noted in Europe before the foundation of Quebec. As it lies further down the St. Lawrence than Quebec, it was, for some time after the discovery of the country, often visited by French vessels, which did not ascend as far as Quebec. The river has an average width of about $\frac{1}{2}$ of a mile, with high precipitous banks presenting, with the tall figures and dim shadows of the succession of mountains which extend as far as the range of vision sweeps, a picture of grand, desolate, and rugged beauty. It is navigable for ships of the line as far as Chicoutimi, a distance of 75 m. At this point, the ebb and flow of the tide are nearly as great as at the confluence of the river with the St. Lawrence. The St. Maurice, which falls into the St. Lawrence on the N., at Three Rivers, has been surveyed a distance of 380 m. It is navigable for a few miles at its mouth; after which the navigation is interrupted as far as Grand Piles, a distance of 44 m. from its embouchure; then there is another navigable stretch of 75 m., on which a steamer runs. Lumbering operations have been carried up this river a distance of 150 m.; and for this purpose its tributaries have been explored and surveyed through an area of over 14,000 sq. m. The valley drained by this river is as large as the whole of Scotland; and it is estimated to contain as much arable land as that country. Extensive slides and booms have been constructed by the government for the convenience of the lumber trade. The Bemisite or Bemis river, situated below

the Saguenay, is another large tributary of the St. Lawrence, flowing from the N.; though a navigable stream, no larger craft than canoes are found upon its waters. The Rideau river, which falls into Lake Ontario at Kingston, running in an inverse direction to the St. Lawrence, from which, near its mouth, it is divided by a narrow strip of land, was made navigable for military purposes, as far as Ottawa city, by the supplementary aid of the Rideau canal. The work was undertaken by the British government, and cost about \$7,500,000. This canal has long since fallen into almost absolute disuse; and has recently been conveyed to the Canadian government, who would not have consented to assume the burden of its maintenance, if they had not received as an equivalent a large quantity of valuable ordinance lands.—The peninsula of Upper Canada, though well watered by a profusion of small streams, is almost entirely destitute of navigable rivers. The Thames, which falls into Lake St. Clair, is navigable for propellers as far as Chatham, a distance of 80 m. The Grand river, which falls into Lake Erie, has by artificial aids been rendered navigable for small craft as far as Brantford. Lake Simcoe, marked on old French maps Lac Toronto, lies nearly due N. of Toronto, and may be said to form the E. limit of the peninsula. It has a length of 40 and a breadth of 30 m., with an average depth of 125 feet. It is divided by a strait from Lake Couchiching on the N., and is connected by means of the river Severn with Georgian bay. The principal rivers which fall into Lake Huron on the N. are the Thessalon, the Missisaga, the Serpent, the Spanish, and the White Fish rivers. Their mouths range from 15 to 30 m. apart. Of the 5, the Spanish river is the largest; it is the only one that is navigable, and even it is not capable of floating craft drawing more than 5 feet; by such vessels it is navigable 25 m. The White Fish river consists of little else than a series of lakes. Its upper waters have an elevation of 775.55 feet above the sea. The Muskoka has 2 outlets, if not more; it traverses 7 lakes in its course, and has 8 for its head waters, which have an elevation of 1,405.85 feet above the level of the sea.—The province is traversed, in its entire length, by a mountain chain which divides the country into 2 great basins, the N. and the S. basin, of which the former is the more considerable in the lower part of the country, and the less extensive before the W. frontier is approached. This range, to which the name of the Laurentian mountains has been given, runs along the N. bank of the St. Lawrence river, near its margin, from the Labrador coast to Cape Tourment, near Quebec. From this point, the range recedes N., running 60 m. behind Quebec, and 80 m. behind Montreal. Thence, following the line of the Ottawa for a distance of 150 m. from Montreal, it crosses that river at Lac du Chat; then taking the opposite direction it returns S. to the St. Lawrence, a little below the point at

which Lake Ontario discharges its waters into that river. From this point, it runs in a N. W. direction to the S. E. extremity of Georgian bay; then forming the E. shore of that bay, it passes beyond to lat. 47° N.; whence, taking a W. direction, it passes Lake Superior, and runs in a N. W. direction to the Polar sea. This range crosses the St. Lawrence at the point where it returns to it after crossing the Ottawa; and the Thousand Islands, which there seal the former river, may possibly be considered as so many of its fragments. Between this point and Lake Champlain, it comprises the Adirondac mountains. On the S. side of the St. Lawrence, commencing near the E. extremity at Gaspé, is another range of mountains, considerably broken, running parallel with the river, and passing, higher up through the Green mountains of Vermont, into the higher range of the Alleghanies, which divide the waters of the Ohio from those of the Atlantic. On the river Chatte, one of the peaks has an elevation of 5,768 feet, and a spring bubbles out within a short distance of the summit. At some points the mountains rise to an elevation of 2,689 feet, close to the banks of this river. From this point Notre Dame range is distant but 12 m., and from the most elevated peak it presents a wild confusion of mountains cut by ravines, through which the waters of numerous lakes and springs tumble into the St. Lawrence. The Laurentian series of mountains, on the N. side of the St. Lawrence, have at some points an elevation of from 4,000 to 5,000 feet. This elevation is attained between Quebec and Lake St. John; but this is at a point where the rivers, including the Jacques Cartier, are 5,000 feet above the level of the St. Lawrence, and in general the range is much lower. The height of land which divides the continents of the St. Lawrence from those of Hudson's bay, is far from presenting a continuous mountain range, as was until recently supposed. It consists, for the most part, of a ridge of table land, on which the courses of the waters which run N. and S. interlock and overlap one another, sometimes for considerable distances. At some points the heights have now been ascertained by actual survey. At Portage du Prairie, above Lake Superior, the elevation is 1,498 feet over the level of the sea. The ridge decreases in height eastward. The highest point in the peninsula of Upper Canada, along the line of the Great Western railroad, is about 700 feet above Lake Ontario. A line surveyed on the plateau of Lake Erie shows an elevation of only 200 feet, at the highest point, over Lake Ontario.—Beside the great valleys which lie to the N. and the S. of the Laurentian series of mountains, there are several transverse valleys, formed by rivers flowing into the St. Lawrence on the N. side, such as the Saguenay, the St. Maurice, and the Ottawa. The Saguenay, for some 60 m. is a walled river, and presents no valley all the points of Grand lac and Chicomini are reached; but with the St. Maurice it is differ-

ent.—The rock-formations present in Canada comprise representatives of the azoic and lower palaeozoic divisions, with the drift deposit, and some erupted masses of granitic and trappean rocks.—*Azoic Formations.* These, in an ascending order, comprise the Laurentian and the Huronian rocks of Canadian geologists. The Laurentian series of crystalline rocks constitutes the oldest formation met with in Canada. It consists chiefly of micaceous and hornblende gneiss, with subordinate strata of compact feldspar, mica, and talc schist, quartzite, crystalline limestone, and dolomite. These are considered to be ancient sedimentary beds, rendered crystalline by metamorphic action. They contain various accidental minerals, as garnet, tourmaline, corundum, &c., and valuable iron ores. Here and there, intrusive masses of granite occur among the series. The general direction of this formation has been already stated; and it only remains to add that, at a point W. of French river, it is overlaid by the Huronian formation. It appears again on the E. and N. shore of Lake Superior, and stretches far up to the N. and W. It thus occupies by far the larger portion of the province. This formation, having a general N. W. and S. E. direction as already stated, divides the province into two great basins—the S. and the N. basin. These Laurentian rocks are chiefly of importance in an economic point of view, from the large and valuable beds of iron ore (principally the magnetic oxide) which they contain, more especially in the townships of Belmont, Madoc, and Hull. At McNab on the Ottawa, also, and other places, red iron ore is met with; and among the other economic substances of this formation, we may cite the marbles of Arnprior and Grenville, the large mica plates of the latter locality, and the sulphate of baryta of Lansdowne, Ruthurst, and McNab. As a general rule, the districts over which the Laurentian rocks prevail are ill adapted for agricultural occupation. Fertile soils can only be expected to occur in association with the beds of crystalline limestone or decomposing feldspar, belonging to the series. Overlying the Laurentian formation along the N. shore of Lake Huron and many parts of Lake Superior, various slates, sandstones, and conglomerates occur, with a few bands of limestone, and thick intercalated beds of trap. To these rocks, collectively, Sir William E. Logan has applied the name of the Huronian series. Their entire thickness amounts in places to about 12,000 feet. Numerous trap dikes, beside the intercalated masses of trap already mentioned, traverse these rocks at many localities. The whole formation is eminently copper-bearing. Native copper is found in it, about Lake Superior; but the chief metalliferous deposits occur on Lake Huron (Bruce mines, Wallace mines, &c.), and furnish copper pyrites, purple copper pyrites, and sulphida of copper, in great abundance.—*Palaeozoic Formations. Great Southern Basin.* It has been stated above that the principal water-shed or high land of the Laurentian district,

running in a general north-westerly direction, divides the province into 2 great basins, the S. and the N. basin. Sir William E. Logan has shown that the palaeozoic rocks of the S. basin admit of being divided naturally into 2 subordinate basins, by an anticlinal axis which runs in a north-easterly direction from Lake Champlain, and strikes the St. Lawrence a little below Quebec. The strata W. of this line offer a remarkable contrast to those on the other or E. side. They are nearly horizontal, and follow one another conformably from the lower to the upper silurian, and from these latter to the Devonian series. In the E. basin, on the contrary, the rocks are much disturbed, and are rendered crystalline in many places by metamorphic agency. Beside which, there is a want of conformability between the lower and the upper silurians; and also, as occurring in Gaspé, between the Devonian and the carboniferous strata.—*The Western Basin.* The rock groups of this basin comprise the lower and upper silurians, and, in the western peninsula, a portion, also, of the Devonian formation. In an ascending order we have, first the Potsdam sandstone, the lowest of the fossiliferous rocks; then the calciferous sand rock; the Chazy limestone; the bird's-eye, Black river, and Trenton limestones; the bituminous slaty strata called the Utica schist; and the series of shales and sandstones, with subordinate limestone beds, termed, collectively, the Hudson river group. These form the lower silurians, developed chiefly along the St. Lawrence, from a short distance below Quebec, around the river Ottawa, and in the country between Lake Ontario and Georgian bay. The Trenton limestone covers the widest area, and is of the most importance. The upper silurians begin with the Medina sandstone, which sweeps from the S. shore of Lake Ontario, in a thin band, by Queenstown, Hamilton, &c., to the W. of Owen sound. This is followed, still further to the W., by the Clinton and Niagara group of shales and limestones. Next comes the Onondaga group, still to the W., with its valuable gypsum deposits. Then follows the conchiferous limestone, occupying a large portion of the N. shore of Lake Erie, and an equally large portion of the shores of Lake Huron. This closes the silurian series. Of the succeeding Devonian rocks one division, that of the Hamilton shales, a series of bituminous slaty rocks, is alone developed to any extent in western Canada. It covers a broad area in the counties of Lambton, Middlesex, Essex, and Kent. Here and there it has been found to underlie small patches of the Chemung and Portage group, so largely developed in the adjacent peninsula of Michigan. Most of these rocks yield good building materials. Lithographic stone also occurs in the Chazy limestone, especially around Marmora; and the same division has likewise furnished some good marble. The Trenton limestone has also yielded marble of excellent quality. From the Niagara group

the well-known Thorold cement is obtained, and large quantities of gypsum are exported into the States, from Cayuga, Oneida, and other townships situated upon the Onondaga group of rocks. Finally, in the Devonian rocks of Enniskillen, &c., many petroleum springs occur, and also some valuable deposits of asphaltum.—*The Eastern Basin.* In the area E. of the anticlinal axis already alluded to, the rock divisions comprise the Trenton limestone, the Hudson river group, and a series of quartzose sandstones and red and green shales, known by the name of the Sillery group. This group has not been recognized in the W. portion of the province. In the E. it forms almost the entire line of the S. shore of the St. Lawrence. It is succeeded unconformably in Gaspé by upper silurian limestones, followed by an enormous thickness of sandstones and shales belonging to the Devonian formation. On these Devonian rocks, also in unconformable stratification, rest about 8,000 feet of coarse sandstones, representing the lower portion of the carboniferous group. More inland, as in the eastern townships, many of the beds belonging to the Hudson river and Sillery groups have undergone remarkable alterations. They are converted into micaceous, chloritic, and talcose schists, and also into serpentines and various feldspathic and hornblendic rocks. The more important economic minerals of this metamorphic region comprise chiefly the iron ores of Bolton and Brome; the 50 feet bed of magnetic and titaniferous iron ore of Beauce and Vandreuil; the chromic iron ore of Bolton and Ham; the argentiferous copper pyrites of Upton; the argentiferous galena of the Chaudière valley; and native gold, diffused over a wide area. Magnesite, fine marble, slate, &c., occur also in the district. In this region, likewise, and extending into the western basin, are many erupted masses of igneous rock, forming the picturesque mountains of Yamaska, Shefford, Brome, Belœil, Montreal, &c.—*The Drift and Alluvial Formations.* Thick deposits of clay and sand, with boulders or transported masses of gneissoid and other rocks, cover the formations of both the eastern and western basins in most parts of the province. These deposits belong to the transitional period between the close of the tertiary and the commencement of the present epoch. They contain some valuable economic substances, chiefly beds of bog iron ore, as in the Three Rivers district, and in the county of Norfolk, on Lake Erie; likewise, shell marls and peat. The clays of London, Toronto, Oubourg, Kingston, and other places yield, also, good white bricks.—*The Northern Basin.* This basin, as already stated, lies to the N. of the high land or water-shed which traverses the Laurentian district in a general N. W. direction. Its geology is still very obscure. The formations known to occur within its area comprise the Laurentian series, the Huronian rocks, and the upper silurians. The lower silurian system has not yet been recognized;

hence the inference of Sir William E. Logan, that the high range of Laurentian country, from the coast of Labrador to the Arctic coast, forms the N. limit of the lower sturrian sea.—The total amount of public lands in Upper and Lower Canada, now at the disposal of the government, is about 175,000,000 acres, of which a little over 6,000,000 acres have been surveyed. Much of the remainder has been but imperfectly explored. The quantity of lands in the hands of private individuals is over \$4,000,000 acres. The crown land department estimates the extent of the area drained by the St. Lawrence river and its tributaries at 210,441,823 acres. The territorial extent of Lower Canada is much greater than that of Upper Canada, the former comprising 184,412,500 acres, and the latter, within the water-shed of the St. Lawrence and the lakes, 77,605,400 acres. These figures, though official, are necessarily only an approximation to the truth; for precise accuracy must be impossible so long as the N. boundary of the province is undetermined. The undisposed of surveyed lands of the crown in Lower Canada lie chiefly in the valley of the Saguenay, in the rear of the seigniories, on the Ottawa and its tributaries, and on the S. side of the St. Lawrence, between the settled seigniories and the line which divides the province from New Brunswick and the state of Maine. A small portion also remains in that part of the country which is known as the Eastern Townships. The unsold surveyed lands of Upper Canada lie principally in what is sometimes called central Canada, in rear of the frontier settlements on Lake Ontario, and between the Ottawa river and the Georgian bay, and N. of Lakes Huron and Superior. The western peninsula, which for a considerable time absorbed almost all the immigration the country received, is now held almost entirely by private individuals. With an excellent soil, well suited to the production of every kind of grain, and growing wheat in great abundance, it presents scarcely any waste, and a very large proportion of it is already under cultivation. It has been justly regarded as the garden of Canada; the good influence of the surrounding bodies of water harmonizing with the natural richness of the soil.—The line of settlements extends from the river St. Anne, on the S. side of the St. Lawrence, to the W. extremity of the E. shore of Lake Huron proper. The valley of the St. Lawrence, being most accessible, was naturally first settled; and until the conquest of the country by the English, nearly a century ago, the settlements of the French were principally confined to the banks of that river; the banks of the Detroit formed almost the only exception. On the St. Lawrence, the subdivision of the land has been carried to as great an extent as in most countries of Europe—to a far greater extent than in England; and the result is, that for hundreds of miles, the banks of the river present the appearance of a continuous

village, the bright-aimed spires of the Catholic churches rising above the white houses and glistening in the sun, at regular and not distant intervals. Since the conquest, partly from antipathy of race which sprang from a contact with the original French colonists, and partly because the lands along Lake Ontario and in the upper peninsula invited settlement by their superior fertility and a less rigorous climate, the new bands of English colonists who followed in the footsteps of Wolfe wended their way westward. These causes have ever since continued to influence the immigrant population; and the result is, that while the western peninsula is all taken up, the fine valley of the St. Maurice, with its 3,500,000 fertile acres, with the exception of the devastations of the lumberer, was, until the last few years, left to its original barbarism. Below Kingston, very little autumn wheat is sown, the climate being unsuited to its production, and spring wheat almost exclusively prevails. Attempts, not entirely unsuccessful, have been made to grow autumn wheat in the valley of the Saguenay, at Chicoutimi; but they prove nothing. On the Escomains river, below the Saguenay, good crops of all kinds of grain have been raised. Similar experiments are now being made with success, in the county of Chicoutimi, nearly as far N. as Lake St. John. What proportion of the 175,000,000 acres of crown lands yet undisposed of is capable of cultivation, and comes under the term arable, must necessarily be unknown till a much larger portion of it has been surveyed. The N. basin is attracting settled men on the upper Saguenay. The peninsula of Gaspé, which is as large as that of Denmark, and which lies advantageously with respect to Europe, has been much neglected. The S. portions of it are sheltered by the mountains of Notre Dame. S. of this range is an irregular plateau of table land, having an elevation of from 1,000 to 1,500 feet, varying in width from 10 to 50 m. On the N. side of the mountains, the valley on the bank of the St. Lawrence is settled as far as the river St. Anne. At this river the range divides; a branch running to the S. for some distance, and then advancing to the shore at Mont Louis, continues E., its altitude declining till it terminates in Cape Gaspé. The valleys and the slopes of the hills generally present a rich soil, free from stones; but the inequalities of surface form an obstacle, not insurmountable, perhaps, to settlement. The steepness of the hill sides, even where the mountains do not extend, is often such as to put cultivation out of the question. That portion of the W. border of the peninsula which fronts on the county of Bonaventure, presents a surface and soil as favorable for settlement as any other portion of Lower Canada, where public lands are available. Good crops of excellent grain can here be raised at an elevation of 1,000 feet above the level of the sea; and it has been stated on official authority that, with equal cultivation, the produce is 20 per cent.

greater here than in other parts of Lower Canada. Wheat raised in this peninsula was classed high enough, at the Paris exposition in 1855, to obtain honorable mention. The climate, except on the coast, which is exposed to the cold winds and fogs of the gulf, is every way as favorable as at Quebec, and the winter milder. Above the Restigouché, there are about 110 m. of coast unsurveyed. Squatters have spread themselves over $\frac{1}{3}$ of the distance. A considerable proportion of the inhabitants of this peninsula are engaged in fishing; they confine themselves principally to the shore, the deep sea and mackerel fisheries being abandoned to American enterprise.—Of the interior of the county of Tadoussac, which extends on the N. bank of the St. Lawrence, from the E. boundary of the province to the Saguenay river, a distance, following the coast line, of about 600 m., but little is known. It covers an area about twice as large as Scotland. Its features are mountainous and rugged; it is watered by large rivers, and in some places bears an abundance of pine timber; the latter fact affording evidence that it is capable of producing grain. Over the greater part of this extensive region, the Esquimaux is supreme. Hunters tell of a hard-wood region bordering on the Saguenay country.—The valley of the river Saguenay covers an area of 27,000 sq. m., and is estimated to contain over 3,500,000 acres of arable land, lying chiefly in the N. interior basin which has Lake St. John for its centre; it is known as the upper Saguenay. It is protected from the fogs and cold winds of the gulf by the mountains of St. Marguerite and other high lands. To the S. the range of Laurentian mountains, rising in places to an unusual height, renders the country, to the width of from 50 to 80 m., almost valueless, and until the valleys of the rivers were followed, it was almost utterly inaccessible. A practicable line of road has, however, at length been found. Protected by the high mountain ranges, the valleys and table lands enjoy a milder climate than the settlements on the St. Lawrence, 2° further S. On the shores of Lake St. John, the climate is said to be less severe than at Quebec. It is not yet ascertained how far N. in the interior valleys successful cultivation is possible. Almost every description of agricultural produce has been grown in the neighborhood of Lake St. John. The Saguenay, to which attention has of late years been directed by colonization societies in Lower Canada, already produces grain beyond the wants of its population.—Colonization societies form a curious feature in the social and political economy of Lower Canada. They are, in fact, joint stock farming associations, with a share capital, and all the machinery of a directory and general management. There is one at Quebec, another at L'Islet, and a 3d in Kamouraska. That of Quebec has chosen for the scene of its operations the rear part of the county of Montmaguy, on the S. side of the St. Lawrence.

These associations sprung out of the gregarious character of the French Canadian population. Accustomed to a regularly organized society, they have no taste for isolation, and when they move into the wilderness, which they do with the greatest reluctance, and not until the paternal estate has been subjected to the minutest subdivision which will afford a chance of humble subsistence, they wish to carry the entire frame-work of the old society with them, the regular parish, the church, and the priest being essential constituents.—Between the Saguenay and Three Rivers very little land has been surveyed, in the rear of the settled seigniories, on the bank of the St. Lawrence. The townships near Quebec contain, on the slopes of the Laurentian range, some good hard-wood land. The deep streams that intersect this range form no wide valleys, and there is little alluvial soil on their banks. Between the St. Maurice and Montreal, the hard-wood land on the Laurentian slope becomes lighter; in the valleys, at their base, sand and clay prevail, and there are broader alluvial flats along the streams.—From Cape Chatte to Mitis, on the S. side of the St. Lawrence, no considerable quantity of vacant lands occurs. The reverse is true of the country from the Chaudière and the Kennebec road to Mitis. Within this stretch there is a tract of country, between the rear of the seigniories on the St. Lawrence, and the southern boundary of the province, 200 m. long, and from 12 to 40 m. wide. It contains over 1,000,000 acres of surveyed lands unsold; and a larger quantity still has yet to be surveyed. Being cut longitudinally in the centre by the mountains of Notre Dame, which here rise in scattered and detached groups, considerable portions of it are rugged and poor, the mountain summits sometimes rising over 4,000 feet above the level of the sea. The best soil, which is covered with hard-wood, occurs in the depressions which intervene between the different elevations of the series. The best lands occur along the boundary line of the United States. To these interior lands 6 leading roads have been made by the government.—In the next section of country westward, which lies between the Chaudière and the Richelieu rivers, in the rear of the seigniories on the St. Lawrence, and which is known as the Eastern Townships, the mountains of Notre Dame again present themselves in the same detached and fragmentary shape, being cut transversely by the valleys formed by the Chaudière and the St. Francis rivers. Here the valley of the St. Lawrence, on the S. bank, is about 20 m. wide; and the hilly country, which presents here and there summits 2,000 feet high, has a width of about 80 m. To the S. lies a valley, parallel to the great valley of the St. Lawrence, about 80 m. in width, drained by the Chaudière and the St. Francis. It has an advantage over the valley of the St. Lawrence in point of position, lying further S., and favored by a protecting range of broken

mountains to the N. This section is about the only point in Lower Canada which an English-speaking population has occupied. There remain less than 1,000,000 acres of surveyed lands undisposed of, and a still less quantity to be surveyed. A considerable number of squatters have gone upon the surveyed portion, and of what is not sold or occupied, there is a good deal of waste. The general character of the country is gently undulating, except on the banks of the rivers, where there are extensive flats of inferior soil. Some idea of the picturesque character of this section of country may be obtained from the fact, that from one point, the summit of Oxford mountain, which has an elevation of over 4,000 feet above the St. Lawrence, no less than 16 small lakes can be seen.—The valley of the St. Maurice is officially estimated to contain 3,500,000 acres of arable land. Situated on the N. side of the St. Lawrence, midway between the cities of Quebec and Montreal, its position is in many respects favorable, commanding ready communication with Upper Canada, the United States, and Europe. Up to a very recent period, the value of this fine territory was almost entirely unknown, both to the people and the government. The immediate flats of the river in some places contain poor soil; but at a distance of 2 or 3 miles, high ridges of heavily timbered land present themselves. In other places the banks of the river are of the most fertile soil. In the track of the lumberman, the farmer has, as usual, followed; and good wheat and other descriptions of grain have been grown. Above some of the branches of the river rise fine stretches of table land. In one place, a settlement of 14 miles suddenly sprung up along a road opened by the government. Indeed, until recently, one of the great obstacles to the progress of settlement in Lower Canada has been the want of roads. In one part of the district in question, the woods have been devastated, for a large distance, by fire. Settlements have within the last few years been formed at several points. Large rivers, lakes, alternations of alluvial and table land, the absence of elevations rising to the importance of mountains, the Laurentian range excepted, heavy timber of which pine forms a large proportion, are among the principal features of this extensive valley. The richest soil is to be found on the alluvial banks of the lakes and rivers, and in the other lower grounds, which occasionally merge into swamp. There are some famous mineral springs. In the pine forests, 1,000,000 square feet of red and white pine are sometimes prepared during a winter. But this business has only just commenced, the territory having been open to commerce hardly 6 years.—The great valley of the Ottawa contains a settled population of not over 120,000 souls. The settlements have not extended over 60 m. above the city of Ottawa; and they exist in the proportion of two to one on the S.W. side of the river. On the N. E. side a strip from 4 to 6 m. wide of low land, of good quality, extends 120 m.

above the city of Ottawa. This strip, as well as the islands of Calumet and Allumette, of which the soil is similar in quality, has for the most part passed into the hands of private individuals. Below and above this strip, the country becomes hilly and even occasionally mountainous. The exploration into the interior has here been very imperfect, the country being altogether unknown at a distance of 70 m. except on the rivers Du Lièvre and Gatineau. It is described as being in many places steep, rocky, and stony, 75 per cent. of it being unfit for cultivation; and whatever there is of good occurs in such detached portions as only to be available for agricultural purposes in connection with the surrounding lumber trade. Up the Gatineau river 140 m., pine becomes scarce and then disappears entirely. Some parts of the upper valley of this river are covered with poplar and beech, alternating with pine; others present nothing but erratic rocks and precipitous hills. The lower valley of the Gatineau, as well as that of the river Du Lièvre, contains excellent agricultural lands. The settlements on the Gatineau will soon extend a distance of 100 m.—The extensive district lying between the Ottawa river on its S. W. side, and the Georgian bay, is the one to which settlement is now chiefly directed. Extending 500 m. above the city of Ottawa, and having a base N. of the frontier settlements of Lake Ontario of equal extent, its width at the upper end is about 100 m. It contains large tracts of fertile land, is not cut by mountains, and produces a great variety of timber. This district has been distinguished into white pine and red pine and hard wood countries, owing to the prevalence, in different places, of these different descriptions of timber. The white pine country lies to the E., and the red pine immediately W. of it. The soil of the red pine country is sandy and poor, gravelly or stony, with a rugged, uneven, and rocky surface. The other division contains a mixture of good and tolerable land, generally fit for agricultural purposes. Excepting where tracts of hard wood land occur at intervals, the red pine country is pronounced, on official authority, unfit for settlement. W. of these two divisions lies the hard wood country. Among the timber which gives its name to this section are interspersed belts of red pine, the white having totally disappeared. This strip extends W. at one point 75 m., and has a length of 120 m. from S. E. to N. W. Between this strip and the Georgian bay lies a belt of from 20 to 30 m. in breadth, of barren soil, frequently terminating in naked rock near the shores of the bay. To the S., near the ridge dividing the waters of the Ottawa from those which flow directly into the St. Lawrence, belts of poor, rugged, stony land, about 20 m. in width and unfit for settlement, occur.—Between Lake Nipissing and Lake Opoung, about $\frac{2}{3}$ of the land is fit for cultivation; the timber being for the most part hard wood. This whole region of country between the Ottawa river and the Georgian

bay is well watered, and the rivers afford much hydraulic power. Altogether, it is the best district of country E. of Lake Huron for agricultural purposes. A railroad to connect the Ottawa with the Georgian bay has been projected; and the government has granted a wide strip of land, on each side, toward its construction. This grant was made in 1856; but the railroad has not yet been commenced. It is proposed to extend it to Quebec. On the N. and W. of Lake Nipissing, the land is good; but on the French river it is rocky and barren. The timber trade of the Ottawa is immense. During the 9 years from 1848 to 1856 inclusive, 84,500,000 sq. feet of white pine was sent from the upper Ottawa to Quebec; 25,590,000 cubic feet of red pine, which predominates over the white, and 2,286,690 feet of other timber. The whole amount cut during that period would fall little short of 800,000,000 feet. It has been calculated that there is available in the valley of the Ottawa about 48,000,000 tons of such timber as is now taken to market, and about 180,000,000 tons of smaller size. In other words, the existing growth, without making any allowance for additions, would support a trade equal to that now carried on for a century to come.—The westernmost section of the province, comprised within the valley of the St. Lawrence and the lakes, lies on the N. of Lakes Huron and Superior; having a length of 410 m. from the mouth of the French river on the E., to Pigeon river on the W. Its uncertain breadth is estimated at 160 m., and its area is about 84,000 sq. m. Following the coast line, the length is 600 m., of which 150 m. are on Lake Huron and the river Ste. Marie, and 420 on Lake Superior. The N. shore of Lake Superior presents a bold, rugged coast, of which the cliffs and eminences vary from 800 to 1,800 feet in height. It presents great diversity of scenery in these varying heights, which rise close upon the margin of the lake, deep indentations, sheltered coves, and clusters of islands. The harborage presented is ample for every purpose. The timber, consisting chiefly of spruce, balsam fir, white birch, poplar, and cedar, is generally of little commercial value. Some of the higher points are bare of trees, and the land available for agricultural purposes is chiefly confined to the flats and valleys at the mouths of the streams. Between the Batchewana and Goulais bays and the Missisaga, the country is fine, producing hard wood on the ridges, and presenting in the broad, alternating flats a deep alluvial soil. Among the hard wood, there is a sufficiency of white pine for building purposes; the flats are principally covered with cedar, tamarack, ash, elm, soft maple, and birch, except where small prairies, bearing a luxuriant growth of grass, intervene. It is probable that this section of country will, at no distant day, be settled. The whole country, where it has been surveyed and explored, from Lake Superior to Lake Nipissing, presents, among the rugged and broken portions that in-

tervene, many extensive valleys of excellent land, well adapted for settlement. And even in the more ragged and less prolific portions groves of fine pine timber are frequently met, and indications of mineral wealth present themselves. The government surveyor, by whom this extensive section of country has been traversed, recommends that settlements should commence at the west and be carried down eastward. The finest land in the whole distance occurs from the rear of the village of Ste. Marie, bounded on the W. by the Batchewana bay, and on the E. by the Missisaga river. It is easy of access from Lakes Superior and Huron and the river Ste. Marie. The valuable copper mines on the N. shore of Lake Superior have been almost entirely neglected, and much has yet to be done in the way of exploration before the extent of the mineral wealth can be known. The Indians appear to possess some secrets regarding the mines; but they persistently refuse to disclose them, having a vague fear of the consequences of their doing so, as if they were conscious of the wrongs which the Spaniards inflicted on their race in South and Central America and the West India islands, in compelling them to perform the labor of slaves in the gold mines, and dreaded a similar fate. N. of Lake Huron the hills occasionally attain an elevation of from 400 to 700 feet above the lake. The surfaces of these hills are generally rounded, but occasionally they exhibit rugged escarpments with surfaces of naked rock. The slopes are often gentle, and the valleys wide, the soil of the latter being either a fine sandy loam or a deep deposit of decomposed vegetable matter, with the subsoil of blue clay. The valleys are sometimes crossed by ridges, varying in height from 40 to 150 feet. The valley of the Spanish river presents important facilities for settlement; all the land being of good quality or bearing a rich crop of excellent pine, for which a ready market might be found at Chicago and other places. Mill sites for the manufacture of timber exist in abundance.—Canada is rich in fisheries; but it is a branch of industry which has not yet been turned to much account. The obstructions of rivers, and the barbarous methods of fishing pursued, have done much to reduce the productiveness of this source of wealth. Lately the government has devised plans for the protection of the fisheries, and agents to superintend them have been appointed. The river fisheries are hereafter to be leased, and the revenue derived from this source given as bounties to the deep sea fisheries, which the Canadians have hitherto almost entirely abandoned to the French and the Americans. The produce of the fisheries on the Canadian side of Lakes Ontario, Erie, and Huron, was, in 1857, a little short of \$500,000. The kinds chiefly taken are trout, salmon, white-fish, pickerel, and herring. It will give some idea of the abundance of white-fish in Lake Ontario, if we state the fact, recorded on official

authority, that 47,000 of these fish have been taken at one haul, on Wellington beach, in the county of Prince Edward. The salmon fisheries of the St. Lawrence and its tributaries have been wantonly devastated by netting and spearing on the spawning beds. The Lower Canada superintendent of fisheries estimates that, under a proper system of protection, the salmon fisheries of Lower Canada may be made to yield nearly \$500,000 a year.—The climate, although subject to considerable extremes of heat and cold, is not unfavorable to the success of agricultural operations. All the cereals are produced in the greatest perfection. The best wheat-growing district is the peninsula of Upper Canada. In Lower Canada the Hessian fly, and other enemies of the wheat crop, have produced terrible devastation. In the first year of the present century, Lower Canada produced 1,000,000 bushels of wheat in excess of its own wants; but at the end of the half century such a check had been given to the production of this cereal that that section of the province was only producing half enough for the consumption of its own population. For a period of 10 years the mean summer temperature at Toronto was 61.61°, ranging from 63.00° to 66.81° F. The mean maximum summer temperature, for the same period, was 85.26°, ranging from 81.5° to 88.8°. For 7 consecutive winters the mean fall of snow, at the same place, was 57.3 inches; the 2 extremes being 68.2 and 43 inches. The mean winter temperature at Toronto, during the months of December, January, and February, is 25° 51'. The great lakes produce an ameliorating influence on the climate of the Upper Canada peninsula which they form, as is shown by a comparison of temperature with other places to which their influence does not reach. The temperature of the surface water of those lakes, never below 30°, is more frequently over 33°, which is 7 or 8 degrees over the mean temperature at Toronto. The effect of these waters on the temperature may be judged from the fact that, on the Niagara river, the winter temperature does not fall over 2 degrees below the freezing point of water. At Quebec the thermometer occasionally falls 60° below 0 in winter, and in summer rises to 104° F. The Laurentian series of mountains forms a wall of protection from the icy winds of Davis's strait, Hudson's bay, and the Po-
